you'd not only want the
service yourself, but you'd
have it. Let us tell you
about it.

**Hardwood Record
Chicago**

MICHIGAN

FAMOUS FOR HARD MAPLE AND GREY ELM

CADILLAC GRAY ELM

was used for finish in the living room of the Michigan-Wisconsin Bungalow at the Chicago and New York Forest Products Expositions.

The wood has an attractive figure, shows delicate shadings, is peculiarly susceptible of color staining, and when properly finished gives a decidedly rich effect.

The lumber is of excellent quality, easy to work, and, unlike other varieties of elm, it does not check, shake, twist or warp more than ash or oak.

It is used extensively for furniture and interior finish.

We will send you prepaid finished samples of Cadillac Gray Elm if you would like to see this beautiful native wood.

The STEARN'S SALT & LUMBER CO. LUDINGTON, MICH.

LOUISVILLE

THE HARDWOOD GATEWAY OF THE SOUTH

Are You in the Market for Mixed Cars?

Louisville happens to be one of the best places in the country to buy mixed cars, on account of the location of the market and the number of woods carried in stock in large quantities here. Another reason is the co-operative methods that are used by members of this trade, enabling all of the stocks in the market to be made available in handling any one order.

Business conditions just now are favorable to purchasing in mixed cars, so that the user need not buy a full carload of each item needed by his factory. The mixed car proposition fills the bill in every way, and gives him an opportunity to travel more lightly, in the respect of investment in raw material, than would be possible otherwise.

Louisville can furnish anything that is wanted in quartered and plain red and white oak, poplar, chestnut, cottonwood, ash, hickory, walnut, gum and all other hardwoods. Southern planing mill owners may be interested to know that a considerable stock of Northern birch is carried here, and that orders for this wood can be filled promptly.

A floor to adore

 For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.
 Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free
The T. Wilce Company

SAVE YOUR MONEY BY USING THE
RED BOOK Published Semi-annually in February and August
 It contains a carefully prepared list of the buyers of lumber in car lots, both among the dealers and manufacturers. The book indicates their financial standing and manner of meeting obligations. Covers the United States, Alberta, Manitoba and Saskatchewan. The trade recognizes this book as the authority on the line it covers.
 A well organized Collection Department is also operated and the same is open to you. Write for terms.

What Veneer and Panel Consumers Will Use in 1914

This information is shown in our service of veneer and panel consumers' requirements lists—complete according to 1914 requirements.

The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us give you the details.

HARDWOOD RECORD,

CHICAGO, ILL.

American Black Walnut NOW

The time is ripe for consumers of cabinet woods to add American Black Walnut to their line. The leaders in the trade have set the pace; retailers are already stocking up—and are advertising it, and supply and prices are favorable. The war has made it impossible to get Circassian walnut in anything like adequate quantities, and the domestic wood is the logical substitute. Every factor favors the use of American Black Walnut. It's your move! Note stocks, ready to ship, in the hands of leading producers:

NASHVILLE

THE LOGICAL PLACE TO BUY HARDWOODS

THE following is a list of stocks offered to the consuming trade by the hardwood lumbermen of Nashville. The character of the timber from which Nashville hardwood men secure their stocks places them in a peculiarly strong position as far as quality of lumber is concerned. Nashville lumbermen have always been noted for their strict adherence to all terms of sale, and in short have an enviable reputation for making good both as to the quality of lumber and as to grading.

The members of the Nashville hardwood trade solicit your attention to these facts and an opportunity of demonstrating their truthfulness.

Band Sawn Hardwoods

WE PRODUCE OUR OWN STOCKS

Our Specialties: Cottonwood, Red and Sap Gum, Oak—plain and quartered, red and white, Three Ply Red Gum Panels.

A Few Items We Want to Move:

- 10 Cars 4/4"x 6" to 12" 1st & 2nds Cottonwood.
- 8 Cars 4/4"x13" to 17" 1st & 2nds Cottonwood.
- 6 Cars 4/4"x18" to 22" 1st & 2nds Cottonwood.
- 10 Cars 4/4"x15" to 17" Cottonwood Box Boards.
- 5 Cars 4/4"x 6" to 12" Cottonwood Box Boards.
- 5 Cars 5/4"x 6" to 12" 1st & 2nds Cottonwood.
- 3 Cars 6/4"x 6" & wider 1st & 2nds Cottonwood.
- 3 Cars 8/4"x 6" & wider 1st & 2nds Cottonwood.
- 2 Cars 3/8"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 1/2"x 6" & wider 1st & 2nds Plain White Oak.
- 3 Cars 5/8"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 3/4"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 4/4"x 6" & wider 1st & 2nds Plain White Oak.
- 5 Cars 5/4" Log Run Soft Maple.
- 5 Cars 12/4" Log Run Soft Maple.
- 2 Cars 3/8"x 6" & wider 1st & 2nds Red Gum.
- 2 Cars 1/2"x 6" & wider 1st & 2nds Red Gum.
- 3 Cars 5/8"x 6" & wider 1st & 2nds Red Gum.
- 2 Cars 3/4"x 6" & wider 1st & 2nds Red Gum.
- 7 Cars 4/4"x 6" & wider 1st & 2nds Red Gum.
- 2 Cars 5/4"x 6" & wider 1st & 2nds Red Gum.
- 1 Car 6/4"x 6" & wider 1st & 2nds Red Gum.
- 1 Car 8/4"x 6" & wider 1st & 2nds Red Gum.
- 1 Car 3/8"x 4" & wider No. 1 Com. Red Gum.
- 1 Car 5/8"x 4" & wider No. 1 Com. Red Gum.
- 1 Car 3/4"x 4" & wider No. 1 Com. Red Gum.
- 6 Cars 4/4"x 4" & wider No. 1 Com. Red Gum.
- 2 Cars 5/4"x 4" & wider No. 1 Com. Red Gum.
- 1 Car 6/4"x 4" & wider No. 1 Com. Red Gum.
- 2 Cars 3/8"x 6" & wider 1st & 2nds Sap Gum.
- 3 Cars 3/4"x 6" & wider 1st & 2nds Sap Gum.
- 3 Cars 4/4"x13" & wider No. 1 Com. Sap Gum.
- 5 Cars 5/4" Log Run Plain Sycamore.
- 6 Cars 3/4" 1st & 2nds Plain Red Oak.
- 8 Cars 4/4" 1st & 2nds Plain Red Oak.
- 2 Cars 5/8" 1st & 2nds Plain Red Oak.
- 7 Cars 4/4" 1st & 2nds Plain Red Oak.

Review and Outlook

General Market Conditions

FROM REPUTABLE FINANCIAL SOURCES in New York comes the word that there is actually a discernible easing in the money situation at that pulse of the financial arterial system. This report does not seem to be substantiated as yet by any general developments, but it comes from such an authoritative source that it is distinctly worthy of mention. If it is an actual fact, it is unquestionably the most important development within the past couple of weeks.

The banks have been pretty severely criticised all over the country for the extreme tightness in the money situation, but there is room for doubt as to whether or not this criticism is entirely warranted. It is true that thousands of entirely legitimate and perfectly solid enterprises have been really embarrassed and inconvenienced by the arbitrary attitude of the banks, but on the other hand it must be remembered that were money as accessible as during more normal times, there would unquestionably be thousands of mushroom enterprises started; there would be expansion where expansion is not good business policy, and in general the entire likelihood of artificial inflation of business, which would quite possibly result disastrously for the whole commercial structure of the country.

If the above reported easing in financial circles is true, it is probably the result of a realization on the part of the controllers of the money situation that the rough edges have been worn off, and the country has started on a period of well-balanced plans of thinking and that in general business men are in a position to use money more intelligently and to better advantage for the country at large than when the composite business mind was thrown out of its normal plane by the calamitous happenings abroad.

Market advices from representative points during the past week establish two most pertinent facts. The first is that commercial bodies everywhere are putting forth their very best efforts—are utilizing their keenest intelligence and most thorough training for the purpose of outlining in an intelligent, scientific and business-like manner plans for taking full advantage of what opportunities are offered to this country in fields of export which have not as yet been exploited to any extent whatever. From everywhere come reports of meetings of commercial bodies for the definite and specific purpose of solving this problem as expeditiously as possible, but primarily in an intelligent and permanent manner, so that the trade which will be worked up will be established on a permanent basis and along lines which will to a degree mitigate the ill repute of the exporting business which our American business men have felt for so many years. With the thought of the entire commercial structure concentrated on these plans, it is simply a question of time when definite strides in the direction of increased foreign trade in new fields will

be made, and judging from actual accomplishments up-to-date, this period of time will not be unduly long.

There have been especially gratifying reports of actual shipments of any number of American commodities, the orders for which can be filled only in this country. Of course it is to be considered that this business came naturally because this is the logical place now to secure such equipment as is used by the armies abroad and which the belligerent nations can not now manufacture. However, actual orders and actual shipments to date have aggregated a very substantial sum in dollars and cents.

As far as the export lumber business is concerned, it is true that the month of August showed a very alarming falling off as compared with the month of August, 1913, and that the month of September was even worse. But statements of leading exporters indicate beyond dispute that so far in October unofficial estimates establish the fact that the tide has already begun to turn, and that there are considerable quantities of forest products now going abroad. Of course, this trade is limited entirely to those of the warring nations who control shipments on the Atlantic ocean. However, the possibilities there are many and seemingly are increasing. It cannot be claimed, of course, that exports even approach normal volume, but at a time such as this when exporters look for nothing but absolute cessation of business, even a fair volume of business at fairly remunerative prices offers a gratifying tone to the situation.

The other point which our advices have demonstrated and have shown to be a fact, is that actual figures on building operations indicate the building situation in the country to be much more favorable than has been the case for some time. The last issue of HARDWOOD RECORD called attention to the probability of this development and it is very gratifying to be able to state that specific reports prove the entire truth of this surmise. There is, of course, only one meaning to this development, namely, that the demands for lumber will be augmented materially. Consumption will be kept up on a very fair plane, and the excuse for haphazard slashing of prices will be obviated.

The average lumberman has been looking for an absolute cessation of all orders and has waited with crossed fingers for the clap of doom. However, as each day goes by he may receive an order here and an order there, and he begins to see a little ray of optimism in the situation and to actually believe that dire calamity has not yet reached us, and that there is a real hope that it will be side-tracked in time to prevent disaster.

The tone of the lumber trade is difficult of analysis. It consists of strong mixtures of optimism and pessimism, but the proportion seems to be shifting in favor of the optimistic element. This seem-

ingly is rather a psychological development as the extreme downheartedness of a very fair proportion of lumbermen has resulted more from changed conditions than from actual hard times. They have found it difficult to accommodate themselves to different methods of purchasing. They have been used to going out and placing good sized orders at fair prices, and can not get used to the unsatisfactory small order. They have never been peddlers and find it difficult to adapt themselves to what might be described as the necessity for peddling their wares. However, it seems that this condition of mind is changing and that they are getting some measure of satisfaction from even a small sale of lumber. If the truth were generally known, the actual aggregates in a good many cases would count up to proportions which are not at all unsatisfactory, considering what the rest of the world is going through.

As to prices, unfortunately it must be admitted that lumber is not being sold for what it is worth. On the other hand, the sawmill man as a general thing is to be warmly commended for what is the almost general policy of holding stock for what he thinks is a fair market value wherever it is possible to do so. This point has been touched on heretofore, but it is increasingly apparent that this is the policy of the majority of the better class of sawmills in the North and South. That they are in a position to figure on this basis is an absolutely indisputable fact. Their stocks average only normal. The consumers' stocks are practically nil. Many mills are shut down and are now non-producers. Hence there is absolutely no reason for presuming there will be any country-wide accumulation of stocks. This argument in favor of fair prices is impossible of circumventing. It should be borne in mind by every manufacturer in dealing either with the consumer or with the wholesaler, and it should be borne in mind by every wholesaler.

One fortunate side of the financial tightness is the fact that it is preventing to a very large degree speculative lumber buying. Large wholesalers announce that they are doing practically no buying except where bargains are being forced upon them, but in a good many cases this same class of concerns would buy if they were able to secure sufficient money for speculative purposes. The tendency of this condition then is to keep down the bargain sales of lumber.

It is difficult to say much that is new in this report as conditions are shaping themselves slowly, but **HARDWOOD RECORD** firmly believes that the last two weeks have seen real accomplishments by the American business men as a whole, and that the country has made rapid progress in its effort in adapting itself to the changed conditions. **HARDWOOD RECORD** has not been able to see during this fortnight anything that can be argued as presaging the deeper submerging in the mire of business stagnation. Lumber prices are not good, it is true, but any changes which have been reported on actual sales, with of course here and there the usual exceptions, have been changes for the better.

It seemingly would not be a wise procedure to prophesy notable developments during the remainder of 1914, but **HARDWOOD RECORD** believes that when the next year is two or three months old, American lumbermen will have experienced to a gratifying extent the benefits of the tremendous advancement which American business will have felt. Between now and then is the time to make plans for taking full advantage of increased opportunities.

The Cover Picture

SHOWS A PERIOD OF LOW WATER in the Big Sandy. There is not much sand in sight within the area shown in the cover picture of this number of **HARDWOOD RECORD**, but, nevertheless, the name of the river is not misleading. The sand from which the stream is named occurs lower down the river's course; but the origin of some of it is apparent in the picture. It was washed from the faces of the cliffs or ground from the boulders in the channel. There is not enough current visible to do much grinding, but the photograph was taken in time of drought. When the floods come, there are plenty of power and material for grinding sand.

The Big Sandy river is the joint possession of three states, Virginia, West Virginia and Kentucky. It forms the boundary between the two latter states for many miles along its lower course. Its

tributaries flow from the mountains, valleys, glens, ravines, caves and forests of the three states. It is a region wild and beautiful. Much of it is primeval forest, and it is peopled by mountaineers, many of whom live in much the same way as their ancestors before them. It is of interest that the first English-speaking army that ever set foot on the banks of the Ohio river marched one hundred and fifty-eight years ago down the identical defile shown in the picture. The marching was rough, but the moceasined, single-file Virginians, under their Scotch leader, General Andrew Lewis, got through. The descendants of those soldiers live in these mountains yet.

The Big Sandy region has long been famous for its timber. The picture does not show the best, because the faces of the cliffs do not grow that kind; but it is found among the coves and fertile valleys farther back. Well-informed timbermen have said that the finest yellow poplar in America is found on the tributaries of the Big Sandy river. Enormous quantities have been taken out since lumber operations were commenced there half a century ago. Much has been floated down the streams in times of flood and has reached sawmills on the Ohio river. Artificial floods have been created by building splash dams, and log drives of spectacular proportions have been forced down the rocky channel. Without such assistance the logs would lie stranded for months at a stretch. During recent years railroads have penetrated the region, and the streams are less important than formerly as a means of log transportation.

Among the Delta Mills .

SPECIFIC REPORTS from almost two hundred sawmills operating in the Delta states of the Mississippi river, which while on the face are rather startling, augur well for the immediate future of the hardwood business at least as far as that part of the country is concerned. Actual figures show that out of 189 letters received from such concerns, 126 are now shut down definitely, 21 are running on short time, and 28 on full time.

It can easily be seen from this that southern operators are planning to play safe under present conditions. The most important thought, however, comes from the contemplation of the future. With stocks at consuming points used up almost day by day, with about three-fourths of the mills in that section non-producing, it can readily be seen that there is no possibility of any great accumulation of hardwood lumber.

Of equal importance is the report on hardwood stocks now on hand in the same mills. Of those reporting, 47 stated that their stocks are over normal, 45 stated that they are about the same as usual, and 45 that they are less than usual. Considering that on an average the mills replying are of equal importance as far as production is concerned, it is definitely shown that the hardwood stocks in the delta country are at the present writing practically normal.

There is one idea suggested by this combination of circumstances which above all others should impress itself upon the sawmill men and the wholesaler. That is, with only a normal stock at the mills, with practically no stock to speak of at consuming points, with a fair amount of lumber actually moving, there can be no possible excuse for deliberately and voluntarily slashing prices, which would demoralize not only the wholesale and producing element, but the consuming element as well. There is not one consumer in a hundred who would not be far better satisfied to have lumber on a normal basis as far as selling price is concerned.

Here it seems is an excellent opportunity for establishing a fairly uniform market value for hardwood products, the value of which would be fair to the producer as well as to the consumer.

Action

FOLLOWING THE GENERAL OPENING OF HOSTILITIES among the warring nations, this country was flooded with a veritable tidal wave of suggestions and advice concerning the best method of procedure for securing to this country the fullest benefits which are justifiably due it as a result of the removal from the various world markets of competition of our commercial neighbors across the Atlantic. A good deal of this advice was general in character but was

more in the nature of effusions of a mock patriotic nature than of actual value to business men in solution of their new problems. On the other hand, there was a vast deal of information and innumerable suggestions which offered really helpful hints as indicating the proper procedure and legitimate courses to pursue in rounding up what may well be considered legitimately new trade abroad.

It has been generally admitted, however, that the only possible way of actually getting at the problem, after carefully reviewing and studying all phases in question, is to personally and exhaustively investigate the foreign markets at first hand.

Seemingly this condition has been fully realized by commercial bodies all over the country. HARDWOOD RECORD has been deeply gratified during the last few months to note the activity in this direction as reported by its correspondents in representative cities of industrial and commercial reputation in the North, East, South and West. Almost every news letter sent in for publication in this issue contained a report of a meeting of some commercial body, representative of the best business element of the representative cities, the purpose and plans of which meetings have been in each case to fully work out the possibilities of developing new business in heretofore uncultivated fields.

In every instance, also, the procedure has been entirely sane, the suggestions have been reasonable and the tone of the meetings definitely shows that American business men are going about the solution of this problem not in a haphazard, loose and unbusiness-like manner, but are taking the problem up logically and scientifically with the idea of establishing not a temporary trade, but one which will be continued for the years to come, because based on sound business principles and right dealing.

American business men have been in ill repute, and probably justifiably so, because of their lax method of handling foreign trade. They have not followed out their opportunities, that is, as a whole, in the careful, painstaking way which they require. They have not taken the trouble to adapt their methods to the methods in vogue in the countries in which they have attempted to do business. However, in the present instance they seem to have realized their past shortcomings, and if the plans now being mapped out are carried to completion along the lines which are being formulated, a new era will be developed in the relations of the American business man to the foreign consumer.

What One Month's Figures Show

THE STATISTICS OF IMPORTS AND EXPORTS for August of this year have been published and they show the effect of the war on trade between the United States and certain countries which are now at war, and between ourselves and others which are not directly involved. August was the first month of hostilities, and figures for the two months since then are not yet available, but the tendency of trade is indicated. In August, 1913, we exported articles to Austria aggregating in value \$1,026,386, and during the same month this year not one dollar's worth went to that country. Our imports for August last year from Austria were worth \$1,485,646, and this year \$880,506.

Practically all of that was upon the way when the war began, and reached our ports later. The exports to Belgium for August last year were valued at \$9,322,252, and this year they fell to \$432,527.

Regarding our trade with Germany, the August export figures last year were \$21,301,274; this year \$68,737; Russia, last year \$1,367,805 as exports; this year \$76,680. The ports of Austria, Germany and most of those of Russia were blockaded immediately after the beginning of hostilities, which accounts for the almost total stopping of their foreign trade. Belgium was not cut off from the sea, but internal affairs were so serious that trade immediately stopped.

France and Great Britain have control of the seas at present, and it is interesting to note, from a trade standpoint, what that means in a crisis like that which the world is now passing through. In August last year France exported to the United States merchandise valued at \$10,750,624, and this year to the value of \$7,420,800.

That was a decline of only one-fourth. Great Britain, including England, Ireland, and Scotland, sent us during August last year goods worth \$38,355,184, and for the same month this year, \$32,951,250, which is a falling off of only fourteen per cent. Great Britain's exports to this country declined in almost exactly the same ratio as its imports from us.

Denmark, Netherlands, Norway, Portugal, Spain, and Roumania shipped more products to this country in August this year than last, while Norway slightly increased its purchases from us, and Greece increased its nearly ten-fold. Great changes have occurred in the foreign trade of many countries which are not engaged in the war and are in little danger of being drawn in. Our imports from other countries of North America show substantial increase when August of this year is compared with the same month in 1913, but our exports to these countries have declined. The same state of affairs exists with regard to our trade with South America. We are buying more from them and are

selling them less than a year ago. Our trade with Asia as a whole has declined in both imports and exports. With the islands of Oceania it is still more apparent that we are not holding our own. Comparing August this year with that of last, we have bought twice as much from them and sold them only half as much. Such a balance of trade against us is not desirable. With Africa as a whole the situation is not encouraging from our standpoint. The balance of trade there is slightly in our favor, but it is not large. The fact may not be generally known, but so far as area may be taken as a measurement, Africa is at present more involved in the war than Europe. Ninety-five per cent of the continent is arrayed on one side or the other in the conflict. One-half of Asia, two-fifths of North America, and more than ninety-five per cent of Oceania are belligerents in the war.

Summing up our trade relations with the whole world, in a comparison of August this year with the same month in 1913, it is found that we have lost \$7,883,663 in our import trade, and \$77,539,780 in our export trade. For August 1913 the trade balance was \$50,257,467 in our favor, for August this year it is \$19,398,650 against us.

Pass It Along

Will you spend ten cents to help business? If so, read this and give us your co-operation.

We believe that fully ninety per cent of the present depression results from thinking war instead of thinking business. We believe not only that the removal of the chief stimulus to the thoughts of the war and its dire consequences will mean a tremendous forward stride for the business of this country, but also that it is entirely feasible to remove this cause of calamity talk and pessimistic thinking.

It is our unalterable conviction that the daily press of the country through everlastingly forcing the sordid details of the war upon the sensationally inclined American public, is keeping the war thoughts at a high pitch. While realizing the tremendous news value of war stories and so-called news, we believe the press of the country can be made to see the sound business sense and money profit for them in strangling the scare-head war headlines, relegating every stick of war news to the second and succeeding pages, making the outside of the paper, at least, look like a normal issue, thus restoring the American public to a condition approaching at least the normal, and preventing the hysteria of war talk.

If you will spend ten cents, what we want you to do is to select the names of three strong business acquaintances, not necessarily lumbermen; call in your stenographer now before you forget it, and dictate first a letter to the morning and evening paper you read, along the lines of the above suggestion, and then write to your friends making exactly the same proposition to them that we have made to you. Can you see what this will result in?

We have sent this as a letter to 200 lumbermen. If each man writes to three friends it will mean within a few days 600 letters, and each one of those three friends written to will write three more friends requesting them to follow the work right along. In a few days there will be an endless chain which will result in thousands of letters to the daily press, which would bring great pressure upon them to induce them to follow this course.

If you lend your assistance to this effort, the results of our letter will be multiplied a hundredfold. Are you with us?
HARDWOOD RECORD.

World Markets for American Lumber

BY HU MAXWELL

FIFTH ARTICLE

Editor's Note

The hundreds of islands, large and small, known collectively as the West Indies, offer exceptional advantages to the American lumberman who is desirous of increasing his foreign sales. That region is rich in articles raised for export, and is therefore able to buy liberally what it needs from abroad. It is fairly well supplied with hardwoods of its own, but not with softwoods. It is not a manufacturer of wood products. It sells its logs in the rough, and it buys furniture, farm implements, and vehicles. There lies the opening for American hardwoods. The softwoods of this country already have an opening which they are able to fill, and perhaps to enlarge. The field is free from rivals, and the only limit to the growth of our lumber trade in that direction is the desire and ability of the people of the West Indies to buy what we have to sell.

DURING more than four hundred years the West Indies have allured traders. In the first fifty years after the discovery by Columbus the Spaniards destroyed most of the native Indian population in an insane exploitation of the natural resources of the islands, chiefly the mines which were never very rich. Then followed the development of agriculture by slave labor brought from Africa, and incessant quarrels among European nations for possession of the best islands. The contestants were English, Spanish, French, and Dutch, and all but the Spanish retain possessions there. The United States has succeeded Spain in the ownership of Porto Rico. The West Indies still are divided among five foreign nations, including Denmark, while one independent nation, Cuba, holds nearly one-half of the total land area of the entire group of islands, and the two independent republics, Haiti and Santo Domingo, possess the island of Haiti.

West India trade has always been considered very valuable. England long counted her possessions there more profitable than all the colonies in what is now the United States and Canada. The islands bought enormous quantities of European manufactures and gave in exchange sugar, molasses, rum, dyes, and cabinet woods. The early history of that region was a record of long periods of trade rivalries between the different nations. It was not a peaceable competition in the markets, as is usually the case now; but there was public war, while piracy, buccaneering, and force of all kinds were used, without apology, to win trade from rivals. Cities were destroyed for scarcely any other reason than to put them out of business as trade rivals. Much of that ferocious work was done by English buccaneers, who were so nearly like pirates that the difference was hardly noticeable, except that they usually preyed on England's enemies, and enlarged their country's opportunities to secure business. A well-known English poet sized up the work done by the buccaneers in the following forceful lines:

“They diced with death. Their big sea-boots
Were greased with blood. They swept the seas
For England; and we reap the fruits
Of their heroic devilries.
* * * * *

“They laughed at odds for England's sake.
We count, yet cast our strength away.
One admiral with the soul of Drake
Would break the fleets of hell today.”

Among the earliest commodities sent to the West Indies were lumber, staves, and other cooperage. The raw material for these was not to be had in Europe, consequently, the eastern coast of North America supplied them, and after the Revolutionary war most of that trade passed to the United States, and we have held it ever since. Figures are quoted below which give the state of our West India timber trade today, which is an inheritance from the past centuries.

GEOGRAPHY OF THE WEST INDIES

The geography of the West Indies fits that region for commerce with the United States. The islands lie in three general groups south and southeast of our shores. The nearest are less than one hundred miles from the mainland, and the farthest less than two thousand. The total land area of the whole West Indies is about

100,000 square miles. There are more than 6,000 islands of all sizes, some of which are little more than rocks or sandbars, others large and fertile. They are scattered over an area of 1,200,000 square miles of water, consisting of parts of the Gulf of Mexico, the Caribbean sea, and the Atlantic ocean.

The principal divisions of the West Indies are the Bahamas, Greater Antilles, and Lesser Antilles. The Bahamas lie east and southeast of Florida, from seventy-five to five hundred miles distant. The group of islands is made up of twenty-nine of considerable size, 661 smaller, and 2,837 rocks and bars. The total area is 5,450 square miles, the population 53,735, of which 12,000 are white. The Bahamas belong to Great Britain, and are a portion of the area known as British West Indies. The formation is largely coral or the sand of pulverized coral. On some of the islands the negroes pry up the stone-crust surface with crowbars and pound it to pieces with hammers to provide soil for cultivation. The most elevated island in the whole group is 400 feet high, and is a dune of sand piled up by the wind. This is on Cat island, where some suppose Columbus first landed.

There are practically no springs or running streams in the Bahamas. The people depend on rain water and wells. As a whole, the Bahamas are poor in soil and products. The seat of government is at New Providence, which was once a famous rendezvous of pirates. Nassau is now a fashionable resort, particularly in winter. During the American Civil war it was the headquarters for blockade runners, to and from Confederate ports. From 1861 to 1865 there were 397 ships entered there after running the blockade, and 688 left there to attempt to break through the blockade. Many never returned.

As far as can be learned there is only one sawmill among the Bahamas. It is on Andros island, and saws Cuban pine (*Pinus heterophylla*), the kind that predominates in south Florida. The trees are small and the lumber is nearly all consumed near where it is cut or among the neighboring islands. Yellow pine from the United States competes successfully with it, at the very mill that cuts it. There is a supply of timber, such as it is, for several years at the present rate of cutting.

Some mahogany grows in the Bahamas, but the best was cut about eighty years ago. When the mahogany cutters in the Bahamas had stripped those islands, they passed into Florida and so thoroughly depleted the mahogany there that little has been cut in Florida since.

The Greater Antilles consist of Cuba, Haiti, Porto Rico, Jamaica, and numerous smaller islands of the same group. The Lesser Antilles stretch in a crescent from Porto Rico to South America, the largest and southernmost island of the group being Trinidad. They belong to the Dutch, British, French, and Danish.

WEST INDIAN WOODS

Only two West Indian woods are imported into the United States in considerable amounts, mahogany and Spanish cedar; but many others come in small quantities. However, the man who is contemplating the increase of his exports of lumber to the West Indies is not concerned so much with imports from that region into this country, as with the competition which his product must face when it reaches the markets on those islands. The people there will make use of what is at hand rather than buy imported lumber. For that reason it is proper to take account of some of the woods of the

West Indies which are in use there, and inquire whether they supply the people's wants or whether woods from the United States have a chance to gain in that market.

Probably as many kinds of trees grow in the West Indies as in the United States. There is great variety of hardwoods, but practically no softwoods, except two or three pines and cedars which are no match for similar trees of the United States. It may be stated, once for all, that so far as the people of the West Indies must have softwoods, like pine, fir, and spruce, they must be brought from other countries—which means the United States, though northern Europe may not be wholly out of the market. Softwoods have a foothold, and their chief problem consists in retaining what they have and increasing it.

It is far different with hardwoods sent from the United States to the West Indies. They meet numerous rivals, some of which are not forceful, but others are firmly entrenched in the markets and they will not be easily dislodged. The names of a few of these woods follow. The exporter of hardwoods to the West Indies will be apt to make the acquaintance of one or more of them in every market he enters, and the amount of business he will be able to do will depend upon his ability to crowd them out or to find buyers outside the native woods' list of users.

Ebony or poui (*Tecoma serratifolia*) is abundant in Trinidad, and is of both green and gray varieties. It may be had in logs thirty feet long and two or three feet in diameter.

Princewood or cyp (*Cordia geraconthus*) is one of the best woods in Jamaica for turnery. It is likewise made into shingles, and is of the same weight as white oak.

Yokewood (*Catalpa longissima*) is nearly twice as heavy as black walnut but in appearance resembles it, and is sawed into boards.

Manchineel (*Hippomane manchinella*) looks like hard, maple and is of about the same weight. It is made into furniture. The juice of the green tree is poisonous.

Olivier (*Bucida buceros*) is said to solve the problem of the fireproof shingle. It is claimed that the wood will not blaze.

Angelin coco (*Andira stipulacea*) is sometimes known as partridge wood, useful for canes and umbrella handles.

Waterwood (*Chinarria cymosa*) is used for cabinet work in St. Vincent.

Jiqui Comun (*Burnelia nigra*) is one of the hardest woods in the world. When freshly cut it is of the color of rosewood, but turns black with age. It is used for railroad ties, piling, and posts.

Mahogany is too well known to need a description.

Spanish cedar (*Cedrelia odorata*) is employed for cigar boxes in this country, but for furniture and building in the West Indies, where logs are cut twenty-eight feet long and two in diameter. It is not a softwood, like the cedars of the United States, but has broad leaves, which look somewhat like those of black walnut.

Blue mahoe (*Hibiscus elatus*) looks like ash, and is made into carriages and boats.

Lignum-vitæ (*Guaiacum officinale*) weighs nearly twice as much as white oak, and is exceedingly hard.

Satinwood (*Xanthoxylum ovum*) is found in the Bahamas.

Hackia (*Ixora ferrea*) weighs fifty-nine pounds per cubic foot, and grows in different parts of the West Indies. It is almost unbreakable, and is suitable for vehicles, canes, cogs, and fishing rods. It may be had in logs sixteen inches square and sixty-five feet long.

Bulletwood (*Mimusops globosa*) is a house-building wood, though nearly as hard as ebony.

West India boxwood (*Tabebuia pentaphylla*) is often called white cedar on its native islands, where logs are cut twelve inches in diameter. It is made into rulers and small handles.

Fiddlewood (*Citharexylum melanocardium*) is used by carpenters and wheelwrights in the Barbados.

Santa maria or galaba (*Calophyllum calaba*) resembles Spanish cedar and in Trinidad is used for the same purposes.

Sabicu (*Acacia formosa*) resembles mahogany and in Cuba is employed in boat building. It is not suitable for structural timbers, because of concealed cross breaks which develop in the growing tree.

Lancewood (*Guatteria virgata*) is very desirable for fishing rods and vehicles.

Degame (*Calycophyllum candidissimum*) is a cabinet wood in Cuba.

Quebra hacha (*Copaifera humenifolia*) is very heavy, and boat builders make deck beams of it, and it is likewise made into frames for heavy machinery. Cuba railroads lay it for ties.

The foregoing are the principal commercial woods of the West Indies, but more than ten times as many are found in those islands.

LUMBER EXPORTS TO WEST INDIES

It is impracticable to give the lumber exports to the smaller West India islands separately, but with the more important islands, like Cuba, Haiti, Jamaica, and Trinidad, this can be done. Most

of the smaller ones are reported by group according to ownership, as British, French, and Dutch. With this explanation, the following tables of exports of forest products annually from the United States to the West Indies will be understood.

WHITE PINE		
Country	Feet	Value
Cuba	1,629,000	\$ 68,853
Haiti	847,000	29,931
Santo Domingo	557,000	20,434
French West Indies	294,000	8,933
Trinidad and Tobasco	266,000	8,636
Jamaica	254,000	8,854
Dutch West Indies	185,000	6,315
Danish West Indies	130,000	4,099
Other British	32,000	1,115
Barbados	9,000	316
Total white pine	4,203,000	\$157,486

Most of the yellow pine which goes to the West Indies is longleaf, though others go also. The table which follows gives the exports of this pine to the West Indies in 1913:

LONGLEAF PINE		
Country	Feet	Value
Cuba	58,364,000	\$1,011,660
Jamaica	11,348,000	228,126
Trinidad and Tobasco	5,650,000	119,010
Haiti	5,231,000	129,019
Santo Domingo	5,062,000	132,820
French West Indies	3,899,000	89,658
Other British	2,546,000	58,569
Danish West Indies	1,192,000	27,026
Barbados	1,046,000	22,172
Dutch West Indies	208,000	4,655
Total yellow pine	94,546,000	\$1,819,715

Under this head is included the common shortleaf pine (*Pinus cchinata*) and likewise some loblolly (*Pinus taeda*). The figures are shown below.

SHORTLEAF PINE		
Country	Feet	Value
Cuba	547,000	\$ 8,921
Santo Domingo	249,000	8,932
British West Indies	41,000	1,246
Haiti	41,000	1,586
Dutch West Indies	30,000	1,037
Trinidad and Tobasco	19,000	612
Danish West Indies	9,000	376
French West Indies	7,000	343
Total	943,000	\$23,053

In making shipments of yellow pine to the West Indies, the precise species is frequently not stated. In that case it is listed simply as yellow pine, and in statistics of exports it is called "other yellow pine," and the figures for 1913 follow.

OTHER YELLOW PINE		
Country	Feet	Value
Cuba	76,717,000	\$1,455,620
Jamaica	2,389,000	51,292
Santo Domingo	1,193,000	33,057
Other British	1,039,000	21,146
Trinidad and Tobasco	529,000	10,580
French West Indies	354,000	6,965
Haiti	217,000	6,721
Barbados	74,000	1,493
Total	82,512,000	\$1,586,874

No spruce from the Pacific coast found its way to the West Indies in 1913; but it is probable that the opening of the Panama canal will bring the Sitka spruce of Washington into the West Indies markets. Most of that represented in the following table was the red spruce of West Virginia and northeastward, but doubtless there was some black spruce from Maine.

SPRUCE		
Country	Feet	Value
Santo Domingo	43,000	\$1,313,000
French West Indies	29,000	895,000
Haiti	16,000	695,000
Dutch West Indies	10,000	447,000
Other British	6,000	110,000
Jamaica	1,000	35,000
Total	105,000	\$3,465,000

HARDWOODS

Hardwoods make a poor showing in the exports from this country to the West Indies for the reason that those islands are well supplied with hardwoods of their own. The shipment of oak was almost negligible, although that wood is not found there in commercial quantities, other than live oak, the same species that grows in our southern states. It is of poor form for the sawmill. In 1913 Jamaica took 2,000 feet of our oak lumber at \$77.50 a thousand, and Santo Domingo 1,000 feet at \$60. Cuba bought 121,000 feet of yellow poplar for \$10,775, and Jamaica 4,000 feet for \$296. Cypress, which is botanically a softwood, though it is sometimes classed otherwise, was shipped to three of the islands last year. Cuba paid \$4,165 for 143,000 feet, Santo Domingo \$1,409 for 38,000 feet, and Jamaica \$38 for 1,000 feet.

OTHER TIMBER

There is considerable export of round and square timber to the islands. Trinidad and Tobasco took 38,000 feet of round logs, Cuba 77,000 feet, and 13,000 feet of hewed timber went to Cuba, together with railway ties worth \$175,546. The British possessions paid \$2,611 for ties. Joists and scantling were shipped to the British islands to the value of \$53, to Haiti \$2,721, and to Cuba \$4,391. Sawed timbers were shipped as follows to various parts of the West Indies:

Country	Feet	Value
Cuba	1,137,000	\$21,158
Haiti	37,000	1,307
Trinidad and Tobasco	31,000	589
Jamaica	28,000	487
Danish West Indies	11,000	472
Dutch West Indies	3,000	128
Total	1,247,000	\$24,141

ALL OTHER LUMBER

Exports to the West Indies of lumber which does not properly fall under any of the preceding classes are shown in the following table:

Country	Feet	Value
Jamaica	121,000	\$ 4,219
Other British	96,000	1,915
Haiti	81,000	3,880
Santo Domingo	74,000	2,829
Dutch West Indies	54,000	2,148
Cuba	29,000	1,373
Trinidad and Tobasco	22,000	750
Total	480,000	\$17,114

COOPERAGE AND BOXES,

Staves were one of the first commodities sent from the mainland of North America to the West Indies, and shipments continue. Molasses, sugar and rum were among the earliest products of these islands to seek world markets. The oak of the Atlantic coast from New England to Georgia, and later of the interior has supplied the barrels which have carried the products to market. The staves still go from the United States, and in recent years boxes have been added to carry fruit. Our exports of staves to the islands in 1913 are here shown:

Country	Value
French West Indies	\$174,284
Jamaica	62,975
Trinidad and Tobasco	41,247
Cuba	29,342
Barbados	22,099
Other British	325
Total	\$330,272

The export of barrel shooks for the same period is here given:

Country	Value
Barbados	\$104,097
Trinidad and Tobasco	31,967
Jamaica	29,106
Dutch West Indies	27,575
Other British	16,049
Santo Domingo	1,450
Haiti	774
Total	\$211,018

The value of box shooks for 1913 considerably exceeded the shooks for barrels. The exports are given below:

Country	Value
Cuba	\$296,342
Jamaica	28,947
Santo Domingo	7,421
Danish West Indies	1,599
Barbados	842
Dutch West Indies	597
Haiti	213
Total	\$335,961

FURNITURE

The people of the West Indies purchase much furniture from the United States, and also much from Europe. The total from this country exceeds in value a million dollars annually, as shown below:

Country	Value
Cuba	\$ 926,587
Santo Domingo	41,837
Jamaica	29,929
Trinidad and Tobasco	10,339
French West Indies	10,046
Dutch West Indies	3,519
Barbados	3,317
Danish West Indies	2,777
Oils	9,617
Total	\$1,037,968

MISCELLANEOUS

Large quantities of miscellaneous wood exports are shipped to the various islands of the West Indies from the United States. Some of the totals are shown in the following table:

Articles	Value
Agricultural implements	\$157,215
Empty barrels	59,941
Doors	33,255
Shingles	30,719
Incubators	14,752
Woodenware	9,411
All other wood manufactures	533,889
Total	\$839,182

PHYSICAL GEOGRAPHY

In few regions has physical geography greater influence on commerce than in the West Indies. In most respects these conditions are favorable but some are adverse. Ships can approach practically all of the hundreds of islands to load and unload merchandise, for which reason transportation is cheap. There are numerous commodious harbors where the largest ships may safely anchor.

During the season from July to October violent storms are liable to occur, which are frequently very destructive. They are known as "West Indian hurricanes." The origin of the name as well as of the storms is in that region. The Carib Indians who once lived there called this destructive storm "hurakan," and though we have changed the spelling the pronunciation remains the same. These storms are supposed to be caused in some way by the trade winds meeting the columns of heated air rising from the plains of South America. The hurricanes usually take a north or north-west course, and are not strangers to the coast of our southern states. The Carolinas are occasionally visited, and the partial destruction of Galveston is not forgotten.

The Gulf Stream is a remarkable phenomenon, which develops in the West Indies, under pressure of the trade winds which force vast volumes of water from the Atlantic ocean into the Caribbean sea and the Gulf of Mexico, whence it escapes northward in two enormous streams. The best known, but not the largest, of these streams passes through the Florida strait. It carries as much water as 300,000 Mississippi rivers. It is about fifty miles wide at the narrowest point and 2,700 feet deep. The water is warm. It is estimated to contain enough heat to keep constantly flowing a stream of molten iron as large as the Mississippi river. It is this heat that warms the British Isles and the northwestern countries of Europe.

FOUNDATIONS OF TRADE

The West Indies have a solid foundation for enormous trade. They have hundreds of millions of dollars' worth of products to sell yearly, and consequently are able to buy liberally. The United States is their most convenient and valuable market, and we can exchange our merchandise with them. Their products are extensive along certain lines, but are not greatly varied. Sugar, molasses, coffee, tobacco, and certain fruits constitute their farm products, which are wanted in this country. Many efforts have been made there during the past four hundred years to diversify the output of the farms; but nature seems to forbid. Horses become smaller with each generation; goats lose their vivacity and aggressiveness; the sheep's wool changes to hair; and even the determined effort once made to substitute camels for horses in Cuba failed because the camels were killed by jiggers which infested their feet.

The West Indian forests are everywhere deteriorating. Cut-over lands do not generally come on again with good timber, but with scrub and low plants. There are 3,350 flowering plants thus far listed in Cuba alone. A casual observer is apt to greatly overestimate the size of timber and its quantity. Take pine in Cuba and the Isle of Pines as an example. From a distance the stands resemble those of Louisiana, but on closer approach, the trees are found to be small and poor, often only twenty or thirty feet high, and fit only for fuel.

The island of Haiti, including the republics of Haiti and Santo Domingo, is popularly supposed to be richer in timber than any other part of the West Indies. That may be true; but an examination of books of travel describing that country, and reports on

economic statistics, give the impression that the timber resources of Haiti are greatly overestimated in popular opinion. The famous mahogany palace of Sans Souci, near Milot, nine miles from Cap Haitien, was built between 1807 and 1825 by King Henry Christophe. It is now in ruins. The quantity of mahogany in that structure has been reported as almost unbelievable; yet, when the palace has been subjected to plain measurements, it is found that the Continental and Commercial Bank building in Chicago contains more mahogany than the Sans Souci palace ever contained.

The Lesser Antilles, extending in a curve from Porto Rico to South America, are more famous on account of their volcanoes, among which are Mt. Pelee and Soufrier, than for their forests or agricultural resources. The largest island of the group is Trinidad, and others of importance are Guadeloupe, Dominica, Martinique, and Barbados.

Jamaica, which is a corruption of the original Indian name "xaymaca," meaning "land of streams," is a good market for American lumber, though it has numerous kinds of woods among its mountain ranges. This island belongs to Great Britain, and has an area of 4,207 square miles and a population of 807,000, ninety-eight per cent of whom are negroes.

Those who desire detailed information concerning the resources and conditions of the various parts of the West Indies will be well repaid by reading the following works: "The West Indies," by Amos Kidder Fisk; "Cuba and Porto Rico, with Other Islands," by Robert T. Hill; "Porto Rico: Its Conditions and Possibilities," by William Dinwiddie. The various consular reports relating to this region, listed in the first article of this series, will give valuable information concerning particular markets.

The Lowly Buckeye

Isn't it about time a champion appeared for the lowly buckeye? One by one the other woods of the country are being taken up and exploited, but the buckeye is well-nigh friendless. There isn't a great deal of it, to be sure, and no one knows how much is cut or used. A glance at the census returns for 1912 shows some 14 million board feet consumed, but the actual amount is considerably in excess of that figure.

The reason is not far to seek. There is no demand for buckeye but there is for the sapwood of yellow poplar or tulip-tree. The simplest way, then, of disposing of buckeye is to sell it as "poplar saps." The fact that one hears no complaint is in itself evidence that the wood's merits cannot be so very much below that of the better known species it counterfeits.

Buckeye is not without merit. The wood is of practically the same weight as basswood and yellow poplar, is soft, very fine and even of texture and of a uniformly light color. It is difficult to split, the fine fibers being interwoven and often curly. The medullary rays are extremely fine and the pores are minute, not visible to the naked eye.

It is evident that buckeye is a wood without figure, except what is occasionally produced in a particularly wavy piece. This feature, combined with its low clearability, adapts it to the manufacture of high-grade boxes. It can be printed on very readily, takes stain well and thus lends itself to imitations of Spanish cedar, etc. The principal use for buckeye boxes, however, is for candy, especially chocolates. It also goes into trunk boxes and sample cases. There appears to be no good reason why its use should be so limited in this direction. It should make an acceptable substitute for basswood in many instances.

Buckeye finds some place in general construction, being used more or less for casing, ceiling, cornice, door frames, partitions, sash, siding and window frames. It is not durable in contact with the ground or when exposed to the weather.

Buckeye finds some use in stack cooerage for heading, a place which so many kinds of wood can fill to advantage. It is also used

for veneer to some extent, especially for cores and for cross banding; also for veneer baskets. There ought to be a good demand for buckeye veneer in all sorts of ply work. Some buckeye is made into excelsior but the total thus employed is small.

There are three or four species of buckeye of tree size in the United States, but only two, the yellow buckeye and the Ohio buckeye, are of commercial importance. The woods are very similar in appearance and properties. The yellow buckeye is the most common, growing in mixture with other hardwoods on good soil. The states reporting the largest cut are Tennessee, West Virginia, North Carolina and Kentucky. It is not uncommon for lumbermen to pass it by in the woods, deeming it of too little value to bother with. In these days, when no wood is without its special merits, there should be little occasion to pass by as useless anything that is sound.

The states reporting the use of buckeye in their wood-using industries are:

Tennessee	2,840,000 feet B. M.
Kentucky	1,505,000 feet B. M.
Ohio	931,000 feet B. M.
Maryland	200,000 feet B. M.
Michigan	100,000 feet B. M.
Virginia	80,000 feet B. M.
New York	61,000 feet B. M.
North Carolina.....	10,000 feet B. M.

Buckeye is enough like cottonwood, basswood, tulip and willow to be adapted for many of the uses to which these woods are put, excepting where considerable strength is required. Such uses are: boxes and cases of all kinds, panels, drawer bottoms, clock cases, sugar and candy buckets, fish kits, spice kegs, honey sections and boxes, piano and organ keys, woodenware and novelties. It should also make good interior finish for enameling or painting. These are but a few of a hundred uses to which buckeye could be put to advantage. The fact that the wood is somewhat refractory in drying is no serious objection in these days of efficient drying apparatus and methods.

The Question of Veneer Presses

"If you were going to put in a panel department, what kind of press would you use?" was the question put to a group of men including a panel manufacturer, furniture manufacturer and a machinery man.

"A hydraulic or a hydrostatic press, of course," said the panel man.

"I would have a hydraulic and some hand presses, too," said the furniture manufacturer.

The machinery man looked as if he wanted to say something, started to, and then changed his mind and waited. By and by the inquirer turned to the machinery man and said:

"Well, come on, and tell us what you think about it."

"I think," said the machinery man, "that it depends a whole lot on what you intend to do and how you intend to do it."

"What has that to do with it?" inquired the panel man, "a press is a press, and where there is any quantity of gluing up to be done it is a waste of too much time and elbow grease to do it by hand, and when it comes to power presses I think the hydraulic press is the thing no matter what you want to do."

"Perhaps it is," the machinery man replied. "I know you get along with hydraulic presses and don't use any other kind, but just the same I recall that you let lots of work go by that you might do. I recall talking to you about special jobs in planing mill work and show window panels and you said you didn't want to bother with them because they call for special equipment and you wanted to reduce your equipment rather than add to it. Special panels of large size and of other shapes than flat call for the use of hand presses of various kinds, and if you had a room fitted up with hand presses you would find that there is lots of work, now passed by, you could take in and make something out of."

"Well," said the original inquirer, "can you tell me anything about what conditions of work or what circumstances make advisable the use of any one particular kind of press?"

"That is a pretty large order," said the machinery man, "but maybe I can give you some light on the subject of the press question."

"First you must take into consideration that there are three general divisions of presses used in the veneer business, the hand press in all its different forms, the power press driven with a belt on tight and loose pulleys or with clutches, which is simply a modification of the hand screw press with power applied. Then we have the hydraulic or hydrostatic press which uses a chamber and ram and the well-known principles of hydraulics to apply pressure. Usually with it the pressure comes from below, while in the belt driven power press the pressure comes from above and is downward on the press."

"As to selecting a press for different uses, several factors enter. One, of course, is the quantity of work to be done. Where the quantity is limited and the variety is wide hand presses naturally have the preference. They cost less and are easier to handle and can be spread out so as to take in more dimensions. For this reason planing millmen and practically all users of limited quantities of veneer stick pretty closely to the hand press in various forms. Others with somewhat larger quantities use both hand presses and the power driven presses which are simply a modification of the hand press with belt power attached. They can do a wide range of work with these and do it satisfactorily."

"Ordinarily one would argue that where there are large quantities of flat panels of practically uniform size to be made, the only proposition worth entertaining is that of using hydraulic presses. Yet in the face of all this, I know it to be a fact that a concern making enormous quantities of flat plain built-up work practically uniform in size uses nothing but hand presses. It has a perfect sea of these presses, an immense room like a big warehouse practically full of them with little runways between for putting in and taking out stock, and it keeps quite a crew of men busy screwing down and loosening up these presses."

"There, you might argue is a place where the hydraulic press or the power press should be doing the work, and it is a waste of time

and elbow grease to be doing it with hand presses. It suggests the idea that these people may be big factors but they are behind the times. That, however, is not the case, for these people are very progressive. The truth is another factor enters, one that perhaps you folks have not given consideration to. They use a glue mixture that will set in a very short time, say from an hour and a half to three hours. Instead of using hydraulic or other power presses for squeezing the stock together, and then clamping it up in forms and running it to one side till the glue sets, they simply provide an abundance of hand presses, screw the stock down in the presses and let it stand there until it sets. They provide enough of these presses so that before they are all filled the first ones are ready to open up. Hence it becomes a sort of continuous process of putting in stock on one side and taking it out on the other, and by the use of these presses in this way they eliminate entirely the work of clamping the stock up in forms and trucking it to one side to stand while the glue sets.

"So you see there are many factors which enter into this, and glue is one of them. Incidentally it should be mentioned that we are developing many new things in the glue line that cut some ice in the matter of presses. Some call for special hot presses, some for special shapes and forms that it is difficult to handle on any kind of a hydraulic or power proposition."

"Wherever there is work enough and it is practical to apply mechanical power it is generally advisable to do so. Whether that power should be hydraulic or applied to screw presses with a driving gear is a matter open to some debate."

"One of the strong points claimed for the hydraulic press is not merely that it is a powerful press and can be made to exert all the pressure required, but it is easy to attach a pressure gage to it so that the user may know positively just what pressure he is using. This is undoubtedly an important point, too, for positive knowledge of the amount of pressure used is a good thing."

"The makers of the screw power press, though, claim that the gage registry of a hydraulic press is not a register or a record of the pressure per square inch applied to the surface of stock in the press. It is not either, but it is practical to figure out from the pressure used the amount of pressure that is being applied per square inch of surface of the stock in the press. Even with this, though, there is some uncertainty. Leaving out entirely the matter of friction and the loss in transmission, there enters the question of thickness, of the amount of stuff that may be piled in a press at one time. Given material of the same dimension if one press full is built up of a thickness of six inches, while another has twice the quantity making up a thickness of twelve inches, there is certainly some difference. Just what difference or how the pressure distributes itself through varying thicknesses is a matter that it is a little difficult to determine satisfactorily."

"The question of pressure is one thing that we have very little definite information on. Every once in a while we hear of a piece of work being spoiled through excessive pressure causing a spreading of the core body or the mass of veneer and the opening of joints. Yet we find ourselves lacking in specific information when we undertake to investigate and analyze these. There is not enough positive record of pressure used; neither is there other definite information. Sometimes it may be the shape of the forms or cauls, and at other times it may be carelessness in matching and fitting up stock in the press that causes spreading, so we are left to guess at quite a lot of it."

"Some authorities claim that the only harm which can be done by extra pressure is the crushing of the wood—that until we get pressure enough to cause crushing of the wood there is no harm and no objection to high pressure. This point is probably open to debate. The writer has examined some veneer work that seemed to suffer from too much pressure. The pressure seems to have forced the glue out until the glue joint was starved and did not hold well. Moreover, some of the best glue work has been done with hand presses

and rather light pressure as compared to some of that used in hydraulic press work.

"So you see this question of what kind of presses to use is a complex one that is governed by many different factors. One thing, however, which is more important than the method of applying pressure in the modern presses, is the means provided for getting stuff into and out of the presses. If you are putting up work that must be clamped in forms and set aside while the glue hardens you will find that this putting in and taking out involves more time and work than that of putting on and taking off pressure, and in selecting presses this feature should be given serious attention. You can generally get the pressure on and off easier than you can get the material into and out of the presses. Study your material, what you

intend to make, how much and how long it will have to stand aside, and try to get a combination that will lighten the work of handling as much as practical. Then you will probably find, if you are doing a wide range of work, that you will have use for both power and hand presses. The matter of choice between belt drives and hydraulic will depend some on personal preference, some on the first cost, and some upon the quantity of work to be done. The power driven screw presses cost much less in the beginning and fill a sort of general middle ground between the hand press and the massive hydraulic.

"But after paying due respects to the belt driven power press and the more expensive ponderous hydraulic, don't forget that the little old hand press always has been and always will be a big factor in the veneer trade."

C. R. O.

Finish for Oak Floors

A flooring expert whose preferences are strongly on the side of oak, has compiled a table which, according to his ideas, shows the comparative beauty of floors of different materials. In this comparison marble is taken as the most beautiful floor, and is marked one hundred per cent in the scale. The other materials are rated in percentages as follows:

Oak	95
Cork tile	85
Tile, clay	85
Mosaic	85
Maple	80
Composition flooring	80
Terrazzo	80
Rubber tile	80
Linoleum	75
White pine	60
Portland cement concrete	45
Yellow pine	40
Slate	40
Face brick	40
Paving brick	30
Limestone	20

The appearance of nearly all floors depends on the finish, and this holds true of oak to as great extent as of any other. Architects recognize it. They know that the first impression when entering a house is generally produced by the appearance of the floor, because that is the first part seen. The finisher is instructed to put his best work on that part, and upon his success often depends much of the value of the house.

FINISHING OAK FLOORS

Personal taste and artistic or decorative effects are the guide for the floor finisher. The clear grade of oak flooring should have a natural oak filler, the color of oak. The select and sap clear grades want a light golden oak filler, and after the floor is filled it should be gone over with a little burnt umber mixed with turpentine to darken light streaks. This will make the select and sap clear grades look like the clear grade except slightly darker in color. In filling the No. 1 common grade, a dark golden oak filler should be employed, and the light streaks darkened in the same manner as the select and sap clear grades. If a little care is used in laying this grade, splendid results can be obtained.

Treat the floor with a paste filler of desired tone, to fill up the pores and crevices. To thin the filler for application, one has a choice of using turpentine, benzine, wood alcohol, or gasoline to get the right consistency. When the gloss has left the filler, rub off with excelsior or cloth, rubbing against the grain of the wood. This will make a perfectly smooth and level surface. It keeps out dirt and forms a good foundation, which is the key note of successful treatment of floors. Allow the filler twelve hours to set or dry before applying a wax or varnish finish. Never use a liquid filler on any floor.

THE WAX FINISH

A wax or varnish finish can be used. The wax finish is preferred by many, due to economy and ease of renewing places that show the

wear. The renewing can be easily applied by housekeeper or servant.

The best method for applying the wax is to take cheesecloth and double it to get a little more thickness; then make it into a sort of bag. Put a handful of wax inside of this and go over the floor thoroughly. You will find that you can work the wax through the meshes of the cheesecloth to give an even coating over the floor. This prevents too much wax in spots and wasting it. After the floor has been gone over with the wax and allowed to dry, say about twenty minutes, it is ready for polishing. Rub to a polish with a weighted floor brush, first across the grain of the wood, then with it. A clean, soft cloth can be used in place of the brush if desired. Then a piece of woolen felt or carpet should be placed under the brush to give the finishing gloss. After waiting an hour, a second coat of wax should be applied in the same way as the first and rubbed to a polish.

THE VARNISH FINISH

This is usually more expensive than the wax finish, but it gives a very hard surface, yet at the same time it is elastic. Two or three coats should be applied after the application of the paste filler. Each coat should be thoroughly rubbed with oil and pumice. Any of the standard hardwood flooring varnishes is recommended.

FLOOR OIL FINISH

When a high-class finish is not desired, a very economical one can be had by the use of a light flooring oil, that is made expressly for this purpose by many paint and varnish houses and oil makers. It serves as a filler as well as a finish and is strongly recommended for oak flooring in public institutions, office buildings and stores. This oil keeps the dust from rising and also preserves the floor.

Curing the Tardy Habit

Tardiness is a habit and like other habits it varies in the strength of the intensity and persistence among those who have it. Sometimes it is a habit very easy to break and at other times it is just about as easy to break an old toper from the whiskey habit. Time clocks have enabled manufacturers and millmen to put a check upon tardiness and to preserve a correct record, but even the time clock will not always cure tardiness.

This wouldn't matter so much were it not for the fact that often the tardiness of one or two men will hold up or seriously interfere with the operations of a plant. In the average sawmill, for example, it is important to have every man on the job at starting time and a good mill foreman will do one of two things—either he will cure the habit of tardiness or he will get rid of the man who persists in it.

The best general cure for tardiness is the presence of the mill foreman on the job before starting time every morning. With a foreman who is on the job regularly before starting time there will be little tardiness. There may be a few who will come late, even if they know the foreman is there to see them, but these few should be talked to seriously but kindly. Then if, after a fair effort of this kind, they can not shake off the habit there is only one thing to do, and that is, replace them with other men who can shake it off.

Compression Failures as Defects

By L. J. MARKWARDT, Assistant Engineer in Forest Products, Forest Products Laboratory, Madison, Wisconsin.

When too great a pressure is applied to struts or columns of wood in the direction of the grain, the fibers bend or buckle at the weakest point, resulting in a streak or wrinkle on the face of the material, which is an indication of a compression failure (see figure 1). The plane of compression failure usually makes an angle of about 60° with the grain. These injuries vary in size with the kind and condition of the material and of course increase with the magnitude and duration of the stress. While some failures are so pronounced as to be unmistakable, others are so minute that they can be detected only with great difficulty.

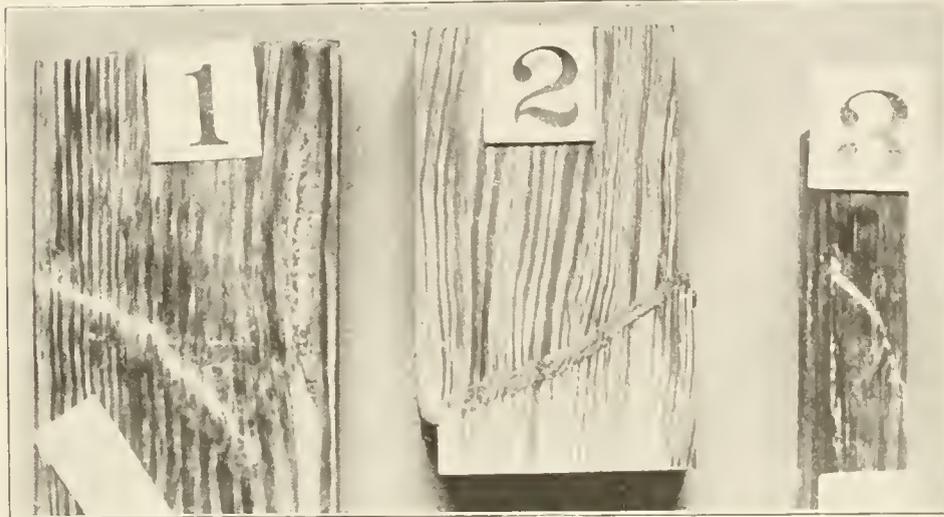

FIG. 1—YELLOW PINE. 1—PIECE OF FLOORING CONTAINING COMPRESSION FAILURE. 2 AND 3—COMPRESSION FAILURES FORMED BY TESTING MACHINE. NOTE SIMILARITY BETWEEN 1 AND 3.

When a beam is loaded the fibers in the upper half are in compression while those in the lower half are in tension. In consequence, failures similar to those found in props and columns are developed in the compression half of beams.

Compression injuries not readily apparent to the eye do not greatly impair the strength of wood when subjected to slowly applied loads, but the shock-resisting ability of wood of this character is seriously reduced, complete failure occurring very suddenly along the plane of injury.

Severe storms cause great stresses in trees, especially those which are in exposed positions. In this condition the windward side is in tension, while the leeward side is in compression. Since green wood subjected

to bending usually fails first in compression, there are probably many cases where compression injuries result without further damage to the tree.

An example of a failure of this type is shown in figure 2. The injury apparently caused an abnormally rapid growth about the region of failure. Such ridges or bumps may be produced by numerous other causes, and, therefore, are not always indicative of compression failures.

The ends of the specimen shown in figure 2 were originally sawed even. The wood about the failure was evidently confined in the tree in a stressed condition, and when given freedom expanded in the direction of the grain beyond the uninjured material farther out in the tree. The position of failures on the north side of this and other trees from the same locality indicates that the damage was due to a storm from the South. A count of the annual rings, together with a knowledge of the time the material was cut, shows that in all probability this storm occurred about 1898.

Extreme carelessness and rough handling of logs also produce compression failures. Such practices as felling trees across logs, dropping logs from a considerable height or unloading from a car across a single skid should be avoided wherever possible. Compression failures produced in the process of logging will, of course, be most prominent at the circumference of the log and will diminish

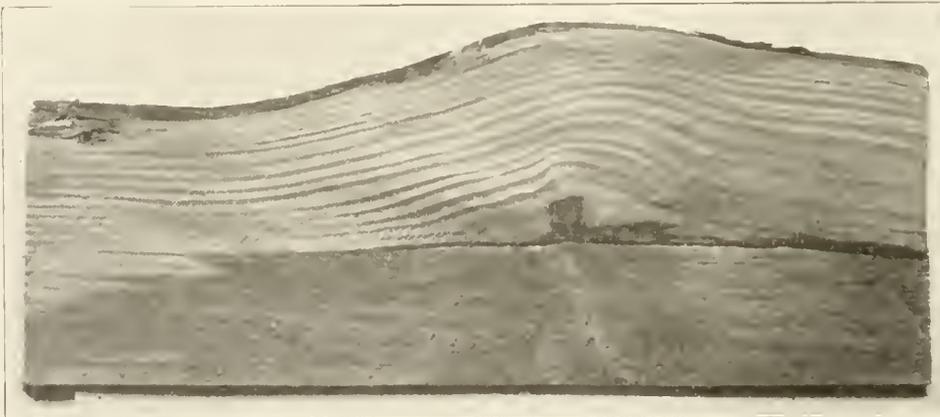

FIG. 2 EXAMPLE OF COMPRESSION FAILURE FORMED IN LIVING TREE.

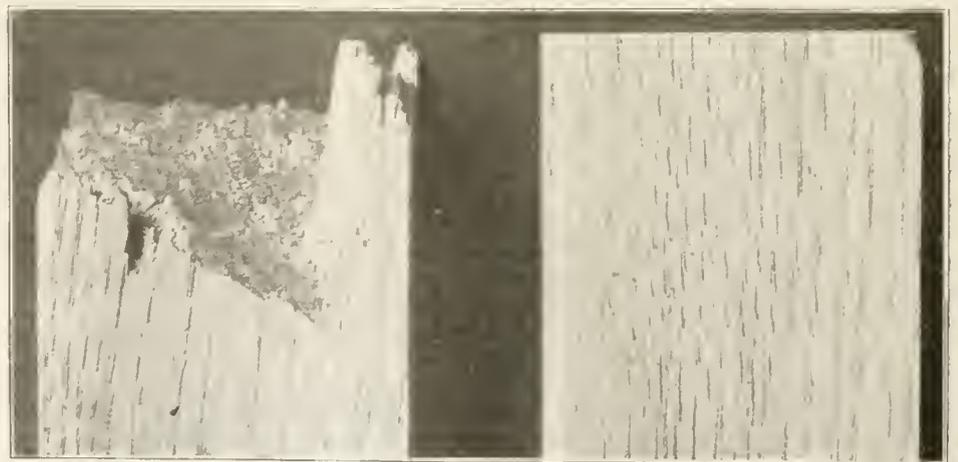

FIG. 4—CHESTNUT (*CASTANEA DENTATA*). THE SECTION AT THE LEFT SHOWS A TYPICAL FAILURE IN CROSS-BENDING AT PLANE OF PREVIOUS COMPRESSION FAILURE. THE ONE AT THE RIGHT IS A PIECE FROM WHICH PHOTOMICROGRAPH (FIG. 3) WAS MADE, SHOWING DIFFICULTY OCCASIONALLY EXPERIENCED IN DETECTING FAILURE. THIS PIECE WAS TWO INCHES IN WIDTH.

ish in magnitude toward the center or pith.

Figure 3 represents a photomicrograph of a compression failure which was evidently caused by improper handling. The injury is so slight, however, that in the specimen from which the enlargement was made (fig. 4—at right) no indication of the existence of compression failures would normally be observed by the unaided eye, and it was only through the sudden and otherwise typical failure in cross-bending (fig. 4—at left) that this case was discovered.

Compression failures in various degrees of magnitude have been found in material from the outer portion of logs from several other species. "Brittleness," sometimes reported as occurring in mahogany veneer, may be due to severe bruises inflicted in bringing the material to the mill.

In certain industries wood is subjected to conditions or treatment

FIG. 5. A—COMPRESSION FAILURE IN HICKORY BUGGY SPOKE. B TYPICAL BREAK OCCURRING AT COMPRESSION FAILURE.

ory spokes can be attributed either to this cause or to rough handling of the logs. Figure 5—a— shows a buggy spoke containing a compression failure and b one which has later broken along the plane of a similar injury.

While the occurrence of compression failures is probably not very common, a special effort should be made to eliminate all material of this character where shock-resisting ability is of importance. A knowledge of these failures and their causes may prove of value in reducing the number of such injuries and in detecting injuries in places where they would be most serious.

which may result in compression failures during manufacture. In driving buggy spokes, for instance, the impact of the blows delivered after the spokes have reached a bearing is occasionally great enough to injure the material. Most failures found in hick-

The Lead Pencil Supply

Lead pencils are not coming from Germany and Austria now, and before long somebody will be trying to corner the article and raise the price. It has been found pretty difficult to obtain statistics on the lead pencil business, both domestic and foreign. The makers of pencils of paper instead of wood have persistently refused to tell their output. It is believed, however, that they do not cut any great figure in the pencil business. The total number of wooden pencils made or used in this country is not definitely known.

The wood used is principally red cedar from the southern states, but some incense cedar is beginning to reach market from California, while a number of other woods, including white pine and basswood, are employed in making cheap pencils. Some of the cedar is worked into finished pencils in this country, other is sent to Germany and Austria for manufacture. The foreign business is suspended. The wood can not go from America to those countries, nor can the finished pencils come back. European pencil makers have been drawing supplies of African cedar from the eastern equatorial regions of that country; but no wood from that quarter can now reach the Austrian and German pencil makers. They have no home woods that are suitable. The far-seeing Germans and Austrians took steps years ago to provide a home supply by planting large quantities of southern red cedar

FIG. 3. PHOTOMICROGRAPH OF COMPRESSION FAILURE FOUND IN PIECE TAKEN FROM OUTER PART OF CHESTNUT LOG. FAILURE CAUSED BY ROUGH HANDLING. (SEE ARTICLE ON OPPOSITE PAGE.)

seed from Tennessee. The trees have grown at a satisfactory rate, but the wood has proved to be a keen disappointment to the pencil makers. It is not soft and brittle like the cedar of the South, but contains hard streaks and is tough. It is not available for pencils, except those of the cheap sorts, such as are made in the United States of pine and basswood. Red cedar and hickory are two valuable American woods which have not done well when planted in Europe.

There is no danger of a pencil famine in the United States on account of the cutting off of the foreign supply. There are some first rate pencil makers in this country. Supplies of certain familiar brands may fail, but no person need do without good pencils on account of the trouble on the other side of the sea.

Some of the best graphite mines are in foreign countries, and that supply will be interfered with. Graphite as well as wood is required in making lead pencils. Formerly graphite was obtained wholly by mining the mineral, which was originally a vein of coal, but has been pressed and heated during long geological periods of time. But native graphite has lost some of its importance since the discovery that a substitute can be made by passing electric currents through anthracite coal. Large quantities of this material are manufactured at Niagara Falls. Some of the best native graphite mines are in Austria.

The Lumbermen's Round Table

The Market Value of Lumber

A hardwood man who had a lot of plain oak on his yard recently said that he was holding it for a certain price, naming a figure which was several dollars above the market at that time.

"Surely you don't expect to be able to sell your lumber at a premium of over ten per cent," a friend suggested. "If you are going to do business, you must do it at the prevailing prices."

"It cost me so much to make it," the manufacturer replied, "that I can't afford to sell it for any less."

"Yes," returned his friend, "but would it cost you that much to replace it?"

And the lumberman had to admit that it wouldn't.

This raises a rather interesting question as to market values. In the first place, the distinction between market values and intrinsic values should be closely drawn. Of course, the market value ought to represent intrinsic value: that is, one should always be able to sell his product at a price that represents cost of material and labor, plus overhead, plus a profit. But it sometimes happens that this can not be done. Is the attitude of the man quoted above, who refused to sell unless he could get a price in line with intrinsic value, logical, or was he vainly endeavoring to maintain an artificial level of prices?

The cost of replacement seems to be the logical method of determining whether a given price is too low. If the lumberman can go out and buy the stock at a figure low enough to enable him to turn it over at a profit, the price would seem to be in line. In fact, some lumbermen accept business of that kind, and handle it without touching the higher-priced stock in their own yard, apparently appeasing their business consciences without losing the trade. It amounts to the same thing, however, and one would be justified in shipping out lumber that cost less than the selling price, provided it were possible to replace it at a sufficiently low price.

There is an interesting analogy in the leather manufacturing industry. The parallel is well drawn because there, as in lumber manufacturing, it takes several months to convert the raw material into the finished product. The tanner often buys high-priced hides, and six months later, when he goes to sell the leather, finds that the price of hides has dropped. He is forced to sell the leather at a lower price, but makes up for it frequently when he puts in low-priced hides and takes out leather that has become high-priced by the advancing hide market.

This happens in the case of lumber. The market changes while the stock is on sticks, and the lumberman must take the bitter with the sweet, selling at the low price and taking the loss if the market has gone against him, and taking advantage of the "unearned increment" of higher prices if it has moved the other way. There is no way to avoid this: the change is a condition and not a theory, and it is up to the lumberman to make the best of it.

The hardwood man, however, is sure to come out on top if he follows this plan constantly, because the general movement of values is upward.

The Value of a Veneer Stock

Veneer manufacturers have often questioned the wisdom of carrying big stocks, and have held that the business could be carried on to the greatest advantage by cutting up the logs and flitches just as the stock is needed. That may be true, as a general proposition; yet a certain large concern in the mahogany business, which has several hundred thousand feet of veneers on hand, finds itself in a particularly enviable position at present, by reason of having a well assorted stock of selected veneers, which can hardly be duplicated elsewhere, in view of the prevailing shortage of mahogany logs. There may be no moral in this, however; the concern may simply be lucky enough to have hit the situation right. You don't have a war like this every year, of course.

Why Not Get Together?

Lumbermen's clubs are numerous, both in the manufacturing and consuming districts; and in recent years the furniture manu-

facturers and other users of hardwoods have been seeing the benefits of getting together occasionally and exchanging ideas. The lumber club has a solid foundation in the practical benefits growing out of the trading which can naturally be indulged in, while the consumer's advantages are less direct, though they are there, just the same.

Now, while everybody realizes that it pays the members of each trade to join hands, it is seldom that anybody suggests that the lumbermen and the consumers meet each other. Yet there is no reason to doubt that this would help to clear up a great many questions that are constantly uppermost, and remove the doubts and fears of consumers on a considerable number of important topics. The consumer often thinks that the lumberman is a robber, and the lumberman reciprocates by occasionally referring to his friend, the consumer, as a thief. The terms are usually not deserved on either side, and grow out of the lack of understanding.

The lumberman needs the consumer, because he has to have orders to exist; and the consumer simply couldn't run his factory without the assistance of the lumberman. An occasional talking over of the troubles that are experienced at each end of the transaction would help to straighten them out, and would reduce the friction of carrying on the business for everybody.

The Value of Hardwood Flooring

That hardwood flooring not only adds to the value of a residence from the standpoint of intrinsic quality, but adds materially to its salability, is a fact with which members of the flooring trade are familiar. The public, however, is likely to overlook this fact unless it is brought to its attention in an effective way. Those who are building houses to sell often use less hardwood flooring than they should do, considering the great "talking-point" which is developed in this way.

There came to our notice recently the case of a \$7,500 residence, the sale of which was almost spoiled because the builder had put hardwood floors in the dining-room and living-room only, and had failed to include this material in the five other rooms of the house. A prospect who liked the building flatly refused to consider it unless the remaining rooms were finished with hardwood floors, and this was finally done. It would have been much better to have put in these floors in the first place, as there is no telling how many people looked at the house and said, "Oh, no hardwood floors," and passed on.

The average person probably has an exaggerated idea of the cost of hardwood flooring. An average cost is probably eighteen cents a square foot. The ordinary room is not more than fifteen feet square, or two hundred and twenty-five square feet. That would make a cost of \$30.50 for the room. In a six-room house, including all halls, the cost would be well under \$200; and it is safe to say that a house so treated would be worth fully \$500 more, from a real estate point of view, than one without floors of this kind.

On the other hand, hardwood floors are desirable from the standpoint of cleanliness and sanitation as well as because they add to the looks of a home and are considered "swell." Floors that are cleaned often—constantly compared with those covered with carpets—certainly do not harbor germs; and the housewife who can run an oiled mop over the surface of her floors and clean them thoroughly knows that the labor of taking care of them, compared with cheaper floors, is trifling.

The hardwood floor manufacturers and contractors ought to emphasize these points, instead of merely competing for the business already in the market. One result would probably be business from people who are not now being solicited, and who would want to improve their homes by putting in hardwood floors.

An Indiana firm is reported to have received an order for five cars of walnut and oak lumber for immediate shipment to London, England.

Effect of Locality on Growth

Much difference of opinion exists as to the effect of the locality upon the quality of the wood grown there. Some manufacturers claim that southern grown hardwoods are not so strong as the northern grown and object to the use of the wood in exacting positions. Others claim that woods produced in the South are not so hard and do not wear so well as those grown in the North. A manufacturer of shuttles not long ago was inquiring about the supply of dogwood and persimmon in Arkansas, but stated that he feared it would not be hard enough for his use even if found in sufficient quantities.

About twenty-five years ago a representative committee of the Carriage Builders' Association publicly declared that this important industry could not depend upon the supplies of southern timber as the oak grown in the South lacked the necessary qualities demanded in carriage construction. This statement reached the ear of Dr. Fernow, chief of the Division of Forestry at that time, and he had some experiments made to refute the charge, which he characterized as "little better than a guess, and doubly unwarranted since it condemned an enormous amount of material, and one produced under a great variety of conditions and by at least a dozen species of trees, involving, therefore, a complexity of problems difficult enough for the careful investigator, and entirely beyond the few unsystematic observations of the members of the committee on a flying trip through one of the greatest timber regions of the world."

A number of samples were at once collected (part of them supplied by the Carriage Builders' committee) and the fallacy of the broad statement mentioned was fully demonstrated by a short series of tests and a more extensive study into structure and weight of these materials. From these tests it appeared that pieces of white oak from Arkansas excelled well-selected pieces from Connecticut both in stiffness and endwise compression, the two most important forms of resistance.

One of the moot questions among hickory men even now is in reference to the relative value of northern and southern hickory. The impression seems to prevail that southern hickory is more porous and brittle than the wood from the North. The Forest Service made a lot of tests on selected woods from different parts of the country and these indicated that southern hickory is as tough and strong as northern hickory of the same age. But the southern hickory has a greater tendency to be shaky and this results in much waste. The difference is not due to geographic location but to the character of the timber being cut. Nearly all of that from southern river bottoms and from the Cumberland mountains is from large, old-growth trees while that from the North is from younger trees grown under more favorable conditions. It is due simply to the greater age of the southern trees that hickory from that region is lighter and more brash than from the North.

That in wood of similar character the advantage is not always to the northern grown hickory is shown by the figures of strength. Big shellbark from Ohio had a modulus of rupture of 9,880 pounds per square inch while Mississippi shellbark had a modulus of rupture of 11,110 pounds. Pignut hickory from the South was of the same strength as that of the North. Shagbark hickory from Mississippi was followed closely by the West Virginia product, and both of them were better in strength and toughness than similar material from Ohio and Pennsylvania.

Experiments on oak show interesting results. Red oak from Arkansas exceeded red oak from Indiana but was itself distanced in some respects by a Louisiana product. White oak from Arkansas and Louisiana were about a tie but were excelled by the Indiana material. Yellow oak from Wisconsin appears to be weaker than that from Arkansas. These figures of course must not be taken as conclusively demonstrating the superiority of the wood of one region over that of another for wood is subject to such individual variations that as much difference may be found in two trees on the same tract as between those grown a thousand miles apart. They do indicate very strongly that there is no sound basis for discrimination

against southern hardwoods merely because they are grown in the South.

When one stops to think of the hardest woods of all grow in the South. *Lignum-vitae*, quebracho (ax-breaker), black ironwood, and a formidable list of others are tropical or sub-tropical. In fact one often thinks of the tropical countries as producing only hardwoods since these are the ones commonly found on the market for cabinet purposes. Yet such is not the case, for the lightest woods in the world grow there also. The lightest wood in the United States is the corkwood found in Florida and the lower Mississippi valley. Balsa wood of the West Indies and South America is the lightest wood in the world, being lighter than true cork. On the other hand, live oak, famous for ship-building, one of the most exacting uses to which wood could be subjected, is a southern wood. All of which merely goes to prove that generalizations regarding the effect of geographic location of the quality of wood are very subject to error.

A point of greater importance is the effect of the immediate locality on the quality of the timber grown there. While it might appear that the best timber would be grown on the best soil, such is not always the case. In some regions there are many small, stunted hickories which users will not touch. They have narrow sap, are likely to be bird-pecked and show very slow growth. Yet five of these trees from a steep dry slope in West Virginia had an average strength fully equal to that of the pignut from the better situation, and were superior in toughness. The trees had twice as many rings per inch (grew twice as slowly) as others from the better situations. This, however, is not very significant, as trees of the same species, age and size, growing side by side under the same conditions of soil and situation, show great variation in their technical value. It is hard to account for this difference but it seems that trees growing in wet or moist situations are rather inferior to those grown on fresher soil. It is claimed too that ash grown in the lowlands is inferior to that produced on the upland.

From experiments on conifers the old Division of Forestry of the United States Department of Agriculture came to the following conclusions: "In both the Cuban and the longleaf pine the locality of growth appears to have but little influence on weight and strength, and there is no reason to believe that the longleaf pine from one state is better than that from any other, since such variations as are claimed can be found on any 40-acre lot of timber in any state. But with loblolly and still more with shortleaf this seems not to be the case. Being widely distributed over many localities different in soil and climate, the growth of the shortleaf pine seems materially influenced by location. The wood from the southern coast and gulf region and even Arkansas is generally heavier than the wood from localities farther north. Very light and very fine-grained is seldom met with in the southern limit of the range, while it is almost the rule in Missouri, where forms resembling the Norway pine are by no means rare. The loblolly, occupying both wet and dry soils, varies accordingly.

"It is clear that all localities have their heavy and their light timber so they all share in strong and weak, hard and soft material, and the difference in quality of material is evidently far more a matter of individual variation than of soil or climate." S. J. R.

The boosters of iron and concrete in building construction as a safety over destruction by fire have yet to demonstrate its absolute superiority over heavy timber in this capacity. A striking illustration of the inability of iron and concrete buildings to withstand severe fires is found in the result of the fire which destroyed the large new Philadelphia & Reading railroad pier at Catherine street wharf, Philadelphia, on October 14. The pier was of the most modern concrete and iron construction type, and although not entirely completed was in use and fairly well stocked with freight. The fire was a fierce one and the large iron girders, unable to withstand the excessive heat, evidently caused the whole structure to collapse. The loss is estimated at from \$200,000 to \$250,000.

Pertinent Legal Findings

Personal Names as Trade-Mark

Although a manufacturer or dealer can not acquire a valid trade-mark consisting of his family name, so as to preclude any other person of the same name from using it in the same line of business, the law will protect exclusive use of such a name where it has been so long used to denote a certain concern's product that a fraud would be perpetrated upon the public by permitting a competitor to adopt the same name, thus creating confusion in the minds of purchasers as to the origin of particular goods. In such a case, the courts will require the newcomer in the field to so qualify use of the personal name as to avoid such confusion. This relief is not granted on the theory of infringement of a trade-mark, but on the ground of unfair competition. (United States Circuit Court of Appeals, Seventh Circuit; Chickering vs. Chickering & Sons; 215 Federal Reporter 490.)

Valid Regulation of Payment of Wages

The United States supreme court lately sustained the validity of the law in force in Virginia which prohibits a manufacturer from issuing orders to employes in payment of wages unless the same are redeemable in cash. (Keokee Consolidated Coal & Coke Company vs. Taylor, 34 Supreme Court Reporter 856.)

Validity of Oral Agreements

The law commonly known as the Statute of Frauds, which declares that an agreement not to be performed within a year shall not be enforceable unless evidenced in a writing signed by the person to be bound thereby, does not invalidate a contract for the cutting of timber from a tract of land, no time for completion of the work being named, if the work may be completed within one year, although the contractor may have contemplated a longer time when the agreement was entered into. (McClanahan vs. Otto-Marnet Coal & Mining Company, 82 Southeastern Reporter 752.)

Rights of Shippers of Lumber

Plaintiff shipped quantities of dressed and rough lumber from Savannah to New York by vessel, part of which was delivered, the remainder being held by the steamship company under a claimed lien to cover the excess of the freight charges, as claimed by it, above the amount which plaintiff admitted to be due. Plaintiff thereupon bought lumber in the open market to make up the quantity withheld by the steamship company and sued for the value thereof. In affirming judgment in plaintiff's favor, the United States circuit court of appeals, in the case of Vanderbilt vs. Ocean Steamship Company, 215 Federal Reporter 886, decided that plaintiff was entitled to the benefit of a general custom prevailing in the lumber trade to allow shippers a ten per cent deduction for wastage resulting from the dressing of rough lumber. It was therefore held that the steamship company, in refusing to allow this deduction, and in withholding delivery, after proper charges were tendered, became guilty of a conversion of the lumber, and that plaintiff was thereupon entitled to do what he did—purchase lumber in the open market to cover that withheld, and hold the company for the cost thereof. The court said: "The act of a carrier in failing to deliver without lawful excuse goods intrusted to his care constitutes both a breach of contract and also a conversion; and where property has been wrongfully converted to the use of another, the measure of damages has been usually held to be the value of the property at the time of the conversion together with interest from the date of the detention."

Recognizing the general rule of law that the terms of a written contract cannot be contradicted by a party to such contract, the court said in this case that so far as a bill of lading evidences definite terms it cannot be varied by oral testimony showing an agreement to the contrary. But the opinion states that the recital as to the quantity of freight received under the bill of lading is not conclusive upon either party. That is, the carrier can show that it did not actually receive the quantity stated in the bill, or the shipper can show that more was received than recited. Thus it was decided that a bill of lading covering lumber may be contradicted as to the quantity received for transportation, although the receipt

specified that the shipment was "said to contain 26,304 superficial feet, more or less," especially since there were other recitals to the effect that the weight was unknown and was "subject to correction."

Claims Against Bankrupt Concerns

When a lumber column manufacturing company became bankrupt it had on hands a number of columns which had been made for plaintiff for a third party in payment for lumber delivered by plaintiff to the third party, and in turn delivered to the bankrupt company. Held, that since at the time the company became bankrupt there was nothing to show that title to the columns had passed out of the company, plaintiff was not entitled to claim them in the hands of the trustee in bankruptcy. (United States District Court, District of Connecticut; In re Colonial Mill & Lumber Company; 215 Federal Reporter 640.)

Advertising Competing Products

After a patent expired on a revolving door, a new manufacturer of the same kind of a door became entitled to use in its advertisements a cross-section illustration of the door, although the same illustration was previously used by the patentee, in the absence of any showing that any distinctive features not descriptive of the door was imitated. Nor is the new manufacturer guilty of unfair competition in adopting the phrase "always closed" previously used in the patentee's advertisements, since that is merely descriptive of all doors of that type. (United States Circuit Court of Appeals, Seventh Circuit; Van Kannel Revolving Door Company vs. American Revolving Door Company; 215 Federal Reporter 582.)

"Pom" Immortalized

Just what constitutes the great immortalization—the appearance of one's name in our widely read columns or the receipt of a personal cablegram from the Kaiser of all Germany—is difficult to determine. Perhaps there is room for more or less prejudice on our part, as we are rather inclined to believe that greater distinction can come from the former than from the latter favor.

However, in order to be entirely impartial, we are presenting the fac-simile cut (see opposite page) illustrating a recent cablegram received by L. J. Pomeroy direct from his imperial majesty, thus enabling "Pom's" friends to have a fair chance of making their own estimates as to the relative importance of these achievements.

"Pom" was rather inclined to be in doubt himself and hence turned over this cable to HARDWOOD RECORD in order that there might be no possibility of his being denied either glory. Having the cablegram and having long had his eyes on the coveted news pages, he seized this opportunity of getting himself in print, and HARDWOOD RECORD is quite willing to humor him to the extent of announcing his distinction in this manner.

Retailers Getting Busy

Manufacturers who are adding American black walnut to their lines have been greatly interested to note the way in which retailers are taking hold of the proposition. The furniture dealers all over the country are appreciating the strong selling points connected with black walnut, which has sentimental associations and a splendid history back of it, while the character and quality of the wood, and the rich and elegant appearance of furniture and other goods which are made of it make it popular even with those who have not been cherishing beautiful pieces of furniture handed down by earlier generations.

"The effect of the advertising of the retailers," said a well-known walnut man recently, "will undoubtedly be stimulating, as the general public will be brought closely in contact with the proposition, and the mouth-to-mouth advertising which walnut will get as the result of the sale of furniture at retail and the work which the furniture merchants do in the newspapers and on their own floors, will make it much easier from now on to keep walnut moving. It is already apparent that a record-breaking number of manufacturers of furniture will include walnut in their lines at the January shows."

From the German Viewpoint

Editor's Note

The communication which follows was sent to **HARDWOOD RECORD** on October 1, by the firm of M. & H. Wuesthoff, lumber and log importers, Duesseldorf, Germany. It gives the German view of the causes of the present unfortunate war, and its progress up to the date of the letter. In addition to those matters, it contains information concerning the business conditions in Germany which will be read with much interest by lumbermen and other business men in this country:

Duesseldorf, Germany, Oct. 1.—As told in the German Whitebook it has been proven already that the war was brought about by the mobilization of the Russian army on the German frontier. Only after Russia declined to stop this proceeding, the order for the mobilization of the German armies was issued. At the same time war was declared with France and Russia. As our diplomats knew that Belgium had a secret treaty with France and England to join those powers in an eventual war with Germany, a part of the German armies was ordered to invade France from the north side by the way of Belgium. This was done only after an ultimatum had been sent to the Belgium government. Later on during the war it turned out, that French and even English troops had joined the Belgian forces two to three weeks before the war was declared, thus showing that the allies were fully determined to overpower Germany by surprising it in the midst of peace. The documents of proof regarding this matter will be made public in due time. Only on account of their thoroughly worked-out organization, the German armies were ready much sooner than those of the allies and therefore were in condition to take the offensive.

Already in the first three weeks after the beginning of the war it was shown that the German artillery was far superior and that no fortress ever so strong could withstand the bombardment of the new heavy 16½" siege guns. While the German forces in the southern Alsace confined themselves to protecting the borders, the other German forces marched through Belgium and northern France, defeating the allied troops everywhere, occupying entire Belgium with the exception of Antwerp and Ostend and marching close to Paris. At the present moment a decisive battle is raging between Verdun, Reims and Paris, and according to the latest reports the allies have been compelled into a defensive position and the German forces have every possibility to win this battle.

Since September 24 the bombardment of Antwerp has begun, and there is no doubt whatever that we can expect its surrender any day, especially since this city is overcrowded with fugitives who are apt to cause trouble. Entire Belgium is now under German administration. The destruction of Louvain was simply caused by noncombatants trying to shoot the Germans from hiding places. The Belgian citizens have in the whole caused the war to become very cruel because they tried to kill the Germans, even the wounded, wherever they could. The French people, however, have known that the Ger-

mans do not hurt anybody who keeps within the restriction of the law and, therefore, hardly any trouble has been encountered on the French soil.

The last days, a big uproar has been created by shooting and partly destroying of the cathedral at Reims. The German general staff issues now a statement to the effect that the French mounted machine guns on the top of the cathedral and also placed part of their artillery behind this building. For this reason the German artillery was compelled to bombard the cathedral, but as is shown now, the principal and most valuable part of it is still unharmed.

In the East the German army evacuated a part of East Prussia, thus causing the Russians to invade this territory. This was done

for good reasons as it was the object of the general staff to squeeze in the Russians between the Nasurian swamps. The result is known now. At Tannenberg the Russians lost over 100,000 prisoners, and more than 150,000 Russians were killed, or drowned in the swamps. Another part of the Russian army a few days later was fully defeated near Lyck and lost more than 30,000 prisoners and about 20,000 dead and wounded. Altogether the Germans have now made 400,000 prisoners and have taken more than 2,000 field guns.

A few days ago, one German submarine succeeded in sinking three English cruisers with a total tonnage of 37,000 tons. Up till today the Germans have destroyed approximately 80,000 tons of the English war fleet, besides sinking a large number of English merchant ships. When the time comes the German armies will invade England and after the stupendous success which has been with the German armies up to now there is no doubt that England will get her penalty for trying to betray us.

Now to the economical situation: From the Americans who in the meantime have returned from Germany to your country, you will have heard that the war caused no internal disturbances in Germany whatever. On the contrary there was never more order and safety. All different political parties, including the socialist democrats joined hands and all parties voted unanimously for the big war loan of 5,000 million marks. The first 1,000 million were issued the other day, but on this part of the loan more than 4,500 million marks were subscribed for. This shows that the German finances were in an excellent state. All our banks have plenty of money. There have been no failures whatever, and the course of the German state bonds has risen considerably since the beginning of the war. Many

LATEST NEWS FROM THE FRONT

Landeck Lumber Company,
Chicago, Ill.

The GERMANS have taken PILSENER and are now surrounding DELICATESSEN where the WURST is expected. The BELGIAN HARES have had a falling out with the WELSH RABBITS and the SWISS CHEESE is shot full of holes. This will make the IRISH STEW and the ENGLISH MUSTARD hot, and if the RUSSIAN CAVIARES and FRENCH PASTRY it may start a SWISS MOVEMENT. The SPANISH ONIONS are strong for a mix-up and if the ROME PRESERVES are called out and spread over the GERMAN NOODLES, they may KETCHUP with the NAVY BEANS, thereby causing an uprising of the BRUSSELS SPROUTS.

William

of our socialist leaders have entered the army as volunteers, and you might have heard of the deplorable death of the most famous Dr. Frank on the battlefield. All socialists have proven that they stand in full force behind the emperor who is now loved more by his people than ever before, because he has shown that he wanted peace, but was compelled to enter the war. It will be proven that all our adversaries have conspired against Germany more than ten years.

Nature itself is with us, as there never before has been such a splendid crop, and we now have food stuff products here in our country to last us more than eighteen months without being compelled to import a single bushel. Also, our cattle are in fine shape and we get plenty of other products from Holland and other neutral states. The prices of meat have gone down from ten to thirty per cent since the beginning of the war, also the prices on eggs and butter which clearly shows that there are ample supplies. Our big factories and steel works are all running although with diminished forces. We have now fast trains running through the entire empire on their regular schedule. There is no sign of the war within the boundaries of Germany now, with the exception of the wounded soldiers who pass through enroute to the hospitals, and the large number of prisoners who are now employed cultivating the soil.

We do not need to import ammunition; on the contrary we can supply the whole world with this product. In fact, our factories have supplied previously our adversaries with a great number of

guns, rifles, etc. It is the general opinion that Germany can stand this situation longer than any of her adversaries, as we have now occupied large foreign territories viz: entire Belgium, northern part of France and part of the Baltic provinces of Russia. This gives us all the supply of lumber, corn, etc., we possibly might want. The German industry is not dependent so much on the export business, while on the other hand the outer world is much interested in our products, for instance, the chemical products, dyes, etc. Many industries in the United States, England, Italy, etc., have come to a standstill on account of their not being able to get the chemical products from Germany. Both France and England are now in a very bad financial state. France has tried in vain to place a loan in America and England, while Germany has shown itself able to obtain all the money it needs within its own boundaries. In spite of the war loan etc., money can be borrowed here at the rate of three and one-half to four per cent.

We might add that the Austrians have succeeded in crushing Serbia, while near Lemberg, on the Russian frontier, the Russians have been beaten twice. One part of the Austrian army had to fight against a far superior force and there the battle has come to a standstill. This army is reinforced now. Altogether we all know that we must win and therefore we will win, and all reports saying that the general opinion is not bent upon this purpose and that we have weakened are utterly false.

Why Smith Stays on the Road

For some time there has been a suspicion, which has been crystallized in occasional complaints, that too many lumber salesmen are on the road. Now it is the buyer who complains, because too much of his valuable time is taken up by the knights of the grip; and then the manufacturer or wholesaler, looking over the expense accounts of his salesmen, and figuring selling costs on a footage basis, begins to scratch his bald spot and wonder whether, after all, it pays to contribute so largely to the revenues of the railroads and the hotels of the country.

There are some concerns, especially in the hardwood business, which have no selling organizations to speak of. Most of their production is disposed of by mail, and they are among those who believe that salesmen are "lingering superfluous" on the business stage, and could be dispensed with just as well as not, if everybody had a mind to take this step. And yet the salesman is still here.

As a matter of fact, the lumber salesman is a good deal like the retail yard man: he represents an expense, but it is an expense that can't be avoided. The hardwood people who try to sell all their lumber to the factories direct, without the interposition of salesmen, come to the end of their rope in a good many cases, just as do those who try to run a mail order lumber business which doesn't take the yard man in the retail centers into account. There has got to be a middleman—in the case of factory business the salesman, and in the case of building stock, the retailer.

The necessity of having salesmen to look after the business of consuming manufacturers is being effectively demonstrated just at present, when there is a lull in business caused by the new conditions brought into being by the European war. The houses with salesmen on the road are getting some business; not as much as usual, to be sure, but still some; while those who have no road men are on starvation rations, and are finding that the mail is very slim and scanty, and that orders are as scarce as the proverbial hen's teeth.

All of which goes to show that the salesman can do things which can't be accomplished in any other way.

Take the typical case of the furniture manufacturer who is wondering whether he is going to be able to move the finished goods he has piled up in his warehouse, and whether the retailers are going to cancel the orders they gave him before the war broke out. His frame of mind is unfavorable to anybody who has goods to sell. He is uncertain, moody, uncomfortable mentally and perhaps physically,

because, when one feels out of joint with the world, digestion fails to wait on appetite. The mental outlook has a good deal to do with the flow of the gastric juices, and the man who is not on good terms with his stomach is a hard nut for the salesman to crack.

Assume that this consumer gets a letter or two or three from hardwood concerns, all wanting to sell him the best lumber in the country at the lowest prices ever quoted on such unusually high-grade stock. Of course, he sits down and starts a letter to each of them, stating briefly, but succinctly, "You may ship me at once," etc. Yes, he does, *not*. As a matter of fact, the chances are that the letters go into the waste-basket, along with the circular from the bond house which he used to patronize occasionally, and the form letter from the glue concern which has a new blend to offer at three cents a pound less than it is worth. He is simply on the bear side of the market—and he is likely to stay there until somebody turns the war clouds inside out and shows him that they possess, really and truly, silver linings.

But just then there is a cheerful voice in the outer office, and the bookkeeper pokes his head in and says, "Mr. Smith of the Bungtown Lumber Company wants to see you."

Now Smith is an old friend. He has been dropping around and selling ears of the Bungtown company's hardwood lumber for a good many years, and the kicks have been no more numerous or severe on his lumber than on that coming from elsewhere, so, other things being equal, the furniture man would just as soon give Smith an order as the next man. Now, of course, he would no more buy hardwood lumber than he would fly; but there is no reason why he shouldn't pass the time of day with Smith.

In comes Smith.

There is a smile on his face, and the smoke from a panatela is wreathing his head like an aureole. As they shake hands and he sits down, his hand mechanically goes to his upper left hand vest pocket, and another panatela comes forth, which the lumber buyer as mechanically takes, dehornes and lights. (All this goes into the expense account, and thence into the overhead expense charge; but why should the buyer worry? Answer: he doesn't.)

Smith doesn't immediately get out his order book and ask his friend the furniture man to present him with his autograph; which, by the way, is the action which has been required of him by the sales letters which have just been dumped by the office boy. He is too

good a salesman for that; and, by looking at his man he can tell without asking that he is feeling blue and is not going to admit that he needs any lumber.

"Just came from Springfield, where I saw the Wolf Furniture Company," he begins. "They are certainly doing business over there. They've put on some new lines this year that are taking mighty well, and they are beginning to feel that Kaiser Bill can't put a crimp in their trade this fall."

"Uh-huh," replies the furniture man, refusing to bite, though the Wolf Lumber Company is his dearest business enemy, and the house whose exhibit he always tries to "skin" at the shows.

"Yes," continues Smith, declining to be discouraged, "they told me that the dealers in the corn belt are falling over themselves getting in line for number Twenty-seven, that new colonial writing-table of theirs—"

"Quit your kidding, Smith," interrupts the furniture man. "Those people won't be able to sell that table. It looks like a cross between an old-fashioned spinet and a typewriter desk. Why, we've got a table that beats theirs all hollow, and I'd like to bet some real money that we have more orders for our number forty-three than they'll handle on that colonial misfit all season."

Smith nods in agreement as though to say, "No doubt, no doubt." Then he continues, without permitting the discussion to even begin to look like an argument. "They're pretty well stocked up, as I noticed in going through the warehouse, but they are beginning to ship some carload lots to the West and say that they haven't any surplus to go on."

"Oh, the West is in good shape all right," conceded the furniture man. "Our Seattle branch has already reported that they will be able to sell twenty-five carloads more than they did last season, unless something happens."

"Gad, I'm glad to hear it," exclaims Smith. "Charley Williams is out there for you now, isn't he? How's Charley?"

"Getting along all right. He's been making good for us on the coast, and I think in another year or two we'll have to give him the job of general sales manager and call him back home."

By this time the furniture man has quit thinking about the dark side of the situation, and is realizing that business is looking pretty good, after all. And, of course, with Smith, who knows the furniture business thoroughly, there is no use of putting up a calamity howl just to keep from buying any lumber; if he needed any, though, Smith would get his share.

"Let's see," the lumberman breaks in. "The last lot of No. 1 common plain oak you got was delivered here at \$35, wasn't it?"

"Ye-es, I believe it was," says the buyer.

"Well, this little flurry in the lumber business, which is going to be over in thirty days, judging from the way general business is picking up, has caused our office to put plain oak on the list at a price which will enable me to deliver it to you here at \$33, inspection guaranteed. I haven't been pushing that particularly, because, personally, I think the price is low. In my opinion, conditions are going to be so much better this fall, when our manufacturers get the benefit of the reduction on imported goods, that lumber and all other raw materials are going to go 'way up. Doesn't \$33 look good to you?"

"Yes, it would, if I needed any lumber," replies the furniture man. "But the fact is—"

"The fact is," smiles Smith, pulling his coup de grâce, "you haven't more than three weeks' supply ahead. I was talking to Bill, the superintendent, as I came in, and he says the way you're cutting up stock now you'll have to buy before long."

"Why, you rascal," laughs the furniture manufacturer, forgetting to be angry at this exposure of his situation, "what do you mean by corrupting my employees? I guess I'll have to take a couple of cars, if that's the case. But don't think I'd take it from you unless the price was right."

"Of course not," says Smith, letting his customer sign on the dotted line. "But my prices, to you, are always right."

And that's how Smith manages to keep the Bungtown Lumber Company on the map when business is dull.

Commercial Uses of Sabicu

Sabieu (*Pithecolobium arborum* (L.) Urb.) is a West Indian tree of the pea family (*Leguminosae*), the wood of which possesses considerable merit as a mahogany substitute. Thus far very little effort has been made to give it a thorough trial in the United States. It is reported that in 1904 about twenty-five carloads of this wood were used by one concern in this country, and since then small consignments were shipped from Cuba to the New York market and sold as a furniture wood. Sabieu was first introduced into the London and Liverpool markets in 1878, when 167 tons were consumed, largely for the manufacture of shuttles and bobbins for cotton mills. A year later 101 tons were used in England, largely for shuttles, but it soon became too expensive and is now imported into the United States and England in a small way, chiefly for making furniture. The wood is now highly esteemed by a good many furniture and cabinet makers.

The tree is a native of all the islands of the West Indies, but it is most abundant in Cuba, where it is confined chiefly to the valleys, canyons and moister slopes. It occurs also in Trinidad and along the east coast of Central America and southern Mexico. There are no records which show that this tree has been exploited except in Cuba, and only for local use in Jamaica and Porto Rico. It is said to be very abundant in the interior of Haiti and Santo Domingo, where the forests are virgin and sabieu is available in considerable quantities.

Sabieu is closely related to the famous saman or Peruvian rain tree (*Pithecolobium saman* (Jacq.) Benth.), so common throughout tropical America. The sabieu here referred to must not be confused with jiqua (*Lysitoma sabicu* Benth.), which is also known as sabicu in the West Indies. The latter is more commonly called Bahama sabieu, but is botanically related to the Cuban sabieu, which develops into a much larger tree and the wood of which can be procured in greater abundance. It is said to be almost as common as the Spanish cedar. The Cuban sabieu is a very fast-growing tree and often attains the height of 150 feet and a diameter of over six feet. Similar to the wide-spreading saman tree the sabieu has a very branchy, open crown and a comparatively short bole, so that even the largest trees yield only between 2,000 and 3,000 board feet of lumber.

The wood of sabieu closely resembles the true mahogany in grain and quality, but it is somewhat harder and is of a reddish color. It is perhaps slightly coarser-grained than mahogany and exhibits more pronounced annual rings of growth, owing to the single row of pores that are developed during the early part of the growing season. It is often very beautifully figured and in this condition is sometimes preferred to mahogany for special purposes. It is hard, heavy (about forty-three pounds per cubic foot), strong, rather tough and dark chestnut-brown, tinged with red. Sabieu is susceptible of a high polish, very durable when exposed to alternations of air and water and is usually free from shakes. It seasons slowly but does not check in the process.

Sabieu is used extensively for building purposes and general carpentry work. Since the wood is durable it is employed for boat and house construction in Cuba and Jamaica. Its great strength renders it a good wood for use by the wheelwright, especially for the hubs of wheels. Hub billets, 19 to 18 inches in diameter and three feet long, sell for from \$3 to \$4 apiece. The wood is used both locally and abroad for making furniture and selected material sells for from \$50 to \$200 per thousand board feet in the Havana markets. In England it is used for shuttles and bobbins for use in cotton mills.

The better wood engravings are made almost exclusively of boxwood, and the large blocks are made of small pieces glued together. The engraving is done across the end of the grain. Japanese wood prints, on the other hand, are made on lengthwise sections of cherry wood parallel to the grain.

Throughout the national forests the rangers are posting the roads with permanent guide signs which tell distances and directions, especially at forks and cross-roads. The signs are usually put up in the winter when other work tends to be light. On some forests the rangers go on snowshoes, dragging loaded sleds, and nail the signboards to the roadside trees.

War Orders for United States

Our export business has greatly increased along several lines on account of the war. In September, 1913, we exported wheat to the amount of 11,956,800 bushels, and during September just past the exports rose to 25,765,047 bushels. Beef likewise shows a large increase when the shipments to foreign countries in September, 1913, are compared with this year's exports. The former totaled 633,289 pounds, the latter 6,984,184 pounds, more than a ten-fold increase.

It is known that many large orders for various articles are coming from the belligerent nations, but some of these are kept as secret as possible, and it is difficult to find out the exact sizes of the orders or their destinations.

A late issue of *Dun's Review* says that business has been done by textile manufacturers on goods that will eventually find their way to the countries that are at war. A much heavier movement is looked for as many firm orders have been submitted and are now being figured on. At least 750,000 wool blankets for soldiers' use have been bought and more are being sought. Sales of 600,000 cotton towels have been made. About 36,000 dozen sheets, 72x90, have been bought or contracted for. Four New York state underwear mills have engaged to deliver about 600,000 garments in the next sixty days and as many more as they can make in the time limit fixed. Orders are being completed for the purchase of 500,000 pairs of wool hosiery to be shipped at the earliest possible date. Considerable quantities of duck have been bought, but there are several large orders for khaki and army duck pending, and which will probably be closed in the next few days. Converters of cotton and cotton goods who make hospital supplies have received large orders and mills are at work on various lines of absorbent cottons and bandage cloths.

There are reports of orders for automobiles and power trucks which, if not greatly exaggerated, will keep some of the largest factories in this country busy for sometime. It is said that the French government has bought 1,000 motor trucks from a Michigan manufacturer, and Russia has also placed large orders for trucks.

HIGH PRICES FOR COPPER

Twenty cents a pound has been paid for copper in Germany to an American producer. It is understood that the metal was booked through a large selling agency for the account of a mining company.

This high price, coming almost simultaneously with the establishment of the lowest domestic quotation in more than a decade, has brought about the widest margin ever recorded between the foreign and domestic prices for copper metal.

Practically all of the copper in warehouses in Holland, aside from that shipped back to England, has been sent on to Germany for government use.

Modern warfare makes enormous demands on copper, for cart-ridges, electric wiring, and other purposes. This metal is contraband, but the warring nations will make great efforts to procure it.

BARBED WIRE ENTANGLEMENTS

Entanglements of barbed wire in front of entrenchments and other fortifications are an essential in modern warfare, and many stories have been told of the use of this material in the present war, and the armies evidently intend to continue. Pittsburgh advices of October 9 said Russia and Austria within the previous two days had placed orders there for 75,000 reels of barbed wire. These orders were divided between the Pittsburgh Steel Company at Monessen and the American Steel and Wire Company. Within the previous ten days orders for more than half a million reels of barbed wire had been received by plants in Pennsylvania from countries now engaged in the European war.

PREPARING FOR WINTER

The Reznor Stove Company of Mercer, Pa., has booked an order for 50,000 sheet metal tent stoves to be used by French and British soldiers during the winter campaign. These stoves are conical in form, light in weight and built for hard usage. They will burn either coal or wood. They are to be built in "take down" style and when stowed away will occupy little space.

Negotiations between the Reznor Company and representatives of the French government have been under way for some time. According to officials of the company orders for more than 200,000 of these stoves have been given out, or will be given out within the next ten days.

The Dunn Woolen Company, at Martinsburg, W. Va., has closed a contract with the British government for 2,000,000 woolen blankets for use in the British army. The order was obtained through agents, who said that quick delivery would be one of the prime factors in receiving other big orders for the firm.

The first shipment was started October 9. According to officials of the woolen company, it will take six months, working day and night shifts, to complete the order, which is one of the largest ever given in this country. It was also said that similar contracts with other European governments are being negotiated.

Counting the orders already received or practically completed in underwear and sweater coats, it is certain that at least ten different mills in New York state alone are working on army orders.

In the past few days substantial sales of army duck and other kinds of lightweight duck available for war purposes have been made by leading factors in the trade, shipments to be made at once from stock held in New York. It is stated that fully \$300,000 worth of duck has been bought within a short time, principally from three or four factors, and all for immediate shipment.

OTHER MATERIALS

It is reported that more than 200,000 cavalry saddles have been purchased in the United States, and thousands of horses have been bought and are to be shipped through Canada or by way of New Orleans. Orders for 5,000 tons of bituminous coal a month, for delivery in British Guiana, in South America, have gone to Pittsburgh parties.

These orders, and many others which have doubtless been placed, or will be placed in this country, will reflect on all business. The \$20,000,000 a day which the warring nations are spending cannot fail to stimulate American business.

Some Fruits of Frugality

They perhaps call it frugality—this habit on the part of lumber consumers of buying in limited quantities and waiting until they need something to give an order for it. They effect a saving in capital investment in the stock of lumber carried on hand ahead of needs. However, once in a while it bears other fruits than this—fruits which may be classed under the general term of disappointment. With the closing down for a while of many of the mills which serve the hardwood trade it is nothing unusual to find one of these hand-to-mouth city customers who want something in a hurry that the mill is not able to supply. With the mill in operation it has been practical by a little extra trouble to cut to order just whatever dimensions might be wanted, but with the mills down some buyers are meeting with enough disappointment to realize that there are advantages in buying quantities of stock and carrying it ahead of needs. There are other advantages than having it when it is wanted quickly. Stock bought in quantities ahead of needs can generally be bought at somewhat closer prices and in the buying and handling of quantities, enough economy can be effected to justify the investment and the yard space and the handling. Thrift and frugality are good things, but it is possible to get too much of even a good thing, and the best of things when carried to extremes develop objectionable qualities. If there ever were a time when the chances looked good for investing in stocks of lumber and carrying quantities ahead of the needs that time is right now. There may be excuse for frugal buying when prices are extremely high and the supply is limited, but where quantities are easily available and prices low, the part of wisdom would seem to be that of buying at least a quantity ahead of needs as would guard against delays in work and disappointments when seeking something special on short notice.

Seeking the Largest Trees

Foresters of the United States are interested in the announcement recently made by the American Genetic Association that two prizes of \$100 each have been offered for two photographs—one of the largest tree of a nut-bearing variety in the United States, and one of the largest broad-leaf tree which does not bear edible seeds. In the first class, for example, are included trees such as chestnut, oak, walnut, butternut, and pecan; and in the second, trees such as elm, birch, maple, cottonwood, and tulip poplar. No photographs of cone-bearing trees are wanted, since it is definitely known that the California bigtrees have no rivals among conifers. At a later time the association may take up the same question as between the various kinds of conifers,—as pines, spruces, firs, cedars, and cypresses.

The purpose of the competition, as stated by the association, is to find out in what regions the native trees attain their largest growth, and under what conditions they thrive best. When those large trees are located in the measurements authenticated, the association hopes that it may be possible to secure seeds, cuttings, or grafting wood from thrifty trees in the region where they grow, to see whether finer specimens may be propagated in other parts of the country. It is hoped in this manner to get some particularly choice strains of native trees established in regions where good specimens are not now found.

As much information as possible should be furnished about the tree in question, and exact identification is particularly necessary. The measurements of the tree must be given in detail. In making them the only method which may be followed is to take the circumference of the trunk at five feet from the ground. It is desirable that the full height of the tree and spread of branches, as well as the girth, should be stated; if they cannot be measured exactly, they should be estimated. Photographs should, when possible, contain some object, such as a human figure, or a horse and buggy, which will aid in giving a realization of the size of the tree. It is necessary that the one photograph should include the whole tree.

With each photograph, a statement should be submitted telling all that is known about the tree, with reference to its age, its fertility, the quality of the nuts (if it bears nuts), the character of the soil and surrounding vegetation. It is particularly necessary that photographers should state whether there are many other very large trees of the same species in the neighborhood—within a radius, say, of five miles. If the tree is on private land and likely to be destroyed, the fact should be mentioned. If there are any historical or literary associations connected with it, these should also be mentioned. It will be helpful if photographers can tell to what extent the tree is subject to attacks by disease or insects.

THE INFLUENCE OF HEREDITY

It is assumed by the association that seed from the region where the largest trees grow ought to produce larger and stronger trees than from regions where only small trees are found. By finding out where the large trees are and then, planting seeds from them in other locations, the association hopes to demonstrate the practical value to horticulture and forestry of the laws of heredity. Now that reforestation is becoming a pressing problem, the question of seed trees which will produce good offspring is coming to the fore.

Other influences, of course, will have a bearing on the subject, and the results of the investigation may help to settle the question as to whether trees can be acclimatized. Even if they can not be, there may be cases where trees in a new environment may make better growth than the best in their native range. This is said to be true of certain of the Australian eucalypts and of the Monterey pine, which does not amount to much in its native location in California, but has proved of great value in New Zealand.

The Forest Service has conducted some studies along this line and has discovered, for example, that the Douglas fir of the Rocky Mountains and the Douglas fir of the Pacific coast, while the same species, have different characteristics and will produce trees like the parent stock, modified somewhat, however, by environment. For example, if the two forms are planted together, during the earlier period of

life at least the Pacific coast form will make a larger and stronger growth than the Rocky Mountain tree, provided it is not affected by adverse local conditions.

Several other questions, such as the climatic requirements of trees grown in different localities, will, of course, enter into the final solution of the problem. It has been found in Germany, for example, that the Pacific coast form of Douglas fir is not so hardy as the Rocky Mountain form, which has to endure in its native habitat severe extremes of temperature, and German foresters have been working to discover a strain of Douglas fir which will combine, as far as possible, the hardness of the Rocky Mountain form and the large size of the Pacific coast form.

TREES ARE FASTIDIOUS

Some authorities go so far as to say that even the ingenuity and perseverance of man are unable to induce trees to change their habits far enough to adopt a country not closely like their native habitat.

This fastidiousness in the habits of trees has its good and its bad sides, they say. It absolutely limits the forester's choice of trees to grow in a given region. But, on the other hand, there is practical certainty of results. If beech or spruce thrives where the average warmth and moisture of the growing season from year to year ranges between certain degrees, then wherever else the same average is found, in the northern hemisphere at least, the forester may plant beech or spruce, whether or not they are already there, with confidence that they will flourish.

The announced purpose of the American Genetic Association is to bring about the dissemination of seed or stock of the best specimens, when found, to demonstrate, if possible, the value of heredity in tree growing. The contest for the \$100 photographs is announced to end on July 1, 1915, on which date the offer will terminate.

BUSY DAYS FOR UNCLE

Meeting of Michigan Lumbermen

The regular quarterly meeting of the Michigan Hardwood Manufacturers' Association, which was held at the Pontchartrain hotel, Detroit, Mich., on Thursday, October 22, was distinguished chiefly by its brevity and by the excellent report of the market conditions committee as read by the chairman, W. C. Hull.

The meeting opened with the usual roll call and reading of minutes, following which J. C. Knox read his report, here given:

Secretary's Report

It might not be out of place at the beginning of this report to state that late figures from the federal government place Michigan as twelfth in the production of lumber, our state having been displaced from tenth place a year ago by Virginia and West Virginia. It might also be well to inform the members that the production by the members of the association this year is an increase over a year ago by a considerable extent.

Our report today is about as complete a set of figures on hardwoods and hemlock as is possible to compile, for on October 1, 1914, we had the figures or a report from every member of our association. We are glad to see so many manufacturers here today, for we know by their presence that they are interested in their own success as well as in the success of the association.

In considering the stocks of hardwoods and hemlock on hand October 1, we wish to impress upon your mind the fact that from all indications the manufacturer is holding the bag, so to speak. The retail yard and the consuming manufacturer are not carrying the stock they used to, but are placing their orders with the manufacturers from time to time as they require them. We wish also to state that we have figures of four more members reporting October 1, 1914, than a year ago. Figuring on the stocks reported a year ago by firms not reporting and having cut out and taking the stocks of the new members not reporting a year ago, there is a difference of 23,000,000 feet of hardwoods and 14,000,000 feet of hemlock, which should be considered when taking into account the usual net stock for October 1.

Our treasurer's report shows a balance on hand October 16, of \$784.42 in the general fund and on October 19, of \$2,239.38 in the forest fire fund.

We are pleased to report that the Forest Service has taken care of \$580.50 of our wardens' salaries for the month of July, August, September and October. I also desire to state that the full assessment in the Forest Fire Protective Department fund has been collected for the entire year. Chief Warden Hickok will make a report for his department in full.

Camp costs, especially relating to the feeding of men and horses have been considered by manufacturers for past years and a report has been prepared by Mr. Langdon on the subject, which will be submitted today.

Treasurer Henry Ballou's report was read by the secretary and showed the condition of the treasury to be first-class.

President W. W. Mitchell called on the chairman of the respective standing committees, but the first three—the railroad committee, the legislative committee, and the grading rules committee—had no formal reports to make.

W. C. Hull, chairman of the market conditions committee, read a most excellent paper, as follows:

Market Conditions Committee Report

Conditions now confronting our association from the standpoint of stocks on hand unsold are not so good as we had hoped to see them. We have to go back as far as 1908 to find similar ones. At that time they aggregated 100,000,000 feet as against 120,000,000 feet at the present time, but a true comparison, on account of our seven new heavy producing members, would bring our present stocks on hand unsold to about the same figure of 100,000,000 feet as compared with 30,000,000 feet a year ago and 40,000,000 feet two years ago.

The situation is still further aggravated by the fact that a considerable portion of the stock sold but not shipped is quite likely to be turned back on the manufacturer's hands on account of some of the "fair weather" purchasers wincing on their contracts.

Of this unsold stock, compared to last year, there is three times as much No. 2 common and better and eight times as much No. 3 common as one year ago.

Against an estimate of 402,000,000 feet for 1913, we cut 440,000,000 feet; the estimate for 1914 was 458,000,000 feet, and judging from present reports this estimate has been or will be over-cut.

With prosperous business conditions the market might possibly have absorbed this increase, but it is futile to hope the present market can take care of it.

At our spring meeting, held in Chicago, the signs of depressed business conditions were very plain, and the remedy was suggested by your committee, but was evidently not heeded. As usual the law of supply and demand governs. This heavy production, coupled with the present weak market, has caused a decline in the price of most of the items we manufacture.

Your committee has carefully studied all the recent sales as reported to your secretary, and the attached price list is its best judgment as to present prices. There are rumors of quotations below this list on some of the items, but we were unable to verify them. The remarkable feature, however, is that prices have not broken worse than they have, and we have no doubt whatever that these rumors will soon become proven facts, providing our members continue producing at the present rate. No set of men were ever able to produce more of any commodity than the market could or would absorb and receive back a new dollar for an old one, and we do not believe the present case will prove to be the exception.

Unless we want to run our business at a loss and sacrifice our stumpage, secured by the most of us by hard work, sacrifices, thrift, daring and hardships, we must produce less lumber. We want you to study more carefully than you ever have heretofore the statistics as to stock as prepared by your secretary and handed to you with this report. If you will study them carefully, we feel sure that each and every one of you will decide to curtail your productions all you possibly can and then some.

If you will do this you will discover many encouraging signs; our competitors, as well as associates, some of them, have already seen the handwriting on the wall; many yellow pine and Pacific coast mills have shut down within the past thirty days; everywhere in all lines of building material there has been curtailment. Heretofore, the lumber trade has looked upon our association as one of the ablest in the field. Shall we fall in behind the yellow pine or Pacific coast associations? Shall it be said of us that the only arguments that appeal to us in the face of present conditions are that we are out of stumpage, cash or yard room?

The restoration to normal conditions will come much more rapidly if the lumber trade generally acts unanimously along these lines.

The war in Europe immediately threw back into an already inactive domestic market an output which at that time was more than normal, which resulted in paralyzing the usual business of the lumber interests. It is certainly the duty of the manufacturer and the trade generally to use their best legitimate efforts to prevent useless sacrifice in a commodity which has at all times a basic value far above what it could command under prevailing conditions. The remedy is plainly not to manufacture an increased, let alone a normal, supply in the face of a plainly restricted demand, and also to hold firmly to reasonable prices, notwithstanding the rapid accumulation of stocks in some hands. Cut prices never tended to accelerate the movement of any commodity, and never will, but on the contrary have always retarded it by creating a feeling of unrest, uncertainty and instability. The theory is that lower prices should increase the use of the commodity, but unfortunately the consuming customer does not receive the benefit, but the lower price is universally absorbed by the middleman; consumption is not increased, and the middleman smiles as he rakes in the profits belonging to and needed by the man whose effort produces the commodity. If the truth were known, we venture the opinion that not two per cent of the recent cuts in prices made by some of the members of our association ever reached the consumer or stimulated the movement of a single carload of lumber.

The most encouraging feature in the whole situation and the one that causes us to believe that the present low prices now being offered by some of our members will be withdrawn long before our next quarterly meeting, is the fact that the price of stumpage has remained absolutely firm and is in no danger of being broken. In this particular the lumber trade, and particularly this association, is most fortunately situated. There does not appear to be any danger anywhere of the sale of stumpage at sacrifice prices. We all know what our stumpage is worth, and we will not permit it to be sacrificed.

With the necessary curtailment the domestic market will sooner or later absorb present stocks, and then values of their own accord will return to the prices prevailing at the beginning of the year, and these low present prices, in some cases below the cost of production, will soon be a thing of the past.

An advance of rates of interest on building loans following the outbreak of the European war, hit the lumber trade an unusually severe blow, inasmuch as it greatly restricted building operations in large cities. There is every indication that this condition will largely pass away within the very near future. Action by government officials tending to put money into circulation, and the general loosening of financial conditions shown by reports from all parts of the country, are operating to turn more money into building channels, and though the usual season for building is now passing, there is every promise that an unusual amount of such activity will be in evidence during the winter, and a very large amount very early in the spring. The general condition of business over the country is much better than it has been within the last few months. Enormous crops have been harvested, and will find sale at unusually good prices. This fact will afford certain relief to the lumber trade. It is generally admitted that the farmer has not done his usual amount of building and repairing for a number of years, and necessity,

if not choice, will constrain him now to the spending of some of his very great plenty in the making of the necessary improvements about his farm. This will produce a keen demand for the necessary lumber during the coming winter and will make up in a large measure for the export business which has been lost and the diminishing of building operations in the cities.

During the last couple of weeks exports from the ports of New York and New Orleans have been resumed, on a small scale of course, but none the less they mark a tendency of conditions abroad to adjust themselves to the carrying on of considerable business even during time of war.

The fact remains that considerable lumber is required to meet current needs in the United States. It is, as all will recognize, an utter impossibility for this country to get along during any situation without the consumption of a very large quantity of lumber. The curtailment which should operate in practically all lumber trade circles should soon cause this domestic demand for lumber to consume the surplus.

The only difference of opinion that seems to be apparent relative to curtailment is in the manner in which it shall be done, which of course must be determined by the parties doing it, and in a manner which will best conserve and protect their future operations.

Everybody is doing the minimum amount of business. Jobbers have refused to speculate, and buy from hand to mouth. There is every reason to believe that movement of lumber has already receded to the lowest possible point. It must inevitably and soon respond actively to great natural conditions which require an increased consumption of lumber.

From now on wholesalers will require an increased amount of lumber. As business approaches a condition anywhere near normal they will need very heavy shipments and need them frequently.

It is probable that the lumber business will be among the last to feel the effects of the return of normal conditions, but it will be rewarded by an unusually heavy volume of business when that time does come.

A careful survey of the national situation cannot leave any one without an optimistic state of mind. A little patience, perhaps a little more of hardship is necessary, but by curtailing as much as possible, and holding firmly to present prices, no one of our members can fail to ultimately get back all that he has lost, and there is every reason to believe that the demand will be far greater than the production in normal years.

To cut prices now means only that a loss of property has been added to a loss of business. Lumber of any kind is valuable property, with normal prices, and to sacrifice it is to invite a disaster that will not be remedied by the return of better times.

HEMLOCK

Practically the same condition exists as on hardwood. Of water hemlock we have 22,000,000 on hand unsold as against 8,000,000 last year, and of rail hemlock we have 91,000,000 on hand unsold as against 55,000,000 last year. There have been so many different grades and customs and markets with our different members that it is difficult to get a line on values, but we find the values for water hemlock to be about \$14.50 for merchantable 10' to 16', \$16.50 for merchantable 18' and up, \$9.50 for cull, on dock or over rail at mill, according to the custom of the port. These values are \$1 to \$1.50 below those prevailing last spring. Rail hemlock is bringing correspondingly higher prices, according to location and grade.

HEMLOCK BARK

Forty members estimated they would peel 39,438 cords. In 1913 the actual peel as reported by forty-five members was 54,590 cords. Prices received for 1914 were about 75c per cord less than in 1913, the tanners having gone into the year with exceptionally large stocks on hand.

The paper was moved for acceptance and placed on file.

In the absence of F. L. Michelson, chairman of the forest fire prevention committee, the report of that committee was omitted and the president called on Chief Warden C. F. Hickok. The report covered the patrol season opening April 20 and closing October 10. In comparing seasons with those of 1912 and 1913, it was found that dry weather periods were more severe this year than the two years previous. In 1912 there were 227 fires discovered with a total acreage burned of 27,000 acres. In 1913, 299 fires with an area of 35,900 acres burned. This year there were 390 fires with an area of 88,134 acres. This was accounted for, in addition to the dry weather, by the accumulation of timber slashings during the two years previous. However, the burning over of this 88,000 acres of brush lands has reduced the hazard to normal conditions.

The report then summarized the costs of fires, showing that settlers, railroads and smokers are the primary causes, they being credited with 38.4%, 26.9% and 15.02%, respectively of the total number of fires.

The total losses aggregated in value \$11,793 and were divided between chemical wood, hemlock logs, standing timber and hemlock bark. The principal loss, however, was to chemical wood piled on ground where cut. Thousands of growths were saved by prompt measures which have been adopted to prevent fire in the vicinity of the association property.

The report stated that the average loss per year in the three years under the protection of the association was \$5,580. It also expresses the opinion that the aggregate loss for the years 1909, 1910 and 1911 was much in excess of losses recorded since the establishment of the protective measures.

The warden's report expressed pleasure for the greater co-operation which is being instituted between the public and the wardens of the department. Hundreds of people have signified their willingness to help and have taken intense interest in extinguishing fires before they were beyond control. The Federal Forest Service also has co-operated to the extent of allowing the payment of the salaries of three of the association's wardens. This amount aggregates \$580.50.

The report touched on the cases of two township officials who have refused to do their duty relative to forest fire prevention which are now in the hands of Governor Ferris. The association has been behind this effort and is pushing it vigorously.

C. A. Bigelow, in moving the acceptance of the report, also personally congratulated the chief warden on the effective work of his organization.

R. H. Rayburn, who was to have reported on the employers' liability law, being absent, N. M. Langdon was called upon to give the result of his investigation on camp cost. Mr. Langdon stated that the returns of his inquiries were very satisfactory, and of all replies received only seventeen gave statements as to cost figures. Most of these were on only a few items. He then read a compilation showing the cost of respective features of woods operations, which the secretary was instructed to get up in proper form and forward to members.

R. S. Kellogg, secretary of the Northern Hemlock and Hardwood Manufacturers' Association, was in attendance and, on being asked to express his opinion of camp costs, said that his organization has gone at the question in a little different manner, rather aiming to establish a standard of economic methods of feeding and camp regulations than to determine what costs now are. According to Mr. Kellogg, he is working on a plan for the establishment of a standard menu, copies of which he distributed among the members of the Michigan association. He said emphatically that a standard method of cost accounting is not only desirable but absolutely essential; that lumbermen cannot henceforth look for their profit to any great increase in the value of their commodities, but must rather aim at increasing profits by putting operations on a scientific and cost-reducing basis. He spoke further regarding camp provisions, saying that beef in the carcass this year will be at least twice what it was eight or ten years ago. He recommended salt fish as being the cheapest meat that can be served, and also stated that mutton will be the cheapest fresh meat, and is a desirable camp food, as it is palatable and contains as much food value as beef. He said further along the line of standard menus for camps that this, if carried out generally, would prevent men from jumping from one job to the other.

There was some discussion as to the best method for eliminating the unnecessary cost of free meal distribution, but no satisfactory conclusion was reached. The suggestion of one of the members that the best results would come from issuing meal tickets and compelling all diners to secure meal tickets from the foreman before eating, was about the only definite suggestion made. These tickets are free, but the average camp floater hesitates before asking the foreman for more than one ticket during one stay.

The following resolutions were then read, pertinent to the recent death of Fred A. Diggins of Cadillac:

In the passing of Fred Arden Diggins, the members of the Michigan Hardwood Manufacturers' Association have lost a wise counsellor, a safe guide, and an unselfish friend. Men followed him gladly, recognizing his innate genius for command. A natural captain of affairs, his viewpoint was broad and clear and sane. His advice was eagerly sought and commonly followed. A man of unswerving integrity, he held always to high ideals and fulfilled, in a manner beyond criticism, every trust.

But great as were his mental gifts, to those who knew him best, his attributes of heart meant even more. He was always the courteous, considerate and kindly gentleman. His friendship was a privilege and his character an inspiration.

While tendering to his family our sincerest sympathy and condolence, we yet rejoice with them in those high qualities of his life which have made his memory so rich a heritage.

C. A. Bigelow moved that the resolutions be made part of the official record.

It was moved and carried that an assessment of two cents a thousand feet of lumber actually shipped from October 1, 1913, to October 1, 1914, be levied, one-half on December 1 and one-half on May 1. This motion carried with it the provision that the minimum assess-

ment be \$20. This plan was formulated six months ago.

G. von Platen made some earnest suggestions regarding stocks at northern mills and relative to the necessity for conservative operating during the winter. On motion the meeting adjourned.

Tales of the Trade

He Drove Right In and Turned Around—Then Turned Around Again

A. F. Aley of the Aley Lumber Company of Escanaba, Mich., hasn't always been a lumberman, nor has he always driven an automobile. There was a time, several years ago, when Aley dealt in ham, loins and other products of the hog and at that time he bought an automobile to expedite the handling of the country trade near Escanaba. Notwithstanding the fact that this is in reality several years old it has just been disclosed and is again fresh in Aley's mind, thanks to Escanaba friends.

Aley bought the car, made not quite the usual number of trips with the instructing salesman and then pronounced himself fully capable of running it, and a few mornings after he bought the machine Aley started, big as Bob Burman, away from the garage. The machine had been started by a garage man and Aley got away nicely because if there was anything he could do it was steer. Fortunately for himself, he kept on low speed.

The first customer was a butcher and grocer at a village named Cornell. He heard Aley coming and was out in front to see the new motor. He started out into the road, but backed speedily away as he saw Aley was not slowing up but was apparently fussing with the machine. It was well for him that he backed away because the car kept right on going. The store was so situated that the machine had a safe circle around it. Aley made the circle a few times, but he knew that wasn't getting orders but rather laughs from the customer and the usual country store followers of Old Dobbin. It was then Aley placed himself at the head of Escanaba's salesmen.

With one arm crooked in the steering wheel and with his note book firmly on top of the wheel Aley was ready to sell. In the meantime the auto had become a mechanical toy, traveling in a given circle around the store building. On the front porch stood the storekeeper and his following, while around and around went Aley.

"All ready," said Aley, premier salesman, as he passed the front on one lap.

"Ham," yelled the storekeeper.

"Smoked, boiled or fresh?" questioned Aley with due gravity, as he made the next lap.

And so the order was taken and Aley, it is said, never sold small orders. With the last item down in black and white, Aley made one more lap in which to say "Thank you, goodbye," and was safely on the return to Escanaba. As has been said before, he could run the car, even though he could not stop it, and being the original pilot, once at the garage door it was no trick to stop the motor without putting it permanently out of business.

Cutting the Melon for Clinty

"Speaking of practical jokes" said T. E. Youngblood, general manager Chicago office of the Payson Smith Lumber Company, "reminds me of one that I played on a lumberman neighbor several years ago which afforded about as much amusement as anything I've ever engaged in. This party, who for the sake of his feelings, we will call Mr. Warren, was somewhat of a kidder himself and there was something continually going on between us as he lived next door.

"One Sunday about dinner time, happening to spy a half watermelon under the kitchen sink, which had been discarded by my wife on account of being too green, a happy thought struck me, which I proceeded to put into execution. Securing a carving knife I sliced off a layer leaving the top looking rather red and juicy, then proceeded to plug it, taking out the plug carefully, then scooped out the inside with a large kitchen spoon and filled the interior with corn

cobs and dry bread, taking care to replug it nicely.

"I went to the phone and called Mr. Warren asking if he would like a half a watermelon for dinner. It seems that Mrs. Warren's brother was visiting there from Montana and she had intended to have peaches and cream for dinner but on questioning him as to whether he would prefer this fruit or watermelon ("which Mr. Youngblood has so generously offered us") he stated that he could get peaches and cream any time but watermelons were very scarce in Montana at that time. Mr. Warren came to the back door and secured the melon paying a handsome compliment to me for my generosity and being very profuse in his thanks.

"When his wife essayed to cut the melon with the bread knife, about the second stroke convinced her that the melon wasn't as ripe as it looked, she having landed on one of the cobs.

"What's the matter, Dear?" asked Mr. Warren, "Come here Clinty and I will show you" replied his wife. "No tell it to me" he answered. "You will have to come and see it as I can't tell it," returned Mrs. Warren.

"After the joke settled thoroughly into Mr. Warren's interior consciousness there was war in the neighborhood for several days and any presents that I sent him later were looked on with suspicion and no thanks were forthcoming until a clean bill had been rendered."

POOR FELLER, THEY SAY IT WAS CARBOLIC ACID—YOU KNOW HE BET ON PHILADELPHIA.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 807—Wants to Get in Touch with Manufacturers of Figured Gum Dressers and Chiffoniers

Louisville, Ky., October 19.—Editor HARDWOOD RECORD: One of our customers has written us for information as to a source of supply for chairs and dressing tables constructed of figured gum. Can you obtain this information for us?

This inquirer has been given a short list of manufacturers in that particular line. Others interested can have the necessary information by addressing HARDWOOD RECORD office.—EDITOR.

B 808—Wants Name of Parties Using Beech

Lexington, Ky., October 14.—Editor HARDWOOD RECORD: Can you give us the names of manufacturers of wooden clothespins, which we understand are made of beech? We are interested in getting in touch with parties using beech.

The information requested has been supplied to the above correspondent. Those interested may have the address by writing HARDWOOD RECORD.—EDITOR.

B 809—Wants to Sell Birdseye Maple Logs in Michigan

Muskegon, Mich., October 14.—Editor HARDWOOD RECORD: Can you furnish us with a list of users or probable buyers of birdseye maple logs contiguous to this territory? Shipments of these logs would be made from the upper peninsula on the Soo rate of freight. Your prompt attention will be greatly appreciated.

This company has been given a list of manufacturers in this particular line. Others interested should address this office.—EDITOR.

B 810—Wants to Get in Touch with Northern and Southern Hardwood Mills Interested in Special Dimension Stock

Chicago, Ill., October 16.—Editor HARDWOOD RECORD: Can you give us the names of a number of hardwood mills, both in the North and in the South, which would be interested in getting out dimension stock in small sizes? We are particularly interested in getting in touch with some up-to-date mills that are anxious to utilize as much of their present waste material as they possibly can.

The concern writing this letter is in a position to put the dimension stock business on a really profitable basis. Any mills in a position to consider the manufacture of special dimension stock for the utilization of small waste would find it to their financial advantage to communicate, through this office, with the above inquirer.—EDITOR.

B 811—Wants to Buy Basswood Logs on Eastern Freight

New York, N. Y., October 16.—Editor HARDWOOD RECORD: We would like to get in touch with some mill from which we could obtain some basswood logs. We can use a number of cars of this stock. Would like to get them from a point on a low rate of freight to New York City. Do you know of any manufacturer from whom we could obtain these logs?

Interested parties can have the necessary information by addressing HARDWOOD RECORD.—EDITOR.

B 812—Wants Oak Truck Poles

New York, N. Y., October 15.—Editor HARDWOOD RECORD: Will you be so kind as to give me the names of a few reliable mills who can get out white oak truck poles? Can use oak and ash poles in the same car.

A short list of manufacturers of the stock referred to has been given the inquirer. Anyone interested can have the address upon application to HARDWOOD RECORD office.—EDITOR.

B 813—Wants Quotations on Odorless Veneers for Packing

Chicago, Ill., October 13.—Editor HARDWOOD RECORD: We are interested in securing maple or other odorless woods for use in packing some of our products. Same is cut in sheets 18"x12", one-twentieth of an inch thick. Will you please advise if you can give us the names of any concerns who make a specialty of this class of veneer?

The concern inquiring is one of the biggest packing companies in Chicago. HARDWOOD RECORD has given the names of a few com-

panies who might be in a position to quote on this line of stock. Others interested should address this office.—EDITOR.

B 814—Wants Dimension and Furniture Parts

Bloomington, Ind., October 14.—Editor HARDWOOD RECORD: We will be pleased to have you mail us, if you have such, the names and addresses of concerns who are manufacturing and selling wood dimension and furniture parts. By this we mean all the wood parts that go to make up ordinary furniture. Any information that you can furnish along this line will be greatly appreciated.

Interested parties should write this office.—EDITOR.

B 815—Wants Market for Birch, Beech and Maple Dimension Stock

Thomson, N. Y., October 12.—Editor HARDWOOD RECORD: We make a specialty of manufacturing and curing the better grades of birch lumber, and especially in extra thicknesses, lengths and widths. This birch is marketed under the title of Sagamore birch and is enjoying a splendid reputation.

Could you put us in touch with parties in the eastern states who are in the market for birch, beech and maple dimension stock? We manufactured about 1,000,000 feet of dimension stock last year and seek new business to further work up our waste.

Those interested will be furnished with the address of our correspondent, upon application to this office.—EDITOR.

B 816—Pass It Along

HARDWOOD RECORD has believed for some time that the one cause which, above all others, is keeping American business in a depressed condition is the flaring and glaring accounts given of war which readers of the daily press are forced to consume in large doses before and after practically every meal during every day of the week and month. Believing that if this war news were kept on less prominent pages than the very front of the paper, and believing that with sufficient pressure the leading dailies could be brought to make this change in policy in spite of the fact that the war news is of tremendous news value, HARDWOOD RECORD has started a little endless chain in order to work up this desired pressure.

There were sent out from this office a considerable number of letters to prominent business men, enclosing a copy of our letter to leading Chicago dailies, and suggesting that each address three friends asking each to write the papers he reads and to in turn write three friends making the same double request. In this way an endless chain of correspondence would be started, which, if carried on as we hope it will be, would ultimately have a tremendous scope.

These letters were issued just a few days before press day and the following are the three first replies received:

Asheville, N. C., October 19.—Editor HARDWOOD RECORD: We are in receipt of your favor of October 17 enclosing us a copy of a letter addressed to the leading dailies of Chicago by yourself.

We are of the opinion that your suggestion is a very good one and have acted upon it by sending a copy of your enclosure to our daily papers and a letter to three of our customers. It is possible, and I hope it will prove profitable to divert the minds of business men from war to business. We, ourselves, can see no reason why business should not be good here in the United States with a ready market at the highest market prices for all of our farm products, outside of cotton, together with a market for all of our manufactured goods in Europe and South America.

We think a little talk on business worth more than all of the war news the daily papers are able to publish.

ASHEVILLE LUMBER COMPANY,
By W. N. Cooper, President.

Muskegon, Mich., October 19.—Editor HARDWOOD RECORD: I have your letter of the 17th inclosing copy of a letter you have written to 200 lumbermen, and I want to compliment you on the stand you have taken, and have immediately sent copies of your letters on to our two local newspapers and three of my business acquaintances, in different lines.

Let us hope that the waves which you have started by dropping this little petal into the sea of business depression will expand until they cover the whole United States.

Here is wishing you more power.

F. C. MORSE,
Secretary Brown-Morse Company.

Wausau, Wis., October 20.—Editor HARDWOOD RECORD: Your letter of October 15 was received a few days ago. I have just dictated letters to the Milwaukee Sentinel and the Chicago Record Herald, which chance to be the dailies I take, and I trust that my contribution will help along the movement you have started.

With many thanks for the suggestion.

R. S. KELLOGG,
Secretary Northern Hemlock and Hardwood Manufacturers' Association.

Clubs and Associations

The Southern Logging Association

The following is the program of annual meeting of the Southern Logging Superintendents' Association to be held at Grunewald hotel, New Orleans:

OCTOBER 26—9 A. M.

President's Address, J. B. Baker
Secretary-Treasurer's Report, James Boyd
Address, "Small Timber and Logging Costs",
W. W. Ashe, Forest Inspector U. S. Forest Service

DISCUSSION

OCTOBER 26—2 P. M.

Address, "Feeding Horses, Mules and Oxen Used in Logging Operations,"
Dr. W. H. Dalrymple, Professor of Veterinary Science,
Louisiana State University, and Veterinarian to the
State Experiment Stations.

DISCUSSION

Symposium—Locating main line and spurs for hardwood operations in level and hilly country and swamps. Cost of laying steel; weight of rail for various conditions; types of ties; size of spikes and method of spiking; types of bridge and trestle construction. Daily task of steel gang.

Symposium—Locating main line and spurs for yellow pine operations in level and hilly country and swamps. Cost of laying steel; weight of rail for various conditions; types of ties; size of spikes and method of spiking. Types of bridges and trestle construction. Daily task of steel gang.

Symposium—Locating logging roads and spurs in cypress operations. Types of bridges and trestle construction. Cost of laying steel; weight of rail for various conditions; types of ties; cost; size of spikes; method of spiking. Daily task of steel gang.

Symposium—Pull-boat operations. Locating canals, widths, depth, types of dredges; distance apart and length of runs; character of runs; cost of cutting runs; types of pull-boats. Number of men employed. Daily task. Cost per thousand. Methods of prolonging life of wire rope. How many million feet of logs should a rope pull? Sizes used. What size logs are left?

TUESDAY, OCTOBER 27—9 A. M.

Address, "Prevention of Accidents," by C. P. Myer, Assistant General Manager of the Kirby Lumber Company, Houston, Texas, and Vice-President of the Southern Logging Association.

DISCUSSION

Symposium—Skidding Practice in Yellow Pine Operations. Time required to move; distance; acreage covered; stand per acre at each setting. Skidding in level and hilly country compared. Length of haul. Rehaults and teams. Methods for prolonging usefulness of wire rope. How many million feet should a wire rope pull? Number of men in skidding crew. Costs and task. What is left in the woods? Height of stumps.

Symposium—Skidding Practice in Hardwood Operations. Time required to move; distance; acreage covered; stand per acre at each setting. Skidding in level and hilly country compared. Length of haul. Rehaults and teams. Ground and overhead skidders. Methods of prolonging the life of wire rope. How many million feet should a wire rope pull? Number of men in skidding crew. Costs and task. What is left in woods. Height of stumps.

TUESDAY, OCTOBER 27—2 P. M.

Symposium—Skidding practice in cypress operations. Time required to move; distance; acreage; stand per acre at each setting. Ground and overhead skidders compared. Length of haul; rehaults and teams. Methods of prolonging usefulness of wire rope. How many feet should a wire rope pull? Number of men in skidding crew. Costs and task.

Symposium—Cutting logs hardwoods, pine, cypress. Costs. Is it any advantage to contract log cutting?

Symposium—Log loading—Costs when loader is used and when not used. Hardwood, pine, cypress. Crew required.

Symposium—Hiring men. Camp Construction. Boarding House Costs. Bill of Fare.

OCTOBER 28—9 A. M.

Address, "First Aid—How Accident Cases Are Treated to Minimize the Effects of Injuries," illustrated, by Physician of the Crossett Lumber Company.

DISCUSSION

Address, "Camp Sanitation," by Dr. R. B. Austin, Camp Physician, Fernwood Lumber Company.

DISCUSSION

Camp Construction.
Home-made Devices.
Uniform Cost Sheets.

Continuation of discussion of topics discussed first two days.
Address, "Logging in Southern Brazil," by G. W. Patterson, Southern Brazil & Lumber Colonization Company—a member of The Southern Logging Association.

OCTOBER 28—2 P. M.

Discussion of answers to 223 practical questions on logging of hardwood, pine and cypress.

Election of officers.

Adjournment.

New York Lumber Trade Association to Meet

The New York Lumber Trade Association will hold its twenty-sixth annual meeting on Thursday, November 11. The session will convene at headquarters of the organization, 18 Broadway, and will be preceded by the usual luncheon served by Delmonico. Every effort will be made to bring out a record attendance at this annual which promises to be as interesting as any ever held. No announcement has been made as to the election of officers.

Cypress Meeting Announced

Secretary Geo. E. Watson of the Southern Cypress Manufacturers' Association announces that the semi-annual meeting of the association will be held in New Orleans on November 18.

The Hardwood Manufacturers' Association to Meet in Cincinnati

The board of directors of the Hardwood Manufacturers' Association of the United States at its quarterly meeting at Cincinnati on October 10, decided to hold its next annual convention at Cincinnati, January 28-29. The sessions will be held at the Hotel Sinton.

This will be the thirteenth annual meeting, and the fifth to be held in Cincinnati. The 1914 meeting was held in Memphis, January 21-22.

While the Memphis meeting was one of the largest ever held, registering about 700, it is expected that the convention at Cincinnati next January will eclipse this in attendance. It has been found that Cincinnati is a very advantageous place to hold this convention, it being on the dividing line between the great producing fields in the South and South-east and the consuming markets in the North and Northeast. Fully two-thirds of the membership and visitors are not over twenty-four hours distant from Cincinnati.

Memphians Cheerful in Spite of Hard Times

The regular semi-monthly meeting of the Lumbermen's Club of Memphis, held at the Hotel Gayoso, October 17, proved one of the most enthusiastic for quite a long while. The attendance was unusually large, and, considering the fact that the lumber business is very quiet, the members were in exceptionally good spirits. J. D. Allen, who has recently returned from a tour of the western states, was in the chair. C. G. Kadel, secretary, also performed his usual duties.

F. L. Stonebraker, chairman of the entertainment committee, said that some of the members had spoken to him about another dance at the Hotel Chisen. He said that he and the other members of the committee were ready to serve the club. Later, on motion, the committee was authorized to select the date and make the other necessary arrangements. Announcement will be made within the next few days as to the time selected. There is just a suggestion that J. P. McSweeney is responsible for this function. It is understood that he has been making inquiry among some of his friends recently as to a good person from whom to take lessons in the tango, hesitation waltz, and the other late steps. If this be true, Mr. McSweeney is only following in the footsteps of S. M. Nickey, S. B. Anderson, R. J. Barnell, and some of the other gentlemen who have only recently taken up dancing as one of their particular sources of amusement.

J. W. McClure, of the river and rail committee, called attention of the members of the club to the forthcoming rate contests which will be handled by the Southern Hardwood Traffic Association. These are the proposed 5 per cent advance on hardwood lumber shipments in the territory north of the Ohio and east of the Mississippi river and the advance of 5 to 33 1/3 per cent in rates on shipments of hardwood lumber from Memphis and points in Mississippi and Louisiana to Ohio river crossings. He pointed out that there were a number of members of the club who were not connected with the association, but declared that, while the association was taking the leading part in these contests, every member of the club should do his very best, since regardless of the amount of lumber shipped, each is vitally interested. He said that the lumbermen had always stood together and that, if there were ever a time when this course ought to be pursued, it was in the present instance. President Allen emphasized what Mr. McClure had said and urged everybody to do his full share.

Jas. E. Stark, of Jas. E. Stark & Co., not only emphasized what the two former speakers had said, but declared that it was necessary to do a great deal of missionary work to get the lumbermen together to make the fight ahead of them. He said some of the lumbermen with whom he had recently talked had been in favor of giving the roads higher rates in the belief that better business would result. Mr. Stark thought there was absolute necessity for all the lumbermen to take exactly the same view of these proposed advances and asserted that, if they did not do so, the fight would certainly be an up hill one. He concluded with the declaration that the Southern Hardwood Traffic Association deserves the support of every lumberman, whether he is a member of the organization or not.

The club received a very interesting compilation from May Brothers, showing the extent of milling operations in this territory. This firm sent 1200 letters to millmen in Mississippi, Alabama, Arkansas, Louisiana, and Tennessee, to which 189 replies were received. These showed that there were 126 mills entirely closed down, 21 running on short time, 27 operating at full capacity, and 15 not reporting as to this feature. With reference to stocks, it showed that 47 mills had more than normal, 45 about the same amount as usual and 45 less than normal. The other 52 did not touch on this phase. This is the most accurate information which has been gotten up regarding operations in this section and it was ordered filed by the club.

The statistics committee reported that it had partially completed figures covering operations in hardwood lumber during the preceding year and asked that those who had not sent in their returns to do so at once. President Allen emphasized the desirability of this course and the committee is hopeful of having its report ready for the printers in a short time.

A. B. Turner, southern manager of the Poinsett Lumber and Manufacturing Company, with offices in Memphis and mill at Trumann, Ark., was elected an active member.

T. R. Winfield, president of the Business Men's Club, addressed the

meeting on the affiliation as between the two organizations. Mr. Winfield said, among other things, that there was no question that the Lumbermen's Club of Memphis was the most loyal, the most active, and the most helpful of all of the organizations which have become affiliated with the Business Men's Club. This was as far as Mr. Winfield was able to go in sustaining the proposition laid down by President Allen, to the effect that the Lumbermen's Club had become such an important organization that it was wagging the dog, the dog in this case being the Business Men's Club.

A letter was received from Mrs. T. B. Allen, widow of the late T. B. Allen, an honorary member of the club, thanking the club for the resolutions recently adopted in connection with the death of her husband. It was sent from Galveston, Texas.

A letter was read from the publicity division of the National Rivers and Harbors Congress setting forth the amount of money that had been appropriated for the use of rivers and harbors. The item most of interest to the Lumbermen's Club of Memphis was that to the effect that \$3,750,000 was available for use on the Mississippi from the mouth of the Ohio southward.

The Evansville (Ind.) Lumbermen's Club advised the local organization that it has received a letter from D. M. Goodwyn, general freight agent of the Louisville & Nashville, in which he refused to grant more favorable milling-in-transit rates. The letter stated that this official had declined for various reasons, none of which was considered good. This club also asked the local organization to co-operate with the Evansville Club in the effort of the latter to secure more than one year as the time limit for reshipping under the milling-in-transit privileges.

Among the guests present was S. G. Boyd of the Cincinnati Veneer & Lumber Company. He was called on for a talk, and responded very briefly.

Hoo-Hoo House Dedicated

On October 17 at San Francisco the Hoo-Hoo House was dedicated, or more properly, the ground on which it will stand was dedicated, for the foundation has not yet been laid. This building will be lumbermen's headquarters at the Panama Exposition, and it is expected that it will be complete in ample time for the opening next February. The Hoo-Hoo members of the Pacific coast are building the house at their own cost, for the purpose of entertaining their eastern friends who plan to visit San Francisco next summer. The location of the building on the exposition grounds is all that could be desired. The determination to make the San Francisco world's fair surpass all expositions that have gone before seems in a fair way to be realized; and everything is to be ready promptly on the opening day.

An Appeal to Farmers

The National Implement and Vehicle Association has sent out a circular to the bankers of the country, asking them to appeal to the farmers with whom they come in contact, to the end that better farming methods and business principles be followed with regard to farm products. An extract from this appeal follows:

Urge the farmer who has harvested his grain, not to speculate on the fluctuation of future prices.

Recommend to the farmer of the South to diversify his crops. Experience has shown that a one crop country cannot continue to bring prosperity to its farmers. The great wheat states of the Dakotas are diversifying. Our cotton states should do likewise.

Preach preparedness for the 1915 harvest. Care in seed selection, proper tillage and cultivation will bring increased crops to meet the increased demands. More intensive cultivation quite as much as increased acreage will bring prosperity to the farmers.

Increase the number of farms raising stock and thereby secure a natural fertilizer for the soil. Cattle, hogs, and poultry mean ready money and bank accounts.

Secure for the agricultural community the benefits provided in the new currency law by creating a demand for the early opening of the various federal reserve banks.

Discourage all speculation, but encourage the expansion of legitimate business in the rural communities by reasonable extension of credit.

The agricultural communities and the bankers who serve them were never in a more secure position or one that promised more if the opportunities are embraced.

We hear on all sides that the European war has left the door wide open for this country to enter and secure the markets of the world. This cannot be done in a day or in a year. Let us first bring this country's industries back to their normal condition. This must be done before an increased foreign trade can be secured.

Southern Traffic Association Active

There was a meeting of the governing board of the Southern Hardwood Traffic Association in Memphis October 16, attended by practically every member. Like the general meeting held some time ago, however, it was executive and nothing was given out for publication beyond the fact that the principal subjects discussed were the 5 per cent advance in rates in the territory north of the Ohio and east of the Mississippi and the proposed increases of from 5 to 33 per cent in rates on oak, cottonwood and gum from Memphis and points in Mississippi and Louisiana to Ohio river crossings, together with the formulation of plans for effectively resisting these higher rates. The ground was very fully covered and the campaign of opposition has already assumed definite enough shape to enable the lumbermen to begin the compilation of data and general evidence to be used. J. H. Townshend is in charge of this preliminary work and is receiving the hearty support not only of the governing board but also of every member of the association. Lumber interests are decidedly opposed to the advances and do not attempt to conceal the fact

that they are going to put up the most vigorous fight they have ever made before the Interstate Commerce Commission.

J. R. Walker, special attorney of the Southern Hardwood Traffic Association, was in Memphis last week going over a number of matters with the officials of that body, including the two cases already discussed. Mr. Walker wants to familiarize himself with the strong points to be made by the lumbermen and also with the evidence which the latter will submit. He will represent the association before the commission and he wants to begin his preparation in plenty of time to be thoroughly ready when these cases are called.

Mr. Walker said that he appeared before the commission on October 15 to argue in favor of the plaintiffs in the cases of the Bellgrade Lumber Company et al and the Anderson-Tully Company et al vs. the Illinois Central and Yazoo & Mississippi Valley roads. Through these cases the lumbermen are seeking a reduction of one cent per hundred pounds in rates on hardwood lumber not only from Memphis to New Orleans but also from all points in Mississippi to the Crescent City. Without going into details regarding his argument, Mr. Walker said that the commission appeared very much impressed with the evidence submitted by him, and created the idea that the outlook was very bright for a favorable decision. Export business is affected by these rates and lumbermen are quite anxious to win.

J. H. Townshend of the Southern Hardwood Traffic Association is authority for the statement that hearings on the petitions filed in behalf of the Vandenberg-Stimson Lumber Company et al vs. the St. Louis, Iron Mountain & Southern Railroad and Nickey & Sons Company vs. the Louisville & Nashville Railroad, set for Memphis, October 28 and 29, have been postponed until some time in November. The exact date, he says, will be announced by the commission later. The first petition seeks lower rates on shipments of logs and bolts into Memphis from points on the defendant road. The second is for the purpose of securing a longer time in which to make reshipments under the milling-in-transit rules and of securing refunds on log shipments when a given amount of lumber has been reshipped, without regard to its character. The association is ready with its arguments whenever these cases are called.

The Southern Hardwood Traffic Association is in almost daily receipt of new tariffs issued by the railroads. The latter are going ahead with their policy of announcing higher rates to Ohio river crossings, but just as fast as the new sheets are received petitions are filed with the commission asking suspension of the higher rates until the cases can be argued on their merits. These new tariffs are made effective November 1 to November 15, but as the commission has suspended until January 28, 1915, all advances to Ohio river crossings previously announced, it is expected that those now being issued will be similarly treated by that body.

Increasing Revenues by Increasing the Commercial Load

The Lumbermen's Association of Chicago, representing some of the largest lumber shipping interests of the country, is, with the railroads actively promoting a co-operative campaign toward increasing revenues on lumber traffic by securing heavier loading per car.

Power and equipment of the railroads has been constantly increased in capacity and the 40,000 pound and 50,000 pound capacity cars in common use a few years ago are rapidly disappearing, being replaced by cars of 60,000 to 100,000 pounds capacity.

The lumbermen are co-operating with the carriers in keeping pace with this development by educating lumber shippers and users in the importance of heavier loading, recognizing that as the commercial load of each car is increased it decreases the dead-weight percentage of the total load,—thus increasing the operating efficiency of the carriers as to net returns on the traffic as well as conserving car supply in times of shortage.

That the efforts of the lumbermen are bearing fruit is manifested by the showing of some of the important lumber carrying lines. For instance, the Chicago & Eastern Illinois railroad reports an increase in average loading, lumber traffic, from 22.9 tons per car in 1910 to 24.5 tons per car in 1914,—an average increase of 3,200 pounds per car or 7 per cent.

As the minimums in the tariffs naming rates on lumber have not been increased, the improvement in the average loading must be credited to the co-operation of the lumbermen in encouraging the filling of orders so that large cars may be loaded more nearly to carrying capacity.

Chicago Lumbermen's Club Holds Stag

The opening entertainment of the Lumbermen's Club of Chicago took place on Saturday evening, October 24, at the club rooms in the Great Northern hotel. As usual the entertainment committee had prepared a most pleasing program, which consisted of the following numbers:

BAKER SISTERS, Character Change Novelty Dancers and Songsters.	The Talkative Trickster.
ALBER THOLLY, Barytone and Singing Comedian.	PEARL VICTORIA, The Ragtime Girl.
ALMA ADAIR, The Girl from New York.	ROSS AND KING, The Versatile Stag Entertainers.
MISS ANITA LINK, The Dainty Soubrette.	WALTER DELLERS, Pianist.
STEVE JUHASZ,	MISS HILDABRAND, The Lively Girl at the Piano.

There was a very gratifying attendance which gives the committee hope that there will be a more receptive spirit for these entertainments than has heretofore been the case.

With the Trade

Penrod Sales Offices Established at Kansas City

The Penrod-Jurden-McCowan Lumber Company of Kansas City, Mo., and Brasfield, Ark., announces that effective October 1, the sales offices of the company are located in Kansas City and requests that all correspondence be addressed to that office. This change in its selling arrangements is made necessary by reason of the company's having replaced its former band mills at Brasfield, which were recently destroyed by fire, with a newer and more modern plant of very much larger capacity, requiring a more extensive organization than formerly to handle its greatly increased output.

The company believes that with this extension of its organization it will be able to earn a greater patronage from the consuming trade.

Nashville Hardwood Flooring Company to Establish Chicago Office and Warehouse

To better serve the increasing number of users of the Acorn brand of oak flooring manufactured by the Nashville Hardwood Flooring Company, Nashville, Tenn., that company has established at Western avenue and Fifteenth place, Chicago, a warehouse for the storage of a half million feet of flooring. The quarters are steam heated, damp-proof and every facility is offered for careful and expeditious handling of customers' orders.

No stock will be sold to the consuming or contracting trade, but the new warehouse will be for the benefit of the Chicago dealers buying in wagon lots or those who wish to use the warehouse for their flooring requirements in preference to carrying oak flooring in stock. In addition less than carload lot shipments will be handled largely by package car service to dealers in territory contiguous to Chicago.

In the same connection John B. Ransom & Co., of which concern the Nashville Hardwood Flooring Company is an affiliated company, will have a Chicago office at the same quarters for the furtherance of its interests in this territory. The affairs of both companies will be in charge of Earl Bartholomew, who for several years has been associated with the Ransom interests, and who enjoys a large personal acquaintance with the consuming hardwood and oak flooring trades.

The wisdom of the policy of the late John B. Ransom of supplying at a fair price the best oak flooring that can be produced has been fully exemplified by the increased yearly production of the Acorn brand of oak flooring and its increasing host of friends in the trade. This policy is being carried along conscientiously by the present members of the Ransom interests.

Buys West Virginia Timber Land

It is announced that a tract of 40,000 acres of stumpage in Nicholas and Fayette counties in West Virginia has been bought by the Meadow River Lumber Company of Cincinnati, O. More timber will be purchased by the company as it is required. It will erect a sawmill and build a railroad into the tract purchased. It is more than likely that the Meadow River company will lay out and build in the near future an up-to-date sawmill town in that vicinity.

To Establish Hardwood Plant

It is reported from Hazelhurst, Miss., that J. D. Flanagan and business associates of Grand Rapids, Mich., will establish a hardwood plant at that point. It is further reported that the associations have leased the site and equipment of the Hazelhurst Lumber Company and new machinery and equipment will shortly be installed.

New Michigan Furniture Factory

The Kelley Chair Company of Grand Rapids, Mich., is erecting a factory at West Hancock, that state, which will be eighty feet long, thirty wide, and two stories high. The machinery to equip the plant will be shipped from the company's factory at Grand Rapids. The factory will have a working force of thirty men at the start, and it is expected to be in operation within two months. William A. Kelley is president. He has had thirty years of experience in the furniture business.

Lumber Burned by Bombardment

The lumber yard of Legrand Brothers, at Rheims, France, was caught in the German bombardment on September 6, and more than \$200,000 worth of lumber was burned. Doubtless many a good stick of American origin went up in smoke. There should be consolation in the fact that there is plenty in this country with which to replenish the stocks destroyed in war.

Lumberman a Cavalry Officer

A. Couspeire, a New Orleans timber exporter, is serving as a cavalry captain with the armies of France. A letter from his French office gives his address as Capitaine Couspeire, Etat-majors, Depots d'Remounte a Alencon, Aine, which means, freely translated, that he was then attached to the headquarters of the Remount depots at Alencon, in the department of Aine.

The Largest Redwood Tree

B. F. Porter, a timber and lumber operator of Eureka, California, says he is about to fell a redwood tree on his tract that will equal the record value of any yet cut in California. It is 380 feet high, 26 feet in diameter 7 feet from the ground, 261 feet to the first limb, where the diameter is 11 feet, and scales over 344,000 feet of lumber. Fifty percent will sell at \$35, 30 percent at \$18, and the remaining refuse at \$8. The total value is estimated at more than \$9,000.

S. B. Vrooman On Foreign Trade Committee

Never in the history of Philadelphia has there been such a notable gathering of prominent bankers and merchants from every branch of industry as seen in the recent meetings held in this city for the purpose of expanding American trade, and on the basis of reciprocity the opening up of our markets to the Latin-American states and the South African countries. Every phase of the conditions prevailing in these new fields is being carefully investigated by men of keen judgment and men who have already had business experience in these fields. It is eminently satisfactory to the lumber trade to learn that Samuel B. Vrooman, senior member of Samuel B. Vrooman & Co., Limited, well known importers and exporters of mahogany, walnut, veneers and fancy woods, has been appointed to represent the lumber industries on this committee, as they realize that no one better fitted to bring about good results could have been selected. Mr. Vrooman stands conspicuously in the front rank as a man of the highest integrity and business probity. His many visits to foreign markets both as a buyer and seller of woods has given him a broad and valuable experience as to what measures to apply to gain business in these fields, and with this equipment he cannot fail to be of great service to the new trade seekers. It is safe to assume that this body of merchants and financiers will leave no stone unturned for the development of plans to bring about the desirable trade exchange between our markets in the North and those of the South American countries.

E. W. BARTHOLOMEW OF NASHVILLE LOCATES IN CHICAGO

Louisiana to Chicago by Water

The first shipment of lumber from Louisiana to Chicago by water arrived at its destination October 13. There were sixty carloads of oak from Jeffris, La., and the shipment was made by D. K. Jeffris & Co. Water transportation cut the freight bill twenty-five per cent. The lumber was towed on barges by a river steamer and was delivered at La Salle, Ill., where it was transferred to small steel barges of fifty tons capacity, or from 20,000 to 25,000 feet of lumber per barge. The transfer was due to the fact that the large barges which brought the lumber up the Mississippi river could not be passed through the canal locks. The small barges were taken through the Illinois and Michigan canal, thence through the drainage canal to Chicago. The company proposes to make all its lumber shipments from Jeffris to Chicago by that route. The time is a little longer than by rail, but the saving in freight justifies it.

Dyes from Stumps

The American Wood Products Company, Spokane, Wash., which is manufacturing a variety of dyes from products of pine stumps, announces that these dyes will be suitable for some branches of the textile industry. In the present condition of the dyestuff market, due to the lack of material heretofore obtained from Germany, the declaration by the above chemists comes as a great relief to the textile trade of Philadelphia, as this city is known as the most extensive textile manufacturing center in the United States.

Poor Economy

A veritable riddle, especially at a time when the cost of living appears to be the vital topic for consideration and a most careful economy becomes necessary in the matter of house building, has been puzzling J. Elmer Troth of the J. S. Kent Company, Philadelphia. Among the company's recent shipments Mr. Troth states are notable: "Two carloads of 6x24" sawed cypress shingles, made in South Carolina, to a point in the Province of Quebec; a lot of 5x24" sawed cedar shingles, made in the state of New Jersey, to a point in Maine, and another lot of 6x24" sawed cypress shingles to a point in northern New York state; it also has an order to ship some yellow pine rift flooring from Alabama, to a point in the state of Washington.

Now, notwithstanding these are orders bringing a fine margin of profit, Mr. Troth is non-plussed over the dimension of those shingle orders which on the face would appear as most eccentric if not truly freak orders, as the standard shingle used in Canada, in Malac and in northern New York state, is the 16" cedar shingle, although they deviate sometimes on white pine shingles; and, why the rift grain fir flooring that is produced very largely in the state of Washington and Oregon, could not be used in place of yellow pine rift flooring is a poser to Mr. Troth the shipper. He is inclined to think, as a conjecture of course, that all this material has been bought to comply with the arbitrary specifications by some inconsiderate architect, who is determined to have what he especially wants, no matter what the extra cost to the owners of the buildings. As to the flooring order, it seems to be a real case of "sending coal to New Castle."

Pertinent Information

New Orleans Exporters More Hopeful

A new phase of the export situation has recently developed as a result of the exigencies of war. It is reported in New Orleans on good authority that the French government is in the market for 10,000,000 oak ties of extra large dimension, to be delivered at the rate of 1,000,000 annually for a period of ten years. Whether this report materializes, and contracts are awarded, it is known that a number of exporters in New York and New Orleans, as well as interior mills, are figuring on this order.

It seems that the Germans tore up all of the French tracks as they retired from their advance into the interior of France, and it is presumed that the ties are required by the French government for the purpose of relaying these tracks. The requisition of oak indicates that the French government desires to make a permanent and enduring construction.

Heretofore oak has been cut out of Russia for this purpose, and the demand for American wood from this source is unusual. Communication between Russia and the remainder of the continent of Europe has been cut off, and the buyers are willing to pay almost any price for what they want, it is said. Freight rates do not figure in the negotiations for the reason that the French as well as the British lines are subject to impressment for transportation of foodstuffs or anything else required for war.

When it is remembered that the standing armies of France and England have been increased to millions of men, and that these men must not only be supplied with foodstuffs, with wheat for their bread and corn and oats for their horses, but with equipment for such war equipment as auto trucks, boxes for munitions and even gun-stocks, it will be seen that this creates an enormous demand for oak, ash and other hardwoods.

That this demand has already reached the tanners is indicated by the fact that the manufacturers have been called upon to supply 30,000 sets of harness and 60,000 horse collars within the past month. Milwaukee tanners have orders for leather for 4,000,000 pairs of shoes. The hardwood market has been slower to feel the effect of this demand for the reason that the stocks abroad were large at the outbreak of war, and weeks were required for their depletion. However, European government buyers have been in the American markets for trucks and other manufactured products for the past month.

Aside from this demand for military purposes there has been a small movement to Liverpool and London for building purposes. No ship will accept a consignment to the east coast of England, even though amply protected by insurance, because of the mines that make it a hazardous venture in the North Sea.

Scores of vessels have cleared from New Orleans during the past week, and while the New Orleans exporters have profited very little from the large movement of grain because the European buyers have gone direct to the interior markets, this movement has had a salutary effect on the lumber market as a whole. Hardwoods as well as yellow pine and cypress are firmer than they have been for a month. There is likely to be a slight advance in pine prices, sufficient to offset the slump of fifty or seventy-five cents a thousand wholesale three weeks ago. This strengthening may also be attributed to the widespread curtailment of the mills throughout this section. It is estimated that the production has been reduced from forty to fifty per cent, and even yellow pine stocks are reported to be low throughout the country, so that there is no justifiable foundation for a further slump in pine. Cypress, which was in a better condition to withstand the assault of adversity than pine, is inclined to be sympathetic, particularly certain grades, and any improvement in the pine market is likely to be reflected by cypress.

An Unusual Contingency

A question whether a chartered railroad can suspend operations at will will probably be brought before the Michigan Railway Commission soon by J. O. Moen of the Wisconsin Veneer Company, Rhinocler, Wis., operator of a veneer mill. Mr. Moen is cutting timber in Keweenaw county, Michigan. The only railroad in that county, the Keweenaw Cen-

tral is to suspend operations on November 1 because of lack of business in the winter months. Mr. Moen needs a road to get his timber out and says that if the railroad company insists on shutting down, he will take the matter before the state railroad commission.

Final Decision on Lumber Rates from Arkansas and Other States North of St. Louis

The announcement of the decision by the Interstate Commerce Commission on October 22 regarding the establishment for division of rates on lumber and other forest products from points in Arkansas and other states to Iowa, Minnesota and states north of St. Louis, closes the case which has been in progress since 1904. Lumber companies directly interested are: W. T. Ferguson Lumber Company, Chickasaw Cooperaage Company, Henry Wrape, Mt. Olive Stave Company, R. M. Fletcher Stave Company, Hampton Stave Company, Wilson & Wrape Stave Company, Ozark Cooperaage and Lumber Company.

Interesting Traffic Disputes

A protest of more than usual interest, filed by the Lamb-Fish Lumber Company of Charleston, Miss., is being considered by the Interstate Commerce Commission. Many interesting points in regard to the hardwood industry in Memphis territory are brought out.

Charleston, where the plant and yards of the company are situated, is on a branch of the Yazoo & Mississippi Valley Railroad, 100 miles south of Memphis. Despite the fact that Charleston is nearer gulf ports than is Memphis, it is necessary to pay a higher rate. The Lamb-Fish company makes a strong case, asking that it be allowed the right to have the advantage of its geographical position in competition with Memphis dealers, who, under present conditions, have the advantage of six cents a hundred on freight rates.

Attention is called in the complaint to a single shipment of thirty cars of gum lumber made to Alexandria, Egypt, via Pensacola. Owing to the inability to dispose of this wood at home the company went to great expense in working up foreign demand for it. Gum especially was little known abroad at the time. After all this effort and expense in extending American markets, the benefits of which go to all dealers, the Lamb-Fish company objects to being hampered by the transportation companies, whose interests have been aided so decidedly by the company's activities.

In speaking of the business of the company, it is stated in the complaint that the company handles 40,000,000 feet of hardwood lumber per annum. Its yard stock totals 19,000,000 feet and practically any sized order known to the hardwood trade can be filled, it is said. Memphis is the largest hardwood center in the country, yet the shipments from Charleston totaled more than twelve per cent of the shipments from all Memphis dealers combined and over twenty per cent of the business handled by the Yazoo & Mississippi Valley from Memphis lumber manufacturers and dealers.

One of the features of the Lamb-Fish complaint is the charge that ocean freight rates from New Orleans apparently are dominated and under the control of some central power. "Seldom indeed is there any variation in the quotations made by different steamship lines or steamship agents. In rare cases a slight concession may be made on account of distress room," the complaint reads.

Without considering the time since the outbreak of the war in Europe the business of the Lamb-Fish company is shown to have increased steadily and continuously. To meet strong competition in the Mississippi valley it is shown to be very necessary that the complainants have all the gulf ports open to them on the same basis as to their competitors. Memphis dealers are not called upon to pay terminal charges at New Orleans, it is shown in this connection. The Lamb-Fish company also wants to take advantage of the pine charters which sail from Pensacola, Mobile and Gulfport that frequently can take care of large parcels of hardwood at rates which are in many cases one-half of those of the established lines at New Orleans.

Due to the rates which are alleged to be unjust, competitors of the Lamb-Fish company are given an advantage of \$2 a thousand on gum and \$3.50 on oak. The charges that are being collected from Charleston are thought to violate the act to regulate commerce. The company also asks for a refund on all overcharges. In addition to the Yazoo & Mississippi Valley the Gulf & Ship Island and the Louisville & Nashville railroads are made parties to the suit.

Pending further investigation the Interstate Commerce Commission has authorized the Gulf & Ship Island Railroad to establish a rate of twelve cents on imported mahogany logs from Gulfport to Memphis. This applies only on carloads. The minimum weight is fixed at 35,000 pounds.

Arguments in the case arising from the proposed increase in the rates on hardwood lumber and articles manufactured therefrom from points in Louisiana and Arkansas and other points to Memphis and other destinations were heard October 21 by the Interstate Commerce Commission.

Complaints arising from alleged unjust and unreasonable rates have been filed with the Interstate Commerce Commission recently by the Atlantic Lumber Company, of Boston; Eastern Oregon Lumber Producers' Association and National Wholesale Lumber Dealers' Association.

A favorable report has been made to the Senate of the so-called Aswell land bill by the committee on public lands. A number of lumber companies in northern Louisiana are vitally interested in this legislation. Possession of much valuable hardwood land is being disputed by those claiming to be settlers. In their argument the attorneys for the lumber companies pointed out that the so-called settlers all claimed virgin timber lands as their homes. The only lumberman appearing in the interest of the settlers was Henry Hardtner of Urania, La. There is no probability that the bill will be reached at this session of Congress.

Correspondence with the Interstate Commerce Commission discloses the fact that the New Orleans and Great Northern Railroad is requiring lumber companies operating along its line to equip their logging cars with air brakes, hand brakes, grab irons and steps. This has met with objection on the part of some of the companies, particularly with the Salmen Brick and Lumber Company. The Salmen company has installed air brakes, but says that it would be useless to fit logging cars with hand brakes and steps that would be knocked off daily.

Railroad tariffs increasing rates on lumber and other forest products from southern producing points to St. Louis and Ohio river crossings have been suspended by the Interstate Commerce Commission until January 28, 1915.

Cold Storage Fish Records

Believing implicitly in the value of the methodical handling of records, and in the hope that those of our lumbermen friends who are keen followers of the finny tribe may be benefited, *HARDWOOD RECORD* has caused to be prepared, with the co-operation of L. J. Pomeroy, the brilliant young partner of Gus Landeck, and manager of the Chicago interests of the Landeck Lumber Company, the accompanying form, which will materially assist in the tabulation of fish "dope." The main purpose of this card is to furnish lumbermen-fishermen with some means of definitely and incontrovertibly tabulating records of catches in order that "unquillible" friends may have no possible chance of refuting tales of marvelous successes in raids on the denizens of the northern lakes.

If any other readers feel that this little suggestion will be of benefit to them, *HARDWOOD RECORD* is prepared to send out to its "reel" friends as many of these cards as may be necessary to cover each season's activities.

Wood Imports and Exports

The imports and exports of logs, lumber, and other forest products for August, 1914, are given in the following summary from official figures of the foreign commerce of the United States.

Imports, toys from Germany, \$809,400, from other countries, \$102,488. Cabinet woods, including mahogany, \$355,721. Of this, \$15,425 was the value of mahogany from Africa. Lumber from various countries was valued at \$2,062,528, and the imported wood pulp was worth \$1,575,223.

The exports of sawed and hewed timbers were valued at \$305,982, and lumber \$2,452,429. Exported furniture was worth \$250,818, and agricultural implements \$193.

Baltimore Exports, While Meagre, Have Encouraging Tone

The statement of exports from Baltimore for September shows a decided slump as compared with the corresponding month for 1913, and plainly indicates the effect of the war upon the trade. While August was a dull month, having been affected by the great conflict, the curtailment in the foreign forwardings in September was far greater, the value of the shipments being only a small proportion of September, 1913. All items on the list underwent a reduction. No logs at all were shipped, while the exports of oak lumber dropped from 1,563,000 feet in September, 1913, to 313,000 feet last month. Of spruce there passed out of this port last month not more than \$6,000 feet against 2,600,000 feet in 1913. The shipments of staves amounted to 4,142, valued at \$625,

against 21,363, worth \$1,930. Under the classification of "all other manufactures of lumber" a value of not more than \$757 is recorded against \$3,600 for the same month last year, while the value of furniture was \$1,800 against \$2,675, and of "all other manufactures of wood" \$4,274 and \$30,610. The total for the month was \$27,155 against \$207,294. Poplar did not figure at all in last month's foreign business. Unsatisfactory as the exhibit appears to be, it offers some encouragement, showing that in spite of most formidable obstacles the business did not come to a complete stop. What is even more gratifying is the fact that the current month has shown a very fair proportion of gain in the shipments over September. Poplar has been once more going forward, and there are other indications of a recovery, due for one thing to the fact that the vessels of the Allies encounter hardly any interference, but even more to the circumstance that stocks in the United Kingdom have run very low, and that a replenishing has become imperative. There is every indication that the foreign shipments will before long attain moderately large proportions, and that the special requirements of the various countries may even cause briskness in the trade. An increasing demand for heavy timbers is reported from England, and the prices offered are said to be, if not exactly attractive, at least sufficiently remunerative to arouse the interest of the exporters.

Canadian Souvenirs

The *London Timber News* says that Canada is making a splendid gift of flour to the mother country. It has been decided that the sacks, when empty, should be sold as souvenirs at five shillings each. Two-thirds of this sum will be devoted to the Prince of Wales' National Relief Fund, and one-third to the Belgian Refugees Fund. The sacks are all marked "Canada's Gift." Applications for the sacks as souvenirs, accompanied by a remittance of 5 shillings, should be sent to the Hon. Secretaries, National Relief Fund, York House, St. James's Palace, London, S. W.

Car Statistics

The American Railway Association bulletin dated October 22 gives as a total surplus of freight cars on October 15, 154,342. This compares unfavorably with the surplus on October 1, which was 133,382. The surplus on October 15 a year ago were 37,198, and the prior maximum record for total surplus was on October 14, 1908, when there was a total of 115,936 cars. It is gratifying to note, however, that almost one-half of the surplus increase is in coal cars. This class of equipment increases generally in all sections except New England and the Southwest, where there is a slight decrease.

Surplus box cars show a large increase in the Northwest and lesser increases in the eastern states, the Central Freight Association territory and Canadian roads. There is also a considerable increase in surplus of miscellaneous cars in the Northwest.

The total shortages remained practically unchanged. The shortage on October 15 was 2,360 cars, and on October 1, 2,355 cars.

Plans to Manufacture Wooden Toys in England

Efforts are being made to prepare for the manufacture in England of wooden toys and small woodenware, which before the war came almost exclusively from Germany. It is noted that vast quantities of waste material are burned in England, and that with a judicious outlay this might be turned into practical articles of commerce, and that most of these goods can be made wholly or partially by machinery.

It is suggested that an organization to attempt to manufacture samples of such articles be sent to English cottagers with a view to encouraging them to enter into the manufacture of wooden toys and to collect and distribute to retailers the finished article so as to secure the establishment of a useful rural industry.

The Gate City of the Sunny South

The above is the title of an attractive little pamphlet written by Adolph M. Schwarz, a prominent New York lawyer, setting forth his first impressions of Atlanta, Ga. According to the tone of the booklet Mr. Schwarz must certainly have been agreeably impressed with the scene.

RESULTS OF THE BUY-A-BALE MOVEMENT

parity and general aspect of that flourishing southern city. The opening paragraph describes his first impressions very aptly. It reads as follows:

"Atlanta's unprecedented growth; Atlanta's congested downtown traffic; Atlanta's sunny days and balmy evenings; Atlanta's inimitable geniality, sincere and hearty welcome to strangers coupled with the particularly characteristic Atlanta spirit can neither be described or defined. One must needs see it to feel it."

He goes on to describe his impression of Atlanta as a city telling of various points of interest and comparing them with similar points in other large cities. He describes the hotels, the banks, the skyscrapers, the shopping facilities, etc., and then goes on with a detailed account of the numerous amusements and social features, such as clubs, etc.

The booklet closes with a pleasing summary of the plans and ambitions of the energetic citizens of that busy community.

Germany and Austria's Furniture Export

In 1912, which is the date of the latest available statistics, Germany exported furniture of the value of \$3,429,500 and Austria's was worth \$5,480,000. Russia was Germany's best customer for these goods, and Roumania and Argentina took most of Austria's exports. Russia and Argentina are now closed as markets for furniture made in Germany and Austria. Probably no large amount of American furniture will be sent to Roumania and Russia, but many other markets should be open to us. The buyers of furniture will, in most cases, continue to buy.

A Perpetual Menace

Fires are a perpetual menace and are so common that little attention is given them except when the publication of figures puts the facts squarely up to the people. Property throughout the United States and Canada, representing a total value of \$176,706,750, went up in smoke during the nine months which ended September 30. This total compares with \$178,456,550 for the same period last year, and \$177,520,650 in the first nine months of 1912.

Fire losses last month, according to figures compiled by the New York Journal of Commerce, were \$14,383,050, as against \$17,919,300 for September, 1913. There were 218 fires last month which caused, in each instance, a property loss of \$10,000 or more.

Risk in Shipping Contraband Goods

The Department of State at Washington has defined the rights of shippers in this country who wish to sell to the nations at war. They may sell to whom they please and ship where they please, whatever they please, and they incur no penalty in doing so, except that if they ship contraband goods and they are captured by an enemy, this shipper loses without redress, except what the insurance companies afford. He is in danger of no other punishment. The United States government would violate its neutrality if it were to ship contraband material to a belligerent, but that does not apply when the shipping is done by an individual. This is an instance where the citizen has more liberty of action than the government. There is little danger at the present time of shipments to the allies falling into enemies' hands.

Too Much Standardization

At the present time when the tendency is toward standardization, it is interesting to note a complaint in England of too much standardization along a certain line. The war has called for large numbers of huts for housing the troops. The London Timber Trades' Journal says that these buildings appear to be erected according to standardized plans, with the result that one building in construction is like another as the two proverbial peas. From a military standpoint no doubt the adoption of building plans of a stereotyped design has its merits, such as uniformity of accommodation, easy allotment to troops, etc. On the other hand, when it comes to a question of the necessary materials, the duplication at short notice, upon a scale hitherto unattempted, of single pattern buildings involves the timber trade in awkward problems and the government, it may be suggested, in unnecessary expense. What does not appear to be fully realized by the authorities is that there is no similarity in the conditions governing the production of a natural commodity like timber, and of manufactured goods such as girders or iron sheets. When buildings are being erected all over the country to standard designs it is obvious that there will be a continual repetition of certain few lengths and sizes. These then become in general demand, and it is impossible to avoid prices rising. Even if enough timber of the particular section is available, the perpetual repetition of a particular length is only met by cross cutting to waste.

More variety in design is recommended in these buildings, particularly in the sizes of the dimension stock required. If that is done, there will be less trouble in procuring the material, and less delay in completing the work.

The Fortunate Gray Horse

Writing nearly two thousand years ago, a prophet described a vision, thus: "Lo, death appeared on a pale horse and hell followed with him."

The European buyers who have come to the United States to procure horses for cavalry in the armies, are taking no chances with "pale" horses. They will not buy a gray. A horse of that color is too conspicuous. When he appears on the horizon, the enemy's artilleries get the range at once, and in a minute or two the prophet's words are verified, for hell follows close on his heels until he gets out of sight, if he is

fortunate enough to get away. So, the order has gone forth to take no gray horses for cavalry.

It is a question, however, whether the gray horses left behind in this country are fortunate or otherwise. They will have the loads to pull in cities, on farms, and in lumber camps. While the bays are battling in Europe, the grays will be hauling crossties in Arkansas or pulling stumps in Michigan.

Birch Bark Souvenir

A resident of Winnipeg, who is one of the pioneers of the West, recently received an interesting souvenir of his first trip to western Canada. While on his way to the Red River settlement in 1870, his party was crossing the marsh known as the Dismal Swamp when he became possessed of a desire to write home. He accordingly stripped some bark from a birch tree and wrote several pages, letter size, which were despatched at the first opportunity to his mother at Belleville, Ontario. His mother having recently died, the letter was discovered among her treasured mementoes and sent to Winnipeg. The writing is as clear as on the day it was written, forty-four years ago, though the bark has grown tender with age.

American Woods in Venice

A recent consular report from Venice states that pitch pine is popular and much used there, competing with larch from the Austrian and Italian mountains. American oak is used to some extent, limited by its cost. Red gum has been known but a few years, but is appreciated for its smoothness and ease of working, although its liability to warp is objectionable.

Restricted Logging in North

Winter logging operations in Michigan hardwood tracts will not compare with operations in other seasons when the market has been stronger. However, reports indicate that there will be a fair logging in some parts of the state. While it is anticipated that operations in the northern part of the lower peninsula will be somewhat restricted, a goodly number of camps will operate in the upper peninsula in which are located many of the finest virgin tracts. Several contractors who will cut from 1,000,000 to 6,000,000 or more feet of hardwood have already started their camps.

There will be a great quantity of hardwood cut in camps which will get out pulpwood and cedar products, for which there is a good strong demand and upon which many camps will center their work. It is necessary to cut some hardwood and when owners are logging the lands they will cut all hardwood necessary to get other products rather than go over the land twice. Several companies announce their intention of holding the hardwood logs just as they are cut and drawn from the woods until the market improves.

Wooden Steering Wheel Rims

The wooden rim is the ideal one for steering wheels, according to *The Handle Trade*, and it is not only common on automobile and motor trucks but it is being found in use on motor boats and the volume of demand seems to be large enough to make it an interesting item, especially to those working in hickory and ash and those woods that will make rims.

Steering rims are made of various sizes ranging from eleven to eighteen inches inside diameter; some are bent and some are made of sawed segments fitted together. Whether bent or sawed the rims must be rounded off and finished, which calls for a special machine. One of the machines used for this work has two sets of jaws or chucks for gripping the rims while they are being shaped, one which grips the outside and holds and revolves it while the inside is being shaped and another set which grips the same rim on the inside while the outside is being shaped.

Steering rims can be made on frizzers or on regulation shaper heads but where one has a quantity of them to make it is better to use machines designed especially for this work just as one would use special machines for shaping bent handles.

Sawing Oak in England

It is customary among English mills which saw oak to keep the lumber from each log separate in the yards and kilns. The buyer thus gets the same grain and color, log by log, and can match his cabinet work. The same policy is followed in the United States when finely figured veneers are cut. The product of every log is kept to itself, because the figures match.

Keystone State Mousetraps

Manufacturers in Pennsylvania are shown by statistics to be the greatest makers of mousetraps in America. They make many kinds, but those partly of wood are of chief interest. A million and a half feet of lumber are required yearly to meet the demand for the little killing machines. One style garrotes the mouse by catching him by the throat with a wire loop, and holding him in a death grip until the last farthing of the penalty is paid; but another style gets in its work more quickly. A stout wire spring is held down by a baited trigger, and when the unsuspecting little varmint ventures up for a nibble, the released spring whales him across the back, and the deed is done.

The kinds of wood usually employed in the mousetrap business in Pennsylvania are beech, maple, yellow poplar, red gum, and white elm. Many other woods will answer as well, but the interesting point is the quantity. A train of seventy-five cars loaded with lumber looks like a

whole lot to go into mousetraps in a single state in one year, but that is the tale told by statistics.

It is claimed that each trap is good to catch 365 mice a year. Some do much better, but take that as a conservative average and figure results. It means the capture of 5,475,000 mice a year. The average length of a mouse, tail and all, is at least four inches. String these dead mice out, nose to tail, in a straight line, and the line would reach from the earth to the moon, with enough mice left over to reach four times round the earth at the equator, and a residue of mice remaining, stretched out, nose to tail, in a line four thousand miles long. This is astounding, but any one acquainted with Pittsburgh will not doubt it. Besides, the government collected the figures which show the amount of wood going into mousetraps, and that is the basis of the whole estimate.

Enormous Apple Wagons

Specializing goes to the extreme limit. At Martinsburg, W. Va., which is the center of a famous apple region, an enterprising vehicle manufacturer has put an apple wagon on the market, and it is said to be filling a long felt want. It carries a 24,000-pound load of fruit from the orchard to the railroad. That is from six to ten times the ordinary load of apples carried by farm wagons. Evidently the orchardists of that region are not in favor of too many trips, and prefer taking larger loads and fewer of them. They are favored by a nearly level country and the finest limestone roads in the world. That region lies in the famous valley of Virginia which was so completely devastated during the Civil war that it was said "a crow flying over must carry its knapsack with it, if it expects to eat anything on the way." The apple wagons are made by the Auburn Wagon Company, Martinsburg, W. Va.

Wage Regulations in Mexico

There is small likelihood that American workmen will be tempted to leave jobs on this side of the line in hope of bettering their condition in Mexico.

A decree under date of September 15, 1914, by Governor Eulalio Gutierrez, fixes the minimum wage in the state of San Luis Potosi at 21 cents, American money, per day, to be paid in cash. In mines the minimum wage is fixed at 35 cents, United States currency. The 9 hour day is also decreed. Employers who have been paying more than the minimum are forbidden to reduce wages to the minimum. Workers on farms must be supplied free water, wood, and shelter. By the same decree company stores are abolished. All debts contracted by laborers to employers expire by limitation in one year. Employers are prohibited from placing any obstacle in the way of laborers who desire to change their place of employment or to accept other employment. The wages of laborers are exempted from garnishment.

Probably the most important article of the decree provides that in view of the exceedingly low wages heretofore prevailing all loans and advances heretofore made and now outstanding against the laborers, must be considered as a voluntary supplement to the inadequate wages and are therefore declared liquidated and canceled.

Woodworking Machinery Markets

The London *Timber Trades Journal* advises British manufacturers to get busy and capture the woodworking machinery markets which the Germans have relinquished under stress of circumstances. If any markets are to change hands, the United States manufacturers will doubtless be on the ground to profit by the redistribution.

The empire of Russia also offers an unlimited market for woodworking machinery, and the demand in that country after the war will be unprecedentedly great. With the exception of a few American, Swedish, and Norwegian machines, the trade hitherto done in that vast field has been by German firms. A good opportunity presents itself for well-known American makers to push their trade by opening show-rooms and offices at Petrograd, Moscow, and other centers, employing capable Russian travelers, and making arrangements to modify and adapt their terms to the customary conditions of Russian trading.

The South American market is also another sphere in which the German manufacturers have not been slow to push their goods. Enterprize on the part of American manufacturers should open up an extended sale among the Spanish-speaking people in that vast quarter of the world.

City and Country School Children

Primary schools and the lumber business may not appear to be closely enough connected to justify a discussion of such schools in a lumber journal; yet there are some points of contact. Whether the lumberman works in the woods and lives in the country, or sells lumber at the yard, or converts it in a factory, and lives in the city, if he is a man of family he is interested in the welfare of his children while they are passing through their first years at school. He not only pays taxes to help support the schools, but he should be and usually is interested in neighborhood betterment.

A recent number of the West Virginia School Journal discussed the comparative health of country and city school children. Statistics from various state and national commissions, committees, and investigators were quoted as authority for interesting and somewhat astounding statements. It will prove a surprise to most persons to learn that the country school child is from fifteen to twenty per cent more defective physically and mentally than the city child.

In Pennsylvania a study of 1,831 rural school districts was contrasted

with a similar study of the health of the school children in Harrisburg, Pittsburgh, and Altoona. The percentage of defective children in Altoona was 69, in Pittsburgh 72.2, while in the rural districts studied, the aggregate of defective children studied was 75 per cent. This means that three-fourths of the 294,427 country school children in Pennsylvania are in need of special care and treatment, while even in New York City only 72 per cent of the children are at all defective.

The investigation of specific defects gives the same results. For instance, a comparison of the school children of Orange county, Va., with those of New York shows that with all the dangerous surroundings and disadvantages of city life, the number of New York school children with lung trouble amounts to less than one per cent, while 3.7 of all the school children in Orange county, Virginia, suffer from some affection of the lungs.

When the nutrition of rural school children was considered, it was supposed that here, of course, the country child would greatly surpass the child in the city, yet such was not found to be the case. The same startling results are found when figures for mental defectives are compared. Statistics from twenty-five cities, and from rural districts in Pennsylvania, Massachusetts, New Jersey, Idaho and Virginia were compared, showing that the average of mental defects among city children was 0.2 per cent, while the average among rural school children was 0.8 per cent. Heart disease is twice as prevalent among country children as among city school children. City school children have only 0.13 per cent of curvature of the spine, while rural school children have 3.5 per cent. Ear troubles are five times and eye troubles are four times as frequent among country children. Adenoids are found in city school children 8.5 per cent, but in the country the percentage is 21.5. The children in twenty-five cities showed an average percentage of enlarged tonsils of 8.8, while a similar number of country children showed over 30 per cent, and in Idaho the percentage ran up to 43.9.

It was found that even in the slums of cities, where the pinch of poverty is the sharpest, the food is better prepared than it is in the country, while the distance from dentists, oculists and clinical advantages accounts for the large number of defects in sight, hearing and teeth. Country houses are often drafty and overheated. The chances for house infection are greater and children are more exposed to cold, heat and dampness. The school houses are often old and carelessly built and have insufficient equipment. In seven states there is no regulation of the sanitation of country schools. Heating is generally by means of a stove, and bad ventilation is usually the result. Seating accommodations are bad and general sanitary conditions often unspeakable. Frequently the only provisions for cleanliness are a pail of water, a dirty basin and a common towel. Drinking arrangements are bad and drinking water often contaminated. Now take into consideration the many other contingencies which the country child has to meet—physical labor, chores before he starts for school in the morning, a badly assorted breakfast, a long walk over bad roads—then subject him to infection, to bad water, and it is no wonder that he falls prey to a dozen maladies more readily than the city child.

The result of this survey of rural schools cannot fail to shatter some of our previously conceived views regarding rural conditions, and at the same time point out the remedy.

Will Curtail Mahogany Cutting

It is stated in the London trade papers that African importers have, since the outbreak of hostilities, taken steps to stop cutting mahogany, and as steamers are not returning to the West Coast of Africa, it follows that there will be no boats to bring even available supplies forward. The holding of auction sales are determined by the sellers, and, as they believe conditions favor them, it follows that full advantage is likely to be taken of diminished supplies so as to advance prices.

Hardwood News Notes

< MISCELLANEOUS >

The Baby Table Company of Jamestown, N. Y., has recently been reorganized.

J. D. Pribble, Glasgow, W. Va., is planning the establishment of a veneer mill at that point.

The Central Cabinet Company has filed an application for a charter at Philadelphia, Pa.

The Booth Manufacturing Company of Howard City, Mich., has filed a voluntary petition in bankruptcy.

The Kansas City Mill Work & Moulding Company of Kansas City, Mo., is reported to be out of business.

At Parkersburg, W. Va., the Parkersburg Handle Company is a new incorporation, its capital being \$10,000.

The Charleston Veneer Works has been incorporated at Charleston, W. Va., with a capital stock of \$15,000.

The Rhoda Lumber & Veneer Company has been incorporated at Rhoda, La., with an authorized capital of \$10,000.

The Brookston Box & Lumber Company has been incorporated at Brookston, Minn., with a capital of \$25,000.

At Owensboro, Ky., the Owensboro Chair Manufacturing Company has become involved in a voluntary petition in bankruptcy.

The Fletcher Savings & Trust Company has been appointed receiver for the Premier Motor Manufacturing Company, Indianapolis, Ind.

W. P. Ketcham, formerly of the Ketcham Lumber Company, Chicago, died on October 10 at Pasadena, Cal., at the residence of his daughter, Mrs. Edwin J. Bowes, Jr.

CHICAGO

M. L. Pease of the Galloway-Pease Company, Poplar Bluff, Mo., is spending several days in Chicago on one of his regular business trips.

Earl Bartholomew of John B. Ransom & Co., Nashville, Tenn., has been around the city for quite a little while, and while here the last time completed the arrangement for the establishment of a warehouse in which will be carried a regular stock of the famous Acorn brand of oak flooring manufactured by the Nashville Hardwood Flooring Company, one of the allied Ransom interests.

Henry A. Batchelor, Jr., president of the Tennessee Oak Flooring Company, Nashville, Tenn., passed through Chicago on October 12 with his family on his way to Saginaw, Mich.

William H. White of Boyne City, Mich., was one of the prominent northern visitors to the Chicago trade recently.

A. T. Goldsmith, general manager of the Radford-Portsmouth Veneer Company, Radford, Va., was in the city the greater part of last week.

J. D. Allen, manager of the veneer department of the Anderson-Tully Company, Memphis, Tenn., came to Chicago a few days ago and will be here for several days.

HARDWOOD RECORD has received from the Day Lumber & Coal Company, Clay City, Ky., a letter stating that the general offices of the company have been located at Jackson, Ky., since October 12.

NEW YORK

Schedules in bankruptcy of Gochnour & Sobie, hardwood wholesalers of 1 Madison avenue, show liabilities of \$8,500 and assets \$6,700.

Stultz Brothers, manufacturers of pianos, this city, have been petitioned into bankruptcy. Liabilities are said to be \$50,000. A. L. Bernstein has been appointed receiver.

Judge Mayer has confirmed a composition of Charles Koster, architectural woodworker, with creditors at fifty cents on the dollar, in notes at three and six months.

Real estate men from the entire state met in annual session in New York, October 16 and 17, to discuss present affairs in their field of endeavor. There was much informal testimony of the current quiet in real estate circles, though the outlook is viewed more favorably. Following adjournment of the sessions the visitors made a motor trip to Queens Borough as guests of the Queens Chamber of Commerce.

BUFFALO

Echoes are still coming in of the outing given by the Buffalo Lumber Exchange at North Boston, this county, on October 7. So enthusiastic is everybody that some of the dealers made a second trip and it is agreed as nearly as such things can be that they will all meet under the big chestnut tree next year. How much of an "old chestnut" the agreement will be by next October is hard to say, but it is not likely there will be as many actual chestnuts on the trees next year as there were this time. If F. M. Sullivan and his associate chefs in the hardwood trade, E. J. Sturm, C. A. Perrin and E. A. Nostrand, get up two better meals then than on this occasion they will have to take cooking lessons next winter.

The J. M. Briggs Lumber Company has been organized here to handle hardwoods and general lumber. It succeeds J. M. Briggs & Co. The office is on the ninth floor of the Ellicott Square. The company is incorporated with \$25,000 capital and the directors for the first year are J. M. Briggs, N. C. Eastman and H. C. Albee. Alfred Swanson is also connected with the company.

Taylor & Crate are giving much attention to forestry on their southern timberlands and are working out a careful system of looking after timber, of keeping out trespassers and of preventing and putting out fires.

J. B. Wall, president of the Buffalo Hardwood Lumber Company, has recently spent two weeks in Alabama, looking after the interests of the company. He also stopped at Memphis on business.

Blakeslee, Perrin & Darling state that the lumber trade is quiet, but that it is a little better than several weeks ago. Plain oak and maple are the leading woods.

The Yeager Lumber Company, Inc., states that there is no general improvement in the hardwood demand. The yard is selling more oak than anything else, with a small sale for poplar.

Davenport & Ridley are getting in some stocks of white ash, which is said to be in fair demand. B. F. Ridley recently returned from a trip to the mills in Pennsylvania.

The Hugh McLean Lumber Company is opening its mill at Birmingham, Ala., which will operate on oak and poplar. Trade is said to be slow in this territory at present.

Miller, Sturm & Miller say that the local demand for hardwoods has shown improvement lately, though business is not up to the usual average. Oak and maple are in chief demand.

Charles A. Cyphers, as president of the Buffalo Incubator Company, has filed a voluntary petition in bankruptcy. Indebtedness is \$48,177, while assets are stated as \$131,274.81. About \$100,000 of assets are tied up in real estate and insurance policies.

PHILADELPHIA

The W. J. Donnell Lumber Company, Perth Amboy, N. J., was incorporated under New Jersey laws October 5. Capital, \$120,000.

Judge Lloyd, in the circuit court of Camden, N. J., handed down a decision on October 7, against six fire insurance companies, ordering them to pay \$27,847.50 to Lewis Starr, receiver for Joseph Mick, a bankrupt lumber merchant of Laurel Springs, N. J. Mick's lumber yard was destroyed by fire on June 28, 1911, and a receiver appointed, but he was unable to meet obligations because of the refusal of the insurance companies to settle the claims, which amounted to \$30,000. The receiver says when the claims are settled the creditors will be paid dollar for dollar.

The New York Shipbuilding Company, Camden, N. J., has been agreeably awarded a contract to build one of the new dreadnaughts ordered by the government recently. The bid was \$7,195,000. This will mean continued activity in this yard for months to come.

The United States appellate court handed down a decree refusing to consider the appeal of the five convicted officers of the International Lumber & Development Company for a new trial. The last resort of this bunch is the United States supreme court, where this case may be heard on constitutional questions.

Robert C. Lippincott has removed from the Crozer building to 537 and 539 Land Title building. Nathan B. Gaskill and George E. Lippincott will be associated with the business.

Lumbermen's Exchange held its monthly meeting on October 8, at 4:30 P. M. President William H. Fritz in the chair. The small routine business was soon transacted, after which the members in waiting automobiles hid themselves to the Huntingdon Valley Country Club, on the York road, where they enjoyed a dinner par excellence. The evening was devoted to general amusements. A Mr. Kelly, resourceful in jokes and anecdotes, kept the boys in roars of laughter, and Edward F. Henson, Eli B. Hallowell, James L. Richardson, Frederick S. Inderhill, Paul P. Pearson, William B. McFarland, Jr., W. H. Wyatt and Ralph Souder, an octette of creditable musical efficiency, rendered some familiar selections in well simulated grand opera style. Horace A. Reeves, Jr., entertained the bunch with a very classic solo entitled, "When Towser was a little dog." The evening as an entertainment was a rousing success.

Al G. Flournoy, sales manager, and W. A. Ruddick, salesman for the Virginia & Rainy Lake Company, Virginia, Minn., were recent visitors to the exchange rooms. The E. P. Burton Lumber Company and the Ellwood Allen Lumber Company are on the boards for membership in the exchange.

PITTSBURGH

The Fayette Lumber Company of Uniontown, Pa., has secured a large tract of timber near Humbert, Somerset county, Pa., and is building a branch railroad into the tract. A considerable amount of good hardwood will be cut.

The Kendall Lumber Company of this city is considering building a plant near Cheat Haven, W. Va., to cost \$60,000. This is one of the largest manufacturers of hardwood timber in this district.

The Craig Lumber Company reports that there will be considerable good buying of hardwood on the part of window glass concerns following the settlement of the wage scale. Chestnut is pretty sure to share liberally in this trade.

The Salt Lick Lumber Company which maintains an office at 5033 Jenkins arcade in this city, is running its mill steadily on the Licking river in Kentucky. It has worked up a fine trade in its specialty, oak flooring, in this district and also has a big local trade in Kentucky and West Virginia in basswood.

The West Alexandria Lumber Company of West Alexandria, Ohio, has filed a petition in bankruptcy—liabilities, \$29,801.63; assets \$25,312.29. The Woodman Lumber Company of Cresson, Pa., also filed a petition in bankruptcy and the creditors will hold a meeting in Pittsburgh, October 29. The members of the concern are Harry W. and David E. Brown.

Two big plants have been located in the Pittsburgh district during the past week. The Pittsburgh Industrial Development Commission located at Carnegie, Pa., a steel company which will build a plant 700 feet long at once. At Vesta, Pa., twenty miles up the Monongahela river, the Williams Tire Company of Glassport, Pa., has bought ten acres and will build a \$300,000 plant.

The bond-holders of the Albite Coal & Lumber Company, a subsidiary of the Pittsburgh-Buffalo Company which went into the hands of a receiver last winter, held a meeting in Pittsburgh October 6. A favorable report was made concerning the property of the company in Kentucky. This concern's issue of bonds is \$500,000 of which only \$260,000 are outstanding.

C. J. Glass of Muncy, Pa., has bought a big tract of virgin timber in Brady township near Luthersburg, Pa., and will cut off about 1,000,000 feet of chestnut and hardwood as fast as possible.

Manager Brown of the hardwood department of the American Lumber & Manufacturing Company, paid a two weeks visit to Canada lately. He

found hardwood buyers greatly discouraged over the business outlook on account of the war.

G. C. Adams, sales manager of the Duquesne Lumber Company, reports business quiet. The company's eastern office is doing fairly well and its mill at Breamer, Tenn., is running steadily.

The Foreign Trade Commission organized lately through the efforts of the Pittsburgh Chamber of Commerce and the Pittsburgh Industrial Development Commission, called a meeting of 300 manufacturers of Pittsburgh at the Hotel Schenley, October 20, when further means to secure foreign orders for this district were considered. President J. Rodgers Flannery of the Commission will go to London in a few days to work up English business.

JAMES & ABBOT COMPANY
Lumber and Timber
 No. 165 Milk St., BOSTON, MASS.

**The Southern California Hardwood
 & Manufacturing Company,
 Los Angeles, California**

calls the attention of the trade to its

**"South Sea" Brand
 of Philippine Mahogany
 Directly Imported**

from a mill cutting the finest mahogany in the islands.

We were fortunate in securing a large cargo just after the war was declared and are able to offer this fine figured wood at prices much lower than other mahoganies.

Our SOUTH SEA MAHOGANY is rapidly increasing in favor wherever it has been tried. Especially fine for interior trim, show cases, fixtures, and furniture. Carload prices quoted and samples sent upon request.

Southern California Hardwood & Manufacturing Co.
 Los Angeles, California

AT HALF PRICE

AND LOADER COMBINED

Clyde Modern Equipment. Used about sixty days. Operations discontinued. No further use for it

For Particulars Write

GOGEBIC LUMBER CO.
 GRAND RAPIDS, MICH.

The Petersens of Jamestown, N. Y., have bought the Port Allegany Furniture Company at Port Allegany, Pa., and are equipping the plant with up-to-date machinery. They will manufacture pedestals and will have the plant running in full in a short time.

< BALTIMORE >

The executive committee of the Interstate Association of Mantel and Tile Dealers is scheduled to meet in Baltimore November 12 and 13, to make arrangements for the national convention of the organization, which will be held here February 9, 10 and 11, of next year. Between 300 and 400 mantel and tile dealers will be brought to this city for the convention, and all portions of the United States are to be represented.

The Marvil Package Company of Marvil, Del., has given a contract to the Sharptown (Md.) Marine Railway Company for the construction of a large barge to be used in the transportation of gum timber from the South, this vessel making the third so employed.

There are indications that the activity in building at Baltimore will be smaller than it has been during practically the whole of the present year so far. September shows a marked reduction in the value of the structures for which permits were issued, due mainly to the fact that the banks, trust companies and building associations, are holding down on loans. It is stated in this connection that one of the largest of the building associations was cut down in its loans by the banks to about one third of its former credits, and this is having a decided effect upon new construction. That the demand for lumber used in building will be affected accordingly is likely, and the demand for hardwoods from this source may consequently be expected to undergo a contraction. The total estimated value of the buildings for last month was only \$161,743.

The first wooden block pavement to be put down here in some years has been contracted for. It will be laid on South street, from Lombard to Baltimore, and on Guilford avenue, from Baltimore to Fayette streets. The George Long Contracting Company has the contract, its bid having been \$9,478.75, or at the rate of \$2.75 per square yard. The blocks to be laid are cross-otted.

M. S. Baer of Richard P. Baer & Co., was in the Middle West practically all of last week, getting in touch with the firm's patrons in the section, and also calling on the firm's representative at Columbus, O. He states that he found business moderate, with indications more encouraging than he had expected.

John L. Aleock & Co. are making a search for a shipment of 100 tons of Circassian walnut, which was loaded on the German steamer Kerkyra at Battoum, Russia, just before the war broke out, the vessel leaving July 30. The shipment should have been sent to Rotterdam, and thence transhipped to one of the Holland Line steamers for Baltimore, but to escape capture the Kerkyra put in at Constantinople, where the logs were unloaded. What became of them afterward the firm has not so far been able to ascertain. The non-arrival of the logs is all the more annoying for the reason that they had been actually sold at a good figure, dependent, of course, upon delivery.

< INDIANAPOLIS >

The Island Creek Lumber Company of Peru has dissolved.

Application for a receiver for the Beech Grove Lumber Company, Beech Grove, has been made by C. S. Eaglesfield, treasurer of the company.

Claude Hixon, twenty-six years old, manager of the True & True Lumber Company, Bainbridge, was killed in an automobile accident recently.

The American Playground Device and Swing Company has reorganized with \$50,000 capital and will move its factory from Terre Haute to Anderson.

Aaron J. Wolfe, with vast lumber interests in Indiana, Illinois and Arkansas, died at his home in Crawfordsville recently. He was sixty years old. Burial was at Waveland, his former home.

Showers Brothers, furniture manufacturers at Bloomington, have just equipped a plant for the manufacture of kitchen cabinets in addition to their other business.

The Swain-Roach Lumber Company of Seymour, with mills at Seymour and Crothersville, expects to shut down its mill at the latter place for the winter.

H. J. Schied, R. B. Wilson and J. D. Wilson have organized the American Wood Products Company here with an authorized capitalization of \$100,000. It will manufacture a large line of wood products.

The Hoosier Veneer Company of this city, manufacturer of veneers and hardwoods, states that its present production is one-third less than it was at this time last year.

Detachable wood handles for all kinds of tools, will be manufactured by the Doddridge-Beck Detachable Handle Company just organized in this city by J. C. Beck, Joseph F. Ankenbrock and George J. Meyers. The company is incorporated with an authorized capitalization of \$25,000.

< MEMPHIS >

There has been some further curtailment of operations in the Memphis territory, but, while some mills are closing down, there are others which are preparing to resume operations. Resumption, in most instances, is due to the fact that here are certain kinds of lumber which have been sold up so closely that it is necessary to cut more to prevent stocks from becoming very much broken. Among the mills which have just started

up again is that of the Bellgrade Lumber Company, at Isola, Miss. A short time ago the mill of R. J. Darnell, Inc., at Batesville, started operations. Within the past few days the big band mill of Russe & Burgess, Inc., has been completed and started running. This firm has about 1,500,000 feet of timber on hand which will have to be converted into lumber. On the other hand, the Gayoso Lumber Company, which has been running both day and night most of the time, has shut down and will remain down indefinitely. Advices received here from Purvis, Miss., indicate that the big mill of the Hand-Jordan Lumber Company had ceased operations. Similar advices have been received from some other points and, despite the fact that there has been resumption on the part of some mills, the tendency has been toward decreasing rather than increasing production.

J. D. Flanagan and associates of Grand Rapids, Mich., will establish a hardwood plant at Hazlehurst, Miss., where they have already taken a long lease on the site and equipment of the Hazlehurst Lumber Company and have made arrangements for the remodeling of the plant. New machinery and other necessary equipment have already been purchased and are now in process of delivery. It is planned to have the new machinery in operation as soon as possible.

Exporters here report the uncertainty in ocean rates as one of the chief handicaps under which they are laboring. They say that this condition leaves them without any fixed basis on which to figure. It is reported that last Monday morning rates to both Liverpool and London were from five to six cents higher than the previous week, an advance of from fifteen to twenty per cent. Exporters say that the steamship companies raise or lower rates at will, in accordance with the amount of cargo offered. Selling lumber abroad at present is a very difficult matter under the most favorable conditions, and the fluctuating tendency of ocean rates only tends to make had matters very much worse.

The Anchor Saw Mill Company is doing a very satisfactory business. It manufactures boat oars and other products and is shipping these to both Italy and England. Mr. Dickinson, the manager, is congratulating himself upon the splendid luck the company had in getting its shipments delivered after the war broke out. It had an immense amount of stock on the water when hostilities opened but every item has already been delivered and accounted for. This firm is not only running its plant at Memphis, but is also operating the machinery which was recently installed in Louisiana.

There will be an important conference held here November 19 and 20 for the purpose of arranging more definite plans for capturing business in South America. This will be held at the Business Men's Club, but it is hoped that there will be representatives from all parts of the Mississippi valley. The Chicago Chamber of Commerce has definitely decided to send more than twenty representative business men and the New Orleans Chamber of Commerce has also indicated that it will be well represented at this gathering. J. M. Tuther, secretary of the Business Men's Club, is already getting out much literature on the subject and this is being sent broadcast throughout this territory in the hope that there may be as large a meeting as possible. Business men generally recognize that the present furnishes an excellent opportunity for getting after South American trade, as England and Germany, which have been doing the bulk of this business, are now engaged in a war which makes it practically impossible to supply the needs of their South American clients. The lumbermen of Memphis are anxious to increase their trade with South America and they are going to take an active part in the meeting. All of the South American business has been financed through London and it is hoped that, at this conference, a plan may be arranged whereby the financing may be done through New York or some other center in America.

James R. Blair, for a number of years manager of the L. H. Gage Lumber Company and the Crittenden Lumber Company, first with headquarters at Memphis and later at Earle, Ark., has resigned his position to accept the management of the big double band mill of R. J. Darnell, Inc., at Batesville, Miss. Mr. Blair brings to his new duties a wide experience in the manufacture of hardwood lumber and a broad knowledge of the requirements of the American and foreign trade as applied to southern hardwoods. The firm is being congratulated upon having secured the services of Mr. Blair. The mill of R. J. Darnell, Inc., at Batesville, was finished some months ago and, while it closed down immediately after the war, operations have been resumed on one side within the past two or three weeks.

The Cybur Lumber Company has sold to the Cybur, Gulf & Northwestern Railway Company its 12-mile line in Pearl River county, Mississippi, for a consideration of \$65,000. This road was used for a number of years for private purposes, including the hauling of lumber and logs. With organization of the purchasing company, however, it will enter the field as a common carrier and will do both passenger and freight business. This road runs through a section which is very rich in timber resources. The capital stock of the Cybur, Gulf and Northwestern Railway Company is \$75,000 and C. W. Zimmerman, of Mobile, Ala., is president.

D. D. Nellis, manager of the Memphis branch of Jno. M. Woods & Co., Boston, who recently suffered a slight stroke of paralysis, has recovered sufficiently to be at his office again. While he was at no time dangerously ill, he was confined to his bed for a number of days and some anxiety was expressed by his numerous friends, who are congratulating him upon his early recovery.

decided to remove its plant from that point to Jackson, has held a conference during the past few days with officials of the Illinois Central regarding the necessary trackage facilities at Duttoville, a suburb of Jackson, where the plant will be located. Engineers are already making the necessary surveys and plans will shortly be completed for the removal.

The Poinsett Lumber Manufacturing Company of Trumann, Ark., has opened offices at Memphis, through which the output of the firm will be sold and through which the necessary timber requirements will be purchased. The offices are located in the Exchange building and are in charge of A. B. Turner. This company has a band mill and veneer plant at Trumann. The former is in operation, but the latter is closed down for the present.

The Southern Railway has recently filed an order for 15,000 tons of steel rails to be used on its system. Part of these will be laid between Atlanta and Washington, but a considerable portion will be used for the yards now being completed at Buatyn, just east of Memphis. These yards are being constructed at a cost of about \$1,000,000. This order is one of the largest that has been filed by a southern railroad in some months.

G. D. Burgess of Russe & Burgess, Inc., has returned from an extended business trip which carried him through Chicago and most of the northern and eastern lumber centers, as well as through several points in Canada. Mr. Burgess says that it was possible to sell some lumber but that the demand is far from keen and that there is no disposition on the part of either consuming or distributing interests to anticipate their requirements.

Southern business men generally are congratulating themselves upon the practical completion of the plans for a \$150,000,000 fund to be loaned to cotton planters for a period of twelve to eighteen months on the basis of \$30 per bale. It is believed that this is the most tangible effort which has been made to relieve the situation in the South caused by the European war and bankers and business men generally are awaiting with much interest the actual putting into effect of this plan. It is proposed by this method to retire 5,000,000 bales of cotton from the market for at least a year and the loans are so made that they can be renewed for six months at the expiration of the first year. The loan value agreed upon by the syndicate raising this fund is practically as great as the selling price of cotton and there is no doubt that every dollar of the money will be taken in very short order. Warehouse receipts are to be given as the basis for the loans. Every effort has been made to afford relief to the people of the South because of the recognition of the fact that undue depression in the South would necessarily be felt throughout the United States. It is believed that this plan will enable merchants and farmers in the South to meet their obligations which begin to mature around the first of November, and that it will bring about greater commercial and industrial activity than could have been secured in any other way.

< BRISTOL >

The mills throughout this section have nearly all closed down, as a result of dullness in the trade, and expect to remain closed until conditions improve materially. A goodly per cent of the mills now operating expect to close soon, while others are working on timber that must be moved in a specified time and are therefore compelled to run. Most of the lumbermen do not anticipate that they will start up again before April 1, unless there should be radical improvement in the trade.

The yards in this section are not so well stocked as last year. Only a small per cent of the yards have more stock than at this time last year while a large majority of them have less. It is believed that the present curtailment will soon equalize the supply and demand, which will result in improved business. The lumbermen here think business will rapidly adjust itself to the present extraordinary conditions, growing out of the European war.

The Paxton Lumber Company of this city is still running one or two of its mills, due to the fact that it has some timber that must be cut, but expects to close down entirely at an early date. The Bristol Door & Lumber Company, the Peter-McCain Lumber Company and others are entirely closed down. Both report less stock on hand than at this time last year and the Bristol Door & Lumber Company over forty per cent less.

Reports from east Tennessee and southwest Virginia, especially among the larger mills, indicate that there is a general movement to close the mills and remain closed until business improves. The lumbermen say they do not believe it is profitable to operate under present conditions. The situation has not, as yet, affected the price of timber as many operators have their eyes on new boundaries they had hoped to buy at a lower figure, as a result of the present depression.

< COLUMBUS >

The Smith-Howe Lumber Company, which was incorporated recently with an authorized capital of \$10,000, has opened offices in the Brunson building to deal in wholesale lumber. T. E. Smith, formerly connected with the South Side Lumber Company, is general manager.

A survey of building operations in Columbus shows that building is the most active on the East Side. This is due largely to the comparatively low price of building lots. There is also an active building area around Olentangy park in north Columbus. The buildings consist largely of dwellings, double houses, flats, apartments and small store buildings.

Papers have been filed with the secretary of state decreasing the capital

of the Dewey Stave Company of Toledo from \$300,000 to \$30,000.
 The Blodgett Lumber Company of Warren, Ohio, which has occupied a portion of the plant of the Lyman Paul Company, will move to a Michigan town.
 The Rogers-Abbott Lumber Company of Cincinnati has been incorporated with a capital of \$25,000 to do a general lumber business by E. C. Rogers, W. H. Abbott, N. R. Abbott, A. E. Rogers and H. L. Rogers.
 The Elk River Coal and Lumber Company of Clay, W. Va., has opened an office in the Columbus Savings and Trust building, Columbus, with C. M. Anderson in charge.

The plant of the Valley Lumber Company of Youngstown, Ohio, has been damaged to the extent of \$6,000 by fire of unknown origin.
 Work has been started on the line of the Chesapeake & Ohio railroad to connect Columbus and Portsmouth which parallels the Norfolk & Western. The concern will build a \$3,000,000 bridge across the Ohio river at Sciotoville.

The Portage Furniture Company, with an authorized capital of \$6,000, has opened a factory at Akron, Ohio.
 F. B. Pryor of the W. M. Ritter Lumber Company reports a fairly good demand for hardwoods. Prices are pretty well maintained and the prospects for the future are brighter. He says buying on the part of factories is increasing and now counterbalances the retail demand.
 A. C. Davis of the A. C. Davis Lumber Company reports a fairly good demand for all varieties and grades of hardwoods.
 J. A. Ford of the Imperial Lumber Company reports a good movement of hardwood stocks in this territory.

< LOUISVILLE >

The annual meeting of the Louisville Hardwood Club, which will be held November 10, is monopolizing the attention of lumbermen in this market at present. Owing to the fact that the club will be completing its sixth year, making it one of the veterans among local lumber clubs, hardwood men are keenly interested in seeing that the next year helps to maintain the prestige and influence of the organization. Stuart R. Cecil of the Booker-Cecil Lumber Company is president of the club, his predecessors in the office having been Edward L. Davis, T. M. Brown, and A. E. Norman.

It looks as though lumbermen affected by the Louisville & Nashville milling-in-transit circular, which has been objected to recently on the ground that it gives insufficient time in which to claim the refunds, the limit being one year, will have to go to the Interstate Commerce Commission for relief, as the road has refused to grant the petition of the Evansville, Ind., Lumbermen's Club, in which the Louisville Hardwood Club joined. It is a question whether the Interstate Commerce Commission will act, however, as its previous decisions have laid down the principle that milling-in-transit is a privilege to be given or not, as the road sees fit.

Practically all of the sawmills in Louisville have been shut down on account of trade conditions brought about by the war. The mahogany mill of the C. C. Mengel & Bro. Company is running, but its dimension mill is down. The mahogany trade is as dull as the rest of the hardwood business, apparently, the supply of logs, in spite of the war, being greater than the market requires to supply the present reduced demand. The reduction of manufacturing capacity in this territory is graphically indicated by the fact that a local wholesale concern, which required a special bill to be cut up, as the order which it had was for an unusual dimension which was not in stock, found that every manufacturer whom it addressed had either closed his mill or was preparing to do so, and that it was next to impossible to get the sawing done. Some of the Kentucky river mills will probably continue operating, as a logging tide had been running, bringing down a number of logs which will have to be cut up to avoid depreciation.

Small lumber operators have been unusually unfortunate this year in having boiler explosions, suggesting that ignorance or carelessness, or both, have combined to bring about destruction of life and property. The latest casualty was reported from Rodman, near Morehead, Ky., where the mill of M. T. Dillon was destroyed when the boiler exploded. One man was killed and a number, including the owner, were seriously injured by steam and flying pieces of iron. The cause of the disaster was reported as unknown, as in most other cases, but carelessness in not watching the water supply is believed to be the cause in nearly every instance.

State Forester J. E. Barton's fire-fighting organization, composed of wardens in each county, bids fair to be of great value this season, as the weather has been very dry and the danger of destruction of timber is thereby increased. He has appointed a warden in nearly every county where there is much timber, most of them being in the eastern part of the state, though some in the extreme western section have been named.

A big deal in timber in eastern Kentucky, one of the biggest, in fact, announced recently, is that whereby the Broadhead-Garrett Lumber Company of Winchester, Ky., has taken over 5800 acres of hardwood timber from the Daney Lumber Company. Of this area 2800 acres lies in Powell county, and will be developed first. A 10-mile standard-gauge road is already equipped, and a band mill will be erected there. The remainder of the timber is in West Virginia, and probably will not be opened up immediately. Green Garrett, who is a member of the state railroad commission, is the active manager of the Winchester concern.

GEO. C. BROWN & CO., PROCTOR, ARK.

(20 miles from Memphis, on C. R. I. & P. Railroad)

ARKANSAS

Fire, which was discovered in the early morning of October 11, destroyed the George Moore Handle Factory at Ashdown, Ark. Practically the whole plant was in flames when first seen. The factory had been closed down for several days on account of the poor market for its output, and the origin of the fire is unknown. Two cars of lumber, which were standing near the factory on the tracks of the Memphis, Dallas & Gulf Railroad, were also badly damaged. The total loss, including plant and lumber, is placed at \$4,000, with some \$1,500 insurance.

The H. D. Williams Cooperage Company of Leslie, Ark., will soon install machinery for the purpose of finishing up barrels. This addition to the company's plant will mean the employment of about fifty additional men.

E. B. Griswold & Co., Cotter, Ark., is enlarging its plant by installing new machinery which will increase the number of products turned out by the company. Among other things a large planer is being placed. The company has heretofore manufactured only pencil slats, but from now on it will turn out other dimension stuff and finish cedar lumber. E. B. Griswold, as the head of the company, is planning to still further enlarge the plant's capacity so that it can produce fan handles, advertising pencils and other novelties.

George W. Hays, governor of Arkansas, recently received \$9,980 from the Treasury Department of the United States government as the amount due from the sales of timber during the past year from the Ozark and Arkansas Forest Reserves in this state. This sum represents twenty-five per cent of the total amounts realized from the sales of timber from these reserves during the year 1913, and will be used in building roads through the sections of the state in which the national forests lie.

That the railroad company was liable for damage resulting to stave bolts through deterioration while waiting for transportation to be provided was the finding of the Jefferson county circuit court on October 17 in the case of A. L. and E. D. Paul against the Saint Louis, Iron Mountain and Southern Railroad Company. The plaintiffs sued to recover damages alleged to have been sustained by them by reason of the deterioration in value of certain stave bolts on account of the delay occasioned by the railroad company in providing transportation, and a judgment was given in the sum of \$78.20.

The Neely sawmill, which has been in operation about six miles from Poughkeepsie, Ark., during the past several months, was closed down on October 16. The shut down was occasioned by the fact that numerous orders have recently been cancelled by the wagon manufacturing concerns to whom the Neely company sold its output. The mill has had a pay roll of \$2,000 per month, and its closing down at this time will be keenly felt by the people of that community.

Very unique has been the experience of the Noris Mill Company because of the European war. This company owns and operates a mill in Dallas county, Arkansas, near the town of Fairview, and formerly employed several hundred men in and about the plant. On the breaking out of hostilities in Europe the company felt forced to close down, as the export market on which it depended had been shut off. It happens, however, that the head of the company is an Englishman, and recently the mill received orders from England for several cars of spokes to be shipped to the British army, to be used in making spokes for the cannon carriages. So the mill has been reopened, and is now cutting hardwood with the energy as of other days.

It is stated by those who should know that the production of hardwood in Arkansas at present is not more than thirty or forty per cent of normal. Fully fifty per cent of the larger mills have been closed entirely, or are running only on short time. Still others are planning to close down in the near future. The prices are standing about on the level with those of two weeks ago, and there appears little inclination on the part of the mills to push their stocks on the market, even though the stocks on hand at present are slightly in excess of what they were this time last year. It seems sure, however, that the policy of curtailment that is being so generally followed just now is bound to reduce the supply to the place where it will demand a good price. The millmen, for the most part, believe that the future holds in store considerable buying that has been put off about as long as it can be.

WISCONSIN

The M. H. Sprague Lumber Company's sawmill at Washburn has been closed down for the season.

Edward Cornillie, a member of the firm of Cornillie Brothers, Milwaukee, manufacturers of saloon and refrigerator fixtures, died on October 15, at the age of 67 years. Mr. Cornillie was engaged in the fixture manufacturing business for half a century. He is survived by his widow, one son, George, and a brother, Charles.

The A. E. White Machine Works of Eau Claire, turning out a line of saw swages and shapers, has completed the work of remodeling its plant and will install considerable new equipment within the near future, in order to increase its capacity.

The Menasha Wooden Ware Company, operating plants at Menasha and Ladysmith, has completed the erection of an addition to its Ladysmith branch. The company is now remodeling its dry kiln at Ladysmith.

The Kenfield-Lamoreaux Company of Washburn is now operating its

sawmill on a day and night shift. The company's large box factory is again in operation after a close down of two weeks. The company has a large supply of logs on hand.

The Peshtigo Lumber Company of Peshtigo has discontinued the night shift at its sawmill and will now operate the plant days only. The company has a large supply of logs on hand.

The big sawmill of the Rust-Owen Lumber Company at Drummond, Bayfield county, is said to be the only Wisconsin mill which is still sawing white pine exclusively. All the other mills of the state are turning out hemlock or hardwood in addition to pine. The Rust-Owen concern owns a large tract of white pine in Bayfield county that will keep its mill in operation for the next ten or twelve years.

The Milwaukee-Western Barrel Company has been incorporated in Milwaukee with a capital stock of \$10,000 by M. Fredman, Samuel Fredman and Meyer Eronik.

The Wisconsin supreme court has denied a rehearing in the case of W. H. Bonnell against the Omaha railroad, sustaining the ruling of the circuit court of Douglas county, which awarded Mr. Bonnell \$7,000 damages for the loss of his sawmill at Hawtborne. Mr. Bonnell claimed that his mill, which burned two years ago, was set afire by a spark from an Omaha locomotive.

The Wenzel Broom Company of Eau Claire is erecting a new warehouse, 48x50 feet in dimensions, to be used for the storage of raw material and finished stock. The company is now turning out forty dozen brooms daily.

Fred Ollhoff, well-known lumberman, of Merrill, is establishing a record in removing "deadbeads" from the Wisconsin river in Merrill. During the past summer, Mr. Ollhoff has succeeded in clearing the river of about 1,500,000 feet of logs and has cut about 7,000,000 feet of lumber. The lumber is sawed at the Ollhoff mill. Two steamboats and more than thirty men are at work on the job.

The Kinzel Lumber Company of Merrill has dismantled its old planing mill and is preparing to erect a new plant. It is hoped to get the new mill in operation by the first of the year.

C. F. Ringer, Milwaukee architect, has completed plans for the erection of a new plant for the Sheboygan Cigar Box & Lumber Manufacturing Company of Sheboygan, to replace the plant destroyed by fire last April. The building will be two stories high, of frame construction, 60x140 feet in dimensions, and will cost \$20,000.

It is understood that a new lumber manufacturing concern is negotiating for the large lumber plant of the Barker & Stewart Lumber Company of Wausau. The Barker & Stewart concern, which is preparing to leave the Wisconsin field, will be ready to give possession of its plant just as soon as it disposes of its large amount of lumber on hand.

The Fond du Lac Church Furnishing Company of Fond du Lac, has awarded contracts for the erection of an additional story to its main factory building. The addition will be 60x175 feet in dimensions and will be used for the finishing and general cabinet work. William Mauthe, president of the company, reports that the addition has been made necessary by the increase in business.

Edward Bradley, wealthy lumberman of Milwaukee, who died December 26, 1912, left an estate valued at more than \$3,260,000, according to the appraisal just completed at the order of Judge Karel of the Milwaukee county probate court. In addition to this amount, the estate includes real estate in Illinois, Minnesota and Washington, as well as in four counties of Wisconsin, all of which has not been included in the appraisal.

The American Woodworking Machinery Company is preparing to dismantle its branch plant at Green Bay and will move the equipment to Rochester, N. Y. Some of the company's employes may go to Aurora, Ill., or to other cities in which the company maintains plants.

The New Dells Lumber Company of Eau Claire recently closed down its sawmill after a continuous run of eleven months and three days, said to be the record season's run of any sawmill in Eau Claire. Chiefly hardwood and hemlock were turned out. The plant will now be overhauled.

R. S. Kellogg, secretary of the Northern Hemlock and Hardwood Manufacturers' Association, has issued a lengthy and interesting standardized menu for use in lumber camps. Mr. Kellogg made use of government statistics, relating to the navy and war reports, and to reports from the University of Wisconsin. It is expected that the results will be published in pamphlet form.

◀ DETROIT ▶

The Falcon Manufacturing Company, manufacturer of cabinets, has completed improvements and the installation of new machinery at its plant at Big Rapids, Mich.

The Loud Lumber Company, of Charles, is engaged in building a railroad into a new tract of hardwood timber, which will provide its plant with a considerable cut.

Ground has been broken for the erection, at Hancock, Mich., of a plant for the Kelley Furniture Company, of Grand Rapids. The building will be completed within a month when all machinery will be moved from Grand Rapids to the upper peninsula. The company through the move will be located in the center of a great hardwood belt and will have excellent shipping facilities.

has accepted the position of manager of the Holland Furniture Company at Holland, Mich.

The North American Construction Company of Bay City, manufacturer of ready-cut houses, will not build a plant at Essexville, as previously announced, having instead purchased the mill property of Mershon-Bacon at Bay City. It will be extensively repaired. The decision not to build at Essexville followed a question as to the legality of a bond issue voted by the village to buy a site for the plant.

It is announced that the sawmill of the Eddy Lumber Company in the Lake Linden district of the upper peninsula will continue in operation for about a month. The mill has been cutting more than 30,000 feet of lumber per day and has been operated steadily since early spring. Preparations to open the winter camps before long are being made. By November 15 it is expected the company will be lumbering on two tracts.

Wittock & Son commenced logging at Randville, Mich., under contract for the J. W. Wells Lumber Company. The logs will be shipped to the Wells mill at Menominee.

An involuntary petition in bankruptcy has been filed in the United States district court at Bay City against the Saginaw Wood Products Company of Gaylord, manufacturer of wood specialties.

F. E. Parker, president of the Mershon, Eddy, Parker Company, which operates a plant at Saginaw, says regarding the situation after a trip to the East: "The European war has resulted in a material check on building operations, which has adversely affected the trade. However, most of the eastern yards are carrying fair stocks and have done a larger business than would have been expected under existing conditions. There is a tendency the country over to confine buying to immediate necessities." The company's plant at Saginaw is running seventy-five per cent of normal. While in the East Mr. Parker obtained a good-sized order for export doors, which is now keeping the factory busy.

Work on the construction of the Manistique Coeprage Company's new factory at Manistique will be started soon. The plant when completed will comprise eight buildings and will have a large capacity. The company will keep a large stock of timber on hand and for that purpose will erect a big stock shed. The eight buildings when completed will comprise as modern a coeprage plant as is possible to build. The company will use birch, beech and maple, of which there is plenty standing near Manistique.

A test case to establish an important point in the income tax regulations has been started in the United States district court at Grand Rapids by the Mitchell Brothers Company of Cadillac, Mich. Action has been filed against Emanuel J. Doyle, collector of internal revenue, as the nominal defendant. The suit is brought to recover \$2,700 in taxes, but the primary object is to make unnecessary the payment of further sums which will have to be paid unless the company's contention is established, namely that it has the right to deduct from the tax during the four years from 1909 to 1912 for depreciation in capital assets.

Lake shipping is apparently picking up toward the close of navigation. Considerable lumber is being received at Bay City. The North American Construction Company has received 2,500,000 feet of lumber from the Loud Lumber Company, at Charles, and 409,000 feet from St. Ignace on the steamer Buckley and 261,100 feet on the steamer M. Sicken from the same point. Bradley, Miller & Co. have received 404,000 feet from Duluth on the steamer J. P. Donaldson. The same company has just received 661,000 feet on the steamer Dayton from Duluth and 267,790 feet on the A. W. Wright from Sprague, Ont. E. B. Foss & Co. have received 285,577 feet from Blind River.

In the circuit court of Oakland county at Pontiac, Mich., Judge Smith has granted an order admitting the final account of Receiver C. A. Harris of the Michigan Oak Flooring & Interior Finish Company as filed and amended. The order included that the assets of the company, including plant and real estate, be turned over to the D. E. Hewitt Lumber Company of Huntington, W. Va., to which practically all of the creditors have assigned their claims at sixty cents on a dollar. The Hewitt company is a large manufacturer of hardwood products at Huntington and it is announced that if the Pontiac plant is not opened and operated the firm contemplates operating it in connection with the Huntington interests. The Michigan Oak Flooring and Finish Company went into receiver's hands August 1912.

It is refreshing, particularly at a time when talk of depression and curtailment rules the world of speech, to note the action of the Dwight Lumber Company, manufacturer of hardwood flooring, mouldings and interior finish, in remodeling its plant at Detroit, Mich., so as to have double the capacity in 1915 that it now has. This company entered the finish business four years ago and each year its trade has increased in comparison with the growth of Detroit. Business has been good this year.

Although it is not generally known, the Dwight Lumber Company enjoys considerable export trade with England in interior finish, which trade has all been built up in the last four years. Many homes in the British Isles are finished with the "made in Detroit" product and officials of the company say that the business has been little disturbed by war. Shipments are being made steadily.

One of the landmarks of Bay City's early lumber days is passing with the dismantling of the Gates sawmill. It was built in 1863 by Gates & Fay, and has been idle for three years. The mill cut 50,000 feet a day and in single sawing seasons its cut averaged 9,500,000 feet. For half a century it operated steadily.

The Hardwood Market

< CHICAGO >

Chicago now in common with other large centers is the gathering point for sellers of lumber and other commodities who, realizing the necessity for placing many orders of small proportions rather than a few orders of large proportion, naturally migrate to those points offering opportunities for seeing many prospective customers. As a consequence, there is a great deal of lumber offered here at present. However, in spite of this, prices have not broken to the extent which seemingly had been anticipated. No one will argue that prices are firm or that there is a real market here for lumber, but reputable concerns are refusing to sell stock at figures which mean for them direct money losses. The prevalence of this policy is really astonishing as it is established on actual inquiry and investigation. It augurs well for the business caliber of the average lumberman.

Building in Chicago is still of course very inactive, but there is enough construction going on to take care of very considerable quantities of building and finishing lumber, and at the same time the woodworking factories are keeping fairly busy.

That their trade is as uncertain as is the trade of the lumbermen is shown by the way they place orders. They seemingly get a line on concerns who are in a position to furnish certain items of stock, and when they are in need of this stock they personally get into communication with the lumbermen and place their orders. This method is being illustrated time after time and simply proves that lumber is being sold in greater quantities than is fully realized.

Of course the condition is dull. There is no questioning this fact. However, most of the Chicago trade is making plans to take advantage of any favorable developments which might effect the rest of the country, and in the meantime is showing a remarkably commendable disposition toward the extremely trying circumstances which they are facing.

< NEW YORK >

The lumber situation in New York with respect to the hardwood end particularly is still far below normal with most of those evils that go to make dull times as much in evidence as ever. In spite of the great curtailment in output, there are available now ample stocks for current needs and buyers evidently look upon the easy offerings as an indication that there will be no scarcity of supplies to meet all demands that may eventuate. So far as prices go, there is no market. The same conditions probably appear in other large markets but it seems to be a rule to send all surplus lumber stocks to New York with the result that values are demoralized. It is one thing to say that low prices do not increase the use of lumber and another thing to hold out for higher—and fair—prices in the face of heavy carrying charges and ruthless price cutting. If some commission men would see the right side of the question and be content to do a smaller amount of business at better prices, the market would be better for it. This steady cutting of prices for the sole purpose of making a sale will go farther toward keeping the market in its present weak condition than any other thing.

< BUFFALO >

The hardwood trade has not shown any change of front within the last two or three weeks and is unusually quiet, despite the fact that many sawmills are now closed down. Local dealers are being requested to take stock off the hands of the producers and the prices asked are somewhat below the regular market. The situation is expected to work itself out before very many weeks are passed, but just now the market is in a depressed condition, with sales few in number and small in size.

There is not much activity in any special hardwood, though plain oak is getting as large a sale as anything. Maple is also one of the leading woods. Poplar is a slow seller and little is doing in chestnut. The flooring trade is on a fair scale, though prices have to be cut occasionally in order to keep stocks moving. Low grades of most hardwoods are in demand and the figures asked show no weakness.

< PITTSBURGH >

Hardwood matters are very unsatisfactory here as everywhere. Buying is limited almost entirely to immediate needs. Considerable price cutting is being indulged in to stimulate buying but it is not effective. Manufacturers are hyning very little. Yard trade is slow and uncertain. Flooring has been a pretty good seller in this market but even for this stock demand is now pretty light. Hardwood mills are beginning to wonder if they can keep on running this winter with conditions as they are at present.

< PHILADELPHIA >

There has been no progressive advance in the hardwood business during the last fortnight, but owing to the curtailing of output, values have

been steadied in certain lines, which is an improvement. The most sanguine optimist is not disposed to predict an early revival of an aggressive prosperity, but the vigorous efforts being made by the large commercial bodies for the opening of new trade it is felt must ultimately be successful. A less stringent hold on loan money by the trust companies, which seek building operations as a source of investment, has given an impetus to building work, which will last well into the winter months, and combined with the activity in this line in all of the large suburban towns, will result in a fair volume of business in building lumber and supplies, relieving in a measure the depression which has existed in this line of trade for some months. New factories for the manufacture of products heretofore obtained only from the foreign market will soon materialize and help to swell the building total for 1914.

Buying continues strictly on a hand-to-mouth basis, and although prices are believed to have reached rock-bottom figures, there is no inclination on the part of the buyer to stock up for future use. The money market remains tight, in consequence of which retrenchment is the rule everywhere. Collections are slow and it is realized by the experienced merchant that to press for settlement at this time would only result in

THE GLUE THAT IS APPLIED COLD

In Flush Veneered Doors

The chief consideration is uniformly high-grade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Use

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing—for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

Tacoma, Washington, U. S. A., Sept. 29, 1913.
File B.

Perkins Glue Company,
South Bend, Indiana.

Gentlemen: The convenience and economy of the use of Perkins vegetable glue, its uniformity and the satisfactory results we have obtained, together with the courtesy we have been uniformly shown by the officers and representatives of the company, prompt us to express in this way our appreciation of the Perkins Glue Company and its products.

Yours very truly,

THE WHEELER, OSGOOD COMPANY,
RHC:S R. H. Clarke, Treasurer.

Perkins Glue Company

Originators and Patentees

805 J. M. S. Building, South Bend, Indiana

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

disaster, the most serious of which would be in the large run the loss of a long tried and valuable customer. A cheerful feeling as to the eventual steady income of business from foreign countries now compromised by the great war prevails everywhere, and business much or meager is conducted in the same spirit. Price quotations at this time cannot be counted on as a reflex of the actual condition of the market as some small man in need of money may be induced to unload, while the average substantial dealer declines to part with his stock as he knows at the first sign of activity he will realize a larger profit.

< BOSTON >

There has been no change in conditions since last report. The most noticeable cause operating to influence the market is the constantly increasing offers of southern and western hardwoods, representing a very large amount of lumber. The effect on prices is not yet proportionately felt, although there are a number of the items being sold under recent market prices. The curtailment reports are no doubt responsible to a considerable extent for strengthening both quotations and actual selling prices. General business here is quiet, although the facts do not disclose anything that should have serious results on the hardwood trade. Aside from prevailing conditions the powerful influences of opinions and "outlooks" are having more than their share in guiding many operations. Naturally, the severity of the war and the practically complete stoppage of foreign trade from the ports of New England have produced unusually depressing conditions but most of the lumber dealers regarding the situation as only temporary are simply planning to operate conservatively for the time being with very reasonable grounds to expect much better values and volume of business as soon as returning activity necessitates replenishing the present low stocks.

Quartered oak and ash are but very slightly off from normal figures; plain oak has declined to a somewhat greater extent in all grades. Poplar remains at the rather low level reached in the summer. Birch, beech and maple are in moderate demand with only a few cuts reported. The call for cherry and walnut is quiet, but values are well maintained. Quartered sycamore is in good demand and brings full market prices.

< BALTIMORE >

No important changes have taken place in the hardwood trade within the past two weeks. Nor can it be said that a definite gain in the volume of business is to be recorded. Orders come in in a decidedly irregular manner, and tend to affect the views of the hardwood men as to the state of business. Buyers place orders only as the stocks are actually needed, and it is frequently up to the seller to make the buyers realize that they have wants. This disposition to hold down is even more pronounced than it was during the first months of the war and its cause can be found in the financial conditions that have developed by reason, primarily, of the conflict. Notwithstanding all talk at Washington about forcing the banks to meet the needs of their customers and preventing financial pressure through publicity, the fact remains that the banks have tightened their cash boxes to an appreciable degree. Credits have been narrowed fifty or even seventy-five per cent, the banks refusing to discount paper or make loans, and the manufacturers who use hardwoods feel the effect of this curtailment of accommodations. The buyers are not in a position to take advantage of bargains in lumber, and the domestic movement is halted to a considerable extent by the suspension of virtually all speculative business. Hence it is, too, that the demand varies with the different sections, one of the latter purchasing with some freedom, while another is quiet, this state of affairs being reversed in a short time. Furniture manufacturers and other consumers are having a fair amount of work in hand and must take care of these needs. And thus it happens that some days the sellers get a volume of business which makes it appear almost as if an actual revival had taken place. Some of the hardwood men here, for instance, report that of late No. 1 common chestnut has been in fair request at figures that are little, if at all, lower than those that prevailed some time ago. Oak is about holding its own, and the same can be said for most of the other woods.

As for the foreign trade, that leaves much to be desired. September proved to be less satisfactory than August had been, a further recession in the movement taking place. On the other hand, it is also to be said that the British buyers seem to have reached a low ebb in their supplies, and that they have been taking stocks of late in increased quantities. Poplar has been called for especially, and the prices offered are fairly attractive. Of course, the foreign buyers in a position to do any business at all have no unusual requirements to take care of, and they make no provision for the future, but the depletion of the stocks none the less brings out orders, many of them for heavy lumber, and the United States is at present the main source of supply. This state of affairs may before long be expected to bring out a very fair volume of trade, and there is every prospect that the foreign movement will increase, with some improvement in the range of prices.

< COLUMBUS >

The hardwood trade in Columbus and central Ohio has been running fairly steady during the past fortnight. Demand has been fair when the business conditions are taken into consideration. Buying which has been the best on the part of the retailers is now switching to manufacturing

establishments. The demand from both sources is about equal but if there is any preponderance it is on the side of manufacturing plants. The tone of the market is still good and prospects for the future are not considered bad.

One of the best features of the trade is the renewed activity which has characterized building operations. This is true not only in Columbus but also in the cities and towns in central Ohio. Since the European war made money tight, banks and building and loan organizations have become easier and many building projects which were stopped temporarily are now proceeding. This means an additional demand for hardwood stocks among the retail trade. Dealers' stocks are not large and the retailer is still buying only for the immediate present.

Factories engaged in manufacturing furniture and vehicles are purchasers of hardwood stocks. The same is true of automobile concerns which are buying wide sizes of poplar. Taking it all in all the prospects from manufacturing lines are better than has been the case for several months.

Prices are fairly well maintained at the levels which have prevailed for some time. Some declines off the list of several months ago have been recorded. Generally speaking the list is upheld fairly well although some cutting is indulged in to force trade.

Quartered oak is holding up well although the demand is not very strong. Prices are unchanged from the previous month. There is a fairly good demand for plain sawed oak.

————— < INDIANAPOLIS > —————

The hardwood trade has not shown any improvement in the last two weeks. Trade is inactive, although prices are still at a comparatively good figure except gum. Automobile and furniture factories and building operations, which normally consume large quantities of hardwoods are practically at a standstill in the state.

It is said banking conditions are largely responsible for present conditions. Investigation has shown vast sums of money in most banks but for the most part banks are extending very little accommodation. The manufacturers thus cannot obtain cash to carry on business and as a result thousands of workmen are out of employment, or working part time. As a further result, the ultimate consumers have nothing to buy with.

Hardwood mills are greatly curtailing production. Some of the mills have a large amount of stock on hands, one mill having fifty per cent more hardwood lumber on hand than it had a year ago. A further curtailment will be made by some of the mills, if business does not improve shortly.

————— < TOLEDO > —————

The hardwood situation is showing little change over what it was a couple of weeks ago. The local yards are well filled and buying is extremely light. Dealers are uneasy owing to the tightness of the money market and are not inclined to buy anything except what is needed to cover present requirements. These present requirements continue to make a demand for considerable lumber. The building business in Toledo continues and the high grade of structures erected here has not been affected by the general conditions of the market. Toledo people demand quality and builders are giving it to them. Hardwoods are extensively used in all residences, apartment houses and flat buildings now being put up and of course the investment structures make a market for goodly quantities of hardwoods. The new schools to be constructed here will also make a market for a large quantity of hardwoods. Toledo is to have several new schools to take care of the rapidly increasing population. Prices are holding fairly well and there is a fair demand for boxing materials and for hardwood crating.

————— < NASHVILLE > —————

The hardwood situation has shown very little change the past two weeks, and in fact the same story would have described the situation for the past two months or more. However, the industry is becoming more adjusted to the conditions brought about by the European war, and is settling down to that basis. Business is running about twenty per cent below normal, but there is little complaint from the hardwood firms in this territory, and they continue to take an optimistic and hopeful view of the future. There is a good deal of curtailment of production, but not a few of the concerns are operating their plants not much below the normal in order to keep their organizations. One firm reported a shipment of a car of hardwood to Scotland last week, and occasional export shipments are being made. Prices are fairly well maintained. Plain oak is probably the largest seller, with demand for chestnut, poplar, ash and other hardwoods. Flooring is in fair demand.

————— < LOUISVILLE > —————

The most encouraging feature of the situation at present is improved collections. While there has been some renewing of notes, debts are being liquidated quite generally, and consumers of lumber seem to be in a position to take care of their obligations. This may be due to the fact that they are operating on a smaller scale, and require less capital than usual to take care of their business. The banks have not shut down on their customers, but are discounting lumber paper without hesitation. In fact,

Attorney in Fact
KANSAS CITY, MO.

the attitude of financial institutions in this part of the country has been encouraging, as they have been willing to assist legitimate business in every way possible. A somewhat better demand for lumber for export has encouraged the local trade. Walnut, ash and oak are among the items wanted for foreign shipment, quartered white oak being the leading mover in this direction. For the domestic trade business continues below normal as to volume, but prices are holding up on everything except lines on which there is an obvious oversupply. Specialties which are not in excess supply are bringing good prices.

< MILWAUKEE >

Trade in the Milwaukee hardwood market seems to be showing slight improvement. There is considerable building going on in the city and about the state, although probably not quite so much as a year ago. The excellent weather which is prevailing is doing much to further building activity, especially in the smaller cities and towns and in the country districts. Farmers have been making good use of the fine fall weather to complete much delayed building. Wholesalers are confident that this will eventually result in a better yard trade.

An apparent slump in building activity in Milwaukee during the past few weeks is disproved by a comparison of the Milwaukee building records with those of cities throughout the United States. Milwaukee is one of twenty cities in the country that showed building gains in September over the preceding month. Of these twenty, only eight surpassed Milwaukee. During the third week in October there were 61 building permits issued for structures to cost approximately \$167,642, as compared with 91 permits and an investment of \$249,646 during the corresponding month in 1913. Work on many large structures was started during September and these projects are helping along the lumber business locally.

While buyers in general are inclined to place orders carefully and to satisfy their immediate wants, the total volume of trade is fairly satisfactory. The sash and door and the various interior finishing concerns are buying fairly well to meet their fall business. None of these concerns are laying in stocks, however. The farm implement manufacturing concerns in Milwaukee and about the state have been placing some orders, but a better trade from this source is hoped for later in the season. The furniture factories are buying in a conservative manner.

Prices are a little unsettled in some lines, but no decided decline is expected, due to the certainty that the lumber output will be curtailed from now on. Practically all lumber concerns in Wisconsin will log less and saw less lumber during the coming season than in several years. Northern stocks are holding firm, due mainly to the tight supply and to the knowledge that the production will be restricted. Birch and maple seem to be especially strong. Oak is still rather easy.

< DETROIT >

The hardwood market at Detroit is not good enough to be called satisfactory, but Detroit dealers will let it adjust itself without any attempts to force sales. There is not a very good demand from the manufacturers, many of whom are not operating at near capacity and what buying they do is in small quantities. Detroit yards are not stocked heavily and there is little likelihood of prices being further affected.

While the demand from the manufacturers may be said to be uncertain, a little more can be said for the yard trade in building operations particularly in the millwork and finish lines. Business is not rushing but there is a fair demand and prices are stable.

< LIVERPOOL >

There has been a very distinct improvement in the market conditions since the last Liverpool report. The financial position has very materially improved and the impending suspension of the moratorium has not created any nervousness. There may be one or two unimportant failures here, but they will not be serious affairs. Prices of some items have advanced very materially and have a distinct promise of going even higher. Round ash logs are almost sold out and good quality logs should bring higher values for forward delivery. Prime hickory logs are also a good spot, but there is so much poor wood on hand that shippers should be very careful what they send. Good sound oak logs of white texture, and 3" and up thick white oak planks should bring good prices, and some parcels now on hand have been cleared out at very profitable values. The stave market has been cleared out of certain sizes, but shippers should be cautious as to future shipments, and shipments without definite orders are not recommended. Good prices are being secured for stocks now on hand and values will be maintained as long as the war lasts. Naturally there is much speculation as to the length of the war period. Generally the view is taken here that the war will not be a short one and most sound common sense business men think they will be lucky if the war is over in two years.

Furniture woods are still very quiet and in this category, of course, comes mahogany. Prices have remained very stationary and values will probably go lower, as so many people do not wish to hold for higher values. Ash lumber has been moving a little better into consumption, but prices are very stationary and shipments would not come to a good market. Here again there is a large stock which is held by firms not very anxious to hold. It is thought, however, that prices will be better in about a month's time and shippers are advised to await developments.

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—4 1/4 x 8 1/4 inches in size.

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket.

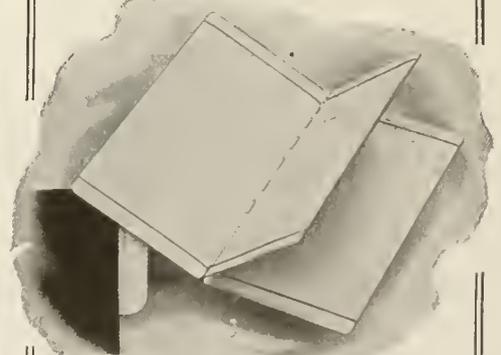

Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired.

Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs. Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability, convenience, accuracy, and for systematizing the inspection and measurement of lumber

Patent applied for on covers. Copyrighted, 1910. Triplicate Tally Tickets patented.

PRICE LIST

Aluminum Tally Covers, each	-	-	\$ 1.00
Aluminum Tally Covers, per dozen	-	-	10.00

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

A Fine Opportunity to Dispose of Narrow, Short and Low Grade Oak

To the oak lumber manufacturer who accumulates considerable oak lumber that can not be sold unless they put a price on it that is so low that there's no money in it, there is now offered a fine opportunity to dis-

pose of this lumber by making it up into oak flooring squares like the illustration.

These squares are jointed together without glue on the

Linderman Automatic Jointer Gluer, Clamper and Sizer

squared to the exact width. A straight tongue and groove is then cut on the two sides and ends.

The demand for these flooring squares is greatly in excess of the present output. Still there are several Southern manufacturers making these flooring squares.

One New York firm wants a good many car loads of the Linderman Flooring Squares. The prices it offers will net you, delivered New York City, practically as much as you are getting from the better grade of oak lumber.

Write today for further information and we will give you the details of the market, manufacturing costs, etc. You're not obligated in any way in asking for particulars, yet it might be of value and worth your consideration.

FAMOUS FOR HARD MAPLE AND GREY ELM

CADILLAC GRAY ELM

was used for finish in the living room of the Michigan-Wisconsin Bungalow at the Chicago and New York Forest Products Expositions.

The wood has an attractive figure, shows delicate shadings, is peculiarly susceptible of color staining, and when properly finished gives a decidedly rich effect.

The lumber is of excellent quality, easy to work, and, unlike other varieties of elm, it does not check, shake, twist or warp more than ash or oak.

It is used extensively for furniture and interior finish.

We will send you prepaid finished samples of Cadillac Gray Elm if you would like to see this beautiful native wood.

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

What Veneer and Panel Consumers Will Use in 1914

This information is shown in our service of veneer and panel consumers' requirements lists—complete according to 1914 requirements.

The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us give you the details.

HARDWOOD RECORD,

CHICAGO, ILL.

American Black Walnut NOW

☐ The time is ripe for consumers of cabinet woods to add American Black Walnut to their line. The leaders in the trade have set the pace; retailers are already stocking up—and are advertising it, and supply and prices are favorable. The war has made it impossible to get Circassian walnut in anything like adequate quantities, and the domestic wood is the logical substitute. Every factor favors the use of American Black Walnut. It's your move! Note stocks, ready to ship, in the hands of leading producers:

LOUISVILLE

THE HARDWOOD GATEWAY OF THE SOUTH

The "Open Sesame" to Hardwood Satisfaction

If you are a buyer of hardwood lumber, whether a wholesaler or a factory man, we have something of interest to say to you. It is not merely interesting in a general way, but it has a dollars-and-cents angle that will appeal to you practically.

We want to show you how to buy lumber in the way to get the most for your money. You know, whether you buy for your own use or on the account of a customer, that there are more things involved in a lumber deal than getting a quotation and signing the order. The most important things come after: first, in the way the lumber is inspected and measured; second, the general condition of the stock, how it has been manufactured, dried, etc.; third, the way the lumber runs for widths and lengths; fourth, the service to the customer in the delivery of the stock just when it is wanted—not too soon nor too late.

In other words, the lumber concern which is worthy of your patronage must do more than sell lumber: it must also dispense satisfaction. And it may be of interest to you to know that lumber buyers of importance are agreed that Louisville, Kentucky, is the most satisfactory hardwood market in the United States.

Think this over and write to any of the firms listed below.

North Vernon Lumber Company
Churchill-Milton Lumber Company
Edward L. Davis Lumber Company
Norman Lumber Company
(Mills at Holly Ridge, La.)

Booker-Cecil Lumber Company
W. P. Brown & Sons Lumber Company
The Louisville Veneer Mills
Stemmelen Bros. & Fullenlove Company

NASHVILLE

THE LOGICAL PLACE TO BUY HARDWOODS

THE following is a list of stocks offered to the consuming trade by the hardwood lumbermen of Nashville. The character of the timber from which Nashville hardwood men secure their stocks places them in a peculiarly strong position as far as quality of lumber is concerned. Nashville lumbermen have always been noted for their strict adherence to all terms of sale, and in short have an enviable reputation for making good both as to the quality of lumber and as to grading.

The members of the Nashville hardwood trade solicit your attention to these facts and an opportunity of demonstrating their truthfulness.

Review and Outlook

General Market Conditions

MONEY seems, without any doubt, to be somewhat easier than it has been on the whole. This with greater activity in stock transactions at a better level of prices shows a more normal trend of thought among the financial men and large handlers of securities, who together do more toward shaping the destinies of business in this country than almost all other interests combined. There are reported considerable negotiations for substantial increases in railroad purchases, although for the most part these have not been actually consummated, and where orders have been placed they are usually for future delivery. However, it will not require immediate purchases on the part of the railroads to effect the desired end. If they should show a disposition to get back into the field, the effect on the whole of our business fabric would be noticeable.

Nothing outside of the general advancement toward the ultimate complete adjustment of the country to present unusual conditions has been noted. The continuance of the war is already beginning to result in our being more or less satiated with war thoughts, the effect being the impression is not so vivid or so startling as it was in the beginning. As week after week goes into history this effect will become more permanent and more favorable in its bearing on our own affairs. If we could all but think business instead of war, nothing further would be necessary toward the establishing of ourselves in a period of unusual prosperity.

It is difficult at this time to see just what effect the surprising results in the recent election will have on business, but it seems likely that any change would be favorable to a degree at least. It is pretty generally conceded that the big business and financial affairs of the country lean strongly to the republican side, and there is an entire likelihood that with the return of the republican faction to a position which gives at least partial control, the big interests will loosen up for political reasons if not because of actual justification. There is a possibility that business men of republican leaning will seize the opportunity of advancing the republican cause by pushing prosperity as actively as possible in order to be able to hold before the people during the next presidential campaign the alluring results of but partial resumption of republican control.

There is no certainty that this would be a wise course, even, of course, if possible, but a normal and natural return to good business would unquestionably be more desirable. We have had too many false starts in the last few years and what we want now is a resumption in normal activity based on a perfectly sound foundation.

There has been within the past couple of weeks a very gratifying return of over-sea business in which lumber has shared to a considerable extent. Shipments from New Orleans and eastern ports have gone over regularly. This is true not only in lumber but in other commodities, and its effect upon the cotton situation has been most helpful. In fact, cotton is now in an easier position than it has been at any time since the opening of hostilities. It is altogether probable that these foreign shipments will increase in frequency and volume gradually as the war goes on. We cannot hope, of course, for export shipments resembling shipments of normal times, but it must be borne in mind that there is at least one favorable feature of the present export situation—that is, in place of the usual balance against this country when all features are reckoned, exports now return a very favorable balance in favor of the United States. In fact, for October the balance was quite astonishing, running well into millions of dollars. When the trade of any country is financially unable to meet its obligations, there is no particular encouragement in selling goods there while payment is not forthcoming. However, this situation will result in big sales abroad and a flow of actual cash to this country as our imports from these foreign customers are practically nil. The result would be that while we are sending our goods abroad in exchange for actual cash we are planning at home to provide for ourselves suitable substitutes for many articles which heretofore we have been importing because of the lack of sufficient incentive to manufacture them at home. The scope and importance of this development is probably not fully realized as yet, but instances are coming up every day to prove that it will be of great importance to American industrial life.

Probably the one thing which has resulted more than any other in maintaining the present depression is our weakened purchasing power which comes as a result of a long period of depression followed by the present abrupt demoralization. To start a general improvement that all will feel favorably, it is only necessary to give employment to those who, because of lack of employment, have been unproductive and nonpurchasing.

In lumber there is not much particularly to be said as to actual changes. As for several months back, the box trade seems to have taken considerable quantities of low grades of various species, keeping that variety of lumber in its position as the best seller. Nothing of import has developed to change the relative strength of demand for other varieties of lumber, and while there is absolutely no future buying or speculation, as consumers cannot be induced to obligate themselves even for the sake of making good purchases under existing prices, there are so many statements of hope for the developments in the near future that they compel attention and belief.

NOV 7 1914

Opening for Woodworking Machinery

MANUFACTURERS OF WOODWORKING MACHINERY in the United States ought to be able to read the signs of the times. They already have pretty complete control of the market on this side of the sea, but there is a large field elsewhere in which gains in trade are possible. The Russians are large users of such machinery, but they are not extensive manufacturers of it. Heretofore they have bought almost exclusively from German manufacturers of such machines. Germany was a near neighbor; the machines were satisfactory; and the Germans pushed their sales successfully. Americans were able to sell some machines in Russia, but no substantial foothold has yet been gained in that country.

A profound change has occurred. It is no fault of American manufacturers that trade between Germany and Russia has come to a standstill; but it would be foolishness not to make the most of opportunities which fortune and misfortune have turned our way. Irrespective of whether Germany wins or loses in the war, it is bound to lose much of its machinery business in Russia. Years will pass before the animosities engendered by the war will die out and trade resume its former channels. Russia is already inviting the United States, in a business way, and our manufacturers and merchants should speedily accept the invitation. The route from San Francisco and Seattle to Vladivostok, and thence across Siberia to European Russia, is open. Russia has called our attention to the fact; and the business men of the United States are welcome to all the advantages of that route while Russia's Baltic ports are closed.

It is an opportunity which may never come again. Many products of the United States will find markets in Russia, and no line has a better opportunity than woodworking machinery. The Russians are large users and they are able to buy. No better machines are made than those which Americans have to offer. When they have gained an entrance they will never lose ground.

The Cover Picture

THERE ARE FEW LUMBERMEN in the hardwood regions of the United States who are not familiar with scenes very similar to that furnishing the subject of the picture on the front cover of this issue of HARDWOOD RECORD. It is not a sawmill or a timber-cutting scene. Nothing in the picture indicates that a sawmill exists anywhere in the vicinity; yet it shows a common situation in many country districts. The fact that it is a common situation makes it interesting. It is not necessary to state the location or give the name of the place. It might be situated almost anywhere east of the Mississippi, north of the Ohio and the Potomac rivers, or it fits conditions very well in many parts of Kentucky, Tennessee, North Carolina, and the contiguous mountain regions, and almost every person acquainted in those parts of the country can recall that he has seen something very like this picture, if not the identical scene represented in this photograph.

It is a hardwood tract, and some softwood trees are mixed with the hardwoods. Such trees resemble hemlock, though they are too far away for that point to be definitely determined, and it does not matter much, anyway. It is autumn—after the first severe frosts and before the first heavy snow. That fact is shown by the few adhering bunches of leaves which are seen on the sour apple tree which perforates the store porch. A snow would have brought the leaves down. The pale shadows falling across the road betray the sun's struggles in shining through haze.

The architecture and surrounding embellishments are typical of the country. The store's "stair-steps" gable is characteristic. It was built with the idea that it was ornamental. The pile of horse shoe kegs is characteristic also. They are stacked out of doors to economize room inside; and their presence, month in and month out, is a commentary on the honesty of the people of that neighborhood. No thief steals them. The picket fence is utilized as a hitching rack for horses and mules; and that, too, is a typical arrangement in country districts. The countrymen who are gathered about the store are posed in slouchy attitudes for a picture. The purpose of the slouch is to convey the impression that he feels perfectly at home in the presence of the photographer who has chanced to pass that way.

Such is the visible situation. The photograph does not show everything. There may not be much that is artistic in the scene. It is extremely commonplace and prosaic; yet it is part of America's rural life. Such places are becoming social and intellectual centers more speedily than one might suppose. The extension of the rural mail routes, with the parcel post added, is rapidly bringing changes for the better in places like this. They used to be loafing headquarters for idlers who gathered there to swap yarns with kindred spirits, with no profit to anybody. That custom is changing. Instead of the arrival of mail once or twice a week as formerly, it now comes every day. People who formerly never saw a daily paper, are now subscribers, and the papers reach them only a few hours after they are in the hands of city subscribers. The farmers are now reading agricultural journals, and their farms show the result; and the women folks and the children have their papers also, and better conditions rapidly multiply in the rural districts, and the isolation of the people is disappearing.

Ramsbaekle, unpainted shanties, like those in the picture, may begin counting their numbered days. They will disappear in the march of better things. The surrounding farmers who drop in there for their daily papers, left by the rural mail carrier, will bring an influence to bear on the storekeeper which will induce him to fix up his premises. He will be persuaded that the "intellectual center" of the neighborhood should put on a better appearance. A hitching rack on the other side of the road will relieve the pressure on the picket fence; two hundred feet of weather boarding and a keg of paint will transform the store front; five hundred feet of good lumber will supply a new porch; and room inside the building will be found for the unsightly kegs of horseshoes.

Your Friend the Tree

SENTIMENT IN BUSINESS is not usually given consideration by the "hard-headed" business man. At least he will not admit that sentimental considerations enter into his scheme of reasoning or influence him one iota in the course he pursues to earn a sustenance. At the same time sentiment actually is a power, the force of which while not discernible or at least not measurable, is existent and is felt in business as well as in social and home life.

Many a lumberman who has, through diligent application and hard work, earned the privilege of comparative inactivity in the administration of the affairs of his business, loves to get back to the mill, and out among the woods operations; he loves to get into his old clothes, to experience again the "feel" of the axe handle, of the rough board, and to sell the fresh lumber as it comes from the "band."

However, if you were to ask him just why he enjoys these trips, he would most likely tell you that he likes to keep in touch with the operations; he likes to know what is going on, and how the boys are making out. But if you were to know his innermost thoughts you would find that those little trips are inspired by sentiment. While he has made his "pile" and is living luxuriously among his metropolitan friends, the call of the woods returns to him frequently. He feels that he must get out into the open. He loves not only the free, healthy life, but he longs for a sight of his trees.

He perhaps was born in the woods, or at least near the woods. He was brought up with the trees as neighbors. As he became older and of greater affluence, he acquired those trees as his personal property, and he has always felt for them a sense of almost personal affection. He has held their ages and their majestic disdain of the petty troubles of man in deep respect, and he has ordered their felling perhaps with an unconsciously felt apology to them for something which the demands of mankind compels him to do against his will.

However, when the exigencies of his new existence call him back to the more artificial surroundings into which he has settled in his later years, the commercial appeal becomes uppermost. In his city office the appeal of the dollar is much stronger in his mind than the appeal of the woods. When a period of depression strikes him he is embarrassed temporarily for want of ready cash to maintain the prestige which he has built around his name. His assets are tied up in lumber, the *remains* of his old friends. He finds his market restricted and weakened, and feeling that he *must* have the cash he gives orders to fell the trees and to meet any price to make sales.

All thought of the sentimental side has left him. He forgets that the tree which produced a couple of hundred feet out of that ear of lumber which he sold for a paltry few hundred dollars, and on which he actually lost money in order to get the ready cash, took two centuries to grow; that it began its life even before the beginning of our country as a nation.

Why can't there be more sentiment in business? If the purely commercial side does not appeal, should we not remember that our forests have been given to us to be used but once? They are not ours for ourselves. We are merely fortunate enough to hold them in trust. Have we then any right to cut trees which everyone, whether he realizes it or not, loves, without at least the excuse of economic necessity? Can we offer the excuse of economic necessity when we actually lose money by cutting them?

Just remember the day when your trees spoke to you as your friends; give them a chance. Reprive the sentence of death at least until such time as the one jury to which you can appeal, the demand of commercial necessity, turns in its verdict that they must be cut.

Until then, you have no justification for putting the axe to a single tree.

A Lesson from Baseball

THE MOST FAMOUS OF ALL BASEBALL CONTESTS, the winter leagues series, is about to open. In fact the box manufacturers are already beginning to feel a marked increase in demand for substantial soap boxes and containers of other products, which would serve as reliable resting places for the persons of those rural fans who in the long, dull winter months exhilarate themselves recounting batting averages, and notable accomplishments of their favorite stars.

During these months when the spiked-shoe and the supple ash are reclining for their well-earned winter's rest, we lose sight of the activities of those who are responsible for the successes and failures of our big league ball teams, but were we to investigate their activities, we would find that they are, (to use the homely, old saying) "making hay while the sun shines." They are building. They are organizing during the period of inactivity. They are looking ahead and providing for the future by acquiring as their employes those men whom they consider will be of the greatest assistance to them in earning for their respective clubs as high a percentage in the league championship races as possible.

Figuratively speaking, the business league season is over. That is, the country is in a period of depression and many a trusted employe is now seeking a means of a livelihood elsewhere.

Admittedly the man with the best organization, the most loyal and most competent employe, is the man who in the end wins. Our most notable captains of industry and finance have demonstrated that the prime essential to commercial success is the ability to pick competent lieutenants. The greatest difficulty, however, is that ordinarily such lieutenants are extremely scarce and hard to entice into the fold.

At present there are thousands of men who are seeking employment because their former employers are simply not financially able to retain them. On the other hand, there are thousands of organizations which are in a position that would enable them to hold on to competent men for a period of unproductiveness of considerable duration. The concern which is in a position to hold those employes whose services it esteems, is also in a position right now to secure the services of many a good man who, when the season of activity again returns, will realize for his employers many times over the cost of carrying him through the present season of depression. That business man who takes advantage of this situation as far as he is financially able to do so, is exercising wise forethought which in the end will produce not merely satisfaction, but actual cold, hard cash.

Working Both Ways

THE UNITED STATES CONSUL at Valencia, Spain, has reported to this government that the business men of that district have sent a commission to New York, Boston, and other American cities to investigate the chances of finding markets here to offset losses of trade in Europe due to the war. The principal product which the Spaniards are anxious to sell is oranges.

Reports very similar in nature come from the different countries of South America. Exports of certain commodities, which had been going to Europe, have ceased or greatly declined, because of the closing of markets there; and the South Americans are making anxious inquiries concerning the possibilities of increasing their trade with the United States.

The Greeks have harvested their currant crop which is extra good this year, but some of the best former markets are not buying currants now, and particular interest is shown in the chances of increasing sales in the United States to recoup losses in the war countries. Greek currants compete in this country with California raisins.

Other similar facts are coming into notice almost every day. People in many parts of the world are anxious to increase their business with America in order to find markets which heretofore went to countries now at war.

The time is opportune. We want new markets for our products, and foreign people want to trade with us. It is a case where we can help them and they can help us. They are as willing to trade with us as we are to do business with them. Old lines of commerce are broken, and in the establishment of new lines we ought to obtain many advantages. If we can trade with the Spanish orange growers, they can buy from us; because foreign trade is nothing more or less than an exchange of commodities. The Greek currant growers can take merchandise from us if we can use what they have to offer. It is the same with the South Americans. They are looking to us for markets, and we are looking to them. When it is to the mutual interest of both sides to exchange commodities, it is very likely to be done. Permanent good to the United States will result if we can attract this foreign business, which is anxious to come, and can get it so firmly established that it will remain with us after conditions in Europe become normal.

An Unwarranted Statement

IN A RECENT ISSUE of a music trades publication was recorded what was stated to be an interview granted a representative of that publication by a prominent piano manufacturer in the East. The interview dwelt mainly on the possibility of American walnut taking the place of Circassian walnut in the manufacture of pianos, due to an admitted probability of a shortage in the latter line. It seemed to him an indisputable fact that the general tying-up of trade movements from European and Asiatic points, which must move across the Atlantic, will cause practically a cessation of shipments of Circassian walnut logs. The only possible result will be the extreme scarcity of Circassian walnut veneers, and hence the deduction, as stated in the interview that there will be room for the substitution of other woods, is entirely justified.

The article, however, contains an imputation as to the physical properties of American walnut, which is not only distinctly unfavorable but is absolutely unbased and inexcusable. It is suggested that this wood has been in ill repute for years because of its extreme liability to check during the manufacturing process, causing a loss which the makers can not meet without placing a higher price on the finished product.

American walnut is universally recognized as being a wood which stays where it is put. It is extremely easy to work, is of fine texture, softness and evenness of grain which would absolutely obviate the possibility of the occurrence mentioned in this interview. It seems strange that a man engaged in the actual manufacture of goods made at least in part from American walnut should let himself be put on record as making such an entirely unfounded statement. It is equally unfortunate that the publication in question would let such a misstatement of fact get by its editorial staff.

American walnut deserves all the good things that can be said about it, and it holds an unique and rather individual position among all domestic woods. It is a wood, the economic possibilities of which were not fully recognized until within the last year or two, and to have a statement of this sort published in a publication that presumably has some influence among possible purchasers, particularly at this time when American manufacturers are making a conscientious effort to secure for walnut the market which it justly deserves, is really an unfortunate occurrence.

World Markets for American Lumber

BY HU MAXWELL

SIXTH ARTICLE

Editor's Note

The proximity of Mexico and Central America to lumber centers in the United States ought to insure a large trade. Railroads connect Mexico with this country, while every republic between our borders and South America has a coast line on one or both oceans, east and west, and sea-borne freight should be landed cheaply. However, that region is not yet a profitable market for American forest products. Poor trade is due to bad industrial and political conditions in those republics. Unfortunately, there seems to be no immediate prospect of a change for the better. That field presents some hard trade problems, and the American lumber exporter has not yet made much progress in solving them. The natives of these republics show little disposition to produce anything to offer us in exchange for our lumber, and foreigners in business in those countries are harassed with so many obstacles that they are seriously handicapped in their efforts to develop trade.

Seven republics and one colonial possession lie south of the Rio Grande and north of South America. They are all occupied chiefly by descendants of early Spanish adventurers, and a mixture of Indians, negroes, and various other nationalities. The countries, with their areas and populations, are as follows:

Country	Area, Sq. Miles	Population
Mexico	767,005	13,606,000
Nicaragua	49,200	600,000
Guatemala	48,290	1,842,000
Honduras	46,250	500,000
Panama	31,531	400,000
Costa Rica	18,400	341,000
British Honduras	7,562	41,000
Salvador	7,225	1,006,000
Total	975,463	18,336,000

The foregoing figures are believed to be the best obtainable at present, and as to areas they are approximately correct; but those showing population are only averages compiled from guesses and estimates. No man knows the population of some of those countries; and an error of thousands either way makes little difference to the man who is looking for a chance to sell lumber in that quarter. The masses of the people are not lumber buyers and will not be until a fundamental change takes place in their habits and resources. The buyers are large companies, generally in charge of foreigners.

It is not necessary to be very particular in speaking of the countries separately, since they are all much alike in prospects and resources. Most of them have been harassed and overrun by civil wars and purposeless insurrections until their available resources have been practically consumed, while efforts to develop their latent resources have been discouraged or frustrated. The two principal exceptions to this rule have been British Honduras and Costa Rica. The British have kept order in the former, while Costa Rica, by a stroke of good fortune, was settled by a better class of people than those who first colonized and exploited the other countries, and the revolution habit has never been popular in Costa Rica, and property and individual rights are respected.

Climate and Resources

The length of Mexico and Central America, from the border of Arizona to the frontier of Colombia, is 3,500 miles. At the widest part the width is half of that, and in the narrowest about fifty miles. The combined area extends from well northward in the temperate zone to within a few degrees of the equator. Altitudes range from sea level to nearly twenty thousand feet above. There are low, hot, damp coasts and plains, and high, dry, and cool table lands. Mountains are many and rugged; valleys wide and fertile. Some of the finest natural scenery in the world is found in that region. Its resources are many, and belong to the temperate zone and the tropics.

Agriculture is developed in spots, but not generally. Coffee, cotton, tobacco, bananas, and farm stock are the principal products; but these do not grow in all parts of the region. Coffee is produced in all the countries, but only in certain districts where heat and rainfall are suitable. Cotton and tobacco each has its regions where the climate suits. Bananas are becoming one of the most profitable crops in parts of Central America. Cattle raising is a profitable industry on the broad Mexican table lands, and in some other regions also; while in certain parts of Central America, cattle raising is next to impossible on account of the red, tailless bats, called vampires, which swoop down

in such numbers as to bleed to death a herd of cattle in one night. Mines constitute an important resource throughout much of the region from the Rio Grande to Panama. During three hundred years the Spaniards and their descendants exploited mines to the neglect of agricultural and other resources of the country. That neglect can properly be named as one of the causes of the deplorable condition which has so long existed in the countries south of us. The mines were a perpetual temptation to those looking for schemes to get rich quickly, and where one person made a fortune, hundreds or thousands were made poor.

Balance of Trade

The foregoing resources constitute the chief means with which Mexico and the countries farther south must purchase from us and other foreigners. The lumber exporter is paid from the proceeds of the coffee crop, the banana business, the mining operations, and the stock ranges. If business in those lines is good, the people will be able to buy lumber and other articles from us. The United States is and always has been a good buyer of all that the Mexicans and Central Americans have to sell. This makes it comparatively easy for them to purchase our products. The most difficult part of the transaction consists in convincing them that they need our lumber. Most of the people of that region have never felt the necessity of using much wood in the way it is used in the United States. They have been able to get along without it. A lot of missionary work will have to be done before the export of timber from this country will reach its proper proportion in the countries south of the Rio Grande. The people there must learn to grow or make something to sell, and must be induced to use more lumber.

Exports Southwards

The best idea of the state of our lumber trade with Mexico and Central America can be obtained by an examination of the kinds and amounts of shipments to those countries. The conclusion may be anticipated by the statement that the whole region between the Rio Grande and Panama, with 18,000,000 people, and an area of nearly a million square miles, apparently does not use as much lumber and other forest products as the single state of Illinois. There ought to be a field for enlarged trade in that direction. The following statistics of exports for 1913 are presented for the benefit of exporters and prospective exporters who may be interested in knowing where and in what quantities shipments are going to the countries south of the Rio Grande.

ROUND LOGS

British Honduras and Guatemala each bought 1,000 feet of round oak logs from American exporters in 1913; Panama bought 40,000 feet, and Nicaragua 49,000. Mexico purchased 34,000 feet of walnut logs, and all other round logs to those countries are shown as follows:

	Feet
Mexico	15,630,000
Panama	7,577,000
Honduras	213,000
Costa Rica	191,000
Guatemala	109,000
British Honduras	41,000
Nicaragua	4,000

Total purchases of round logs by all the countries, 23,890,000 feet.

SAWED TIMBER

Below are figures showing the exports of sawed timber, most of which was yellow pine:

	<i>Feet</i>
Mexico	14,688,000
Panama	503,000
Honduras	81,000
Costa Rica	62,000
British Honduras	30,000
Guatemala	16,000
Total	15,380,000

SAWED LUMBER

Both hardwoods and softwoods are included in the lumber exports to Mexico and Central America, but the softwoods are sent in much larger quantities. Oak and red gum are the principal hardwoods in that trade. The purchases of gum in 1913 by Nicaragua amounted to only 1,000 feet, and Mexico bought 58,000. The purchases of oak follow:

	<i>Feet</i>
Panama	443,000
Nicaragua	172,000
Honduras	8,000
Mexico	7,000
Guatemala	5,000
Total, oak	635,000

LONGLEAF PINE

	<i>Feet</i>
Panama	20,552,000
Mexico	18,995,000
Honduras	3,843,000
Costa Rica	3,587,000
Nicaragua	689,000
British Honduras	625,000
Total	48,291,000

CYPRESS

	<i>Feet</i>
Honduras	637,000
Panama	265,000
Mexico	155,000
Nicaragua	18,000
British Honduras	18,000
Guatemala	12,000
Costa Rica	9,000
Total	1,114,000

DOUGLAS FIR

The Pacific coast of the United States ships Douglas fir to the countries which front on the Pacific ocean. That includes all of them. There is not an independent country from Panama to the Arctic ocean which has not a coast on both the Atlantic and Pacific, except Salvador, which fronts on the Pacific only.

	<i>Feet</i>
Panama	14,729,000
Mexico	14,058,000
Salvador	646,000
Guatemala	554,000
Costa Rica	220,000
Honduras	104,000
Total	40,311,000

WHITE PINE

	<i>Feet</i>
Mexico	17,277,000
Salvador	184,000
Panama	85,000
British Honduras	35,000
Costa Rica	9,000
Total	17,590,000

Shortleaf pine lumber was bought by only three countries, but the total was comparatively large. Salvador took 7,000 feet, Panama 54,000, and Mexico 29,010,000.

OTHER YELLOW PINE

This wood listed in our exports to Mexico and the Central American states is various yellow pines which are not specifically named, but consist of several species. The shipments in 1913 were as given below in feet:

Mexico	26,845,000
Honduras	1,814,000
Panama	1,523,000
British Honduras	1,218,000
Nicaragua	381,000

Guatemala	181,000
Costa Rica	43,000
Total	32,005,000

REDWOOD

Shipments of redwood go southward-by-water from California, and the totals for 1913 in feet are shown below:

Mexico	1,504,000
Panama	830,000
Guatemala	386,000
Salvador	36,000
Honduras	23,000
Costa Rica	7,000
Total	2,786,000

ALL OTHER LUMBER.

Ten thousand feet of spruce and 269,000 of yellow poplar were sent to Mexico, and the following shipments of other woods were reported:

	<i>Feet</i>
Mexico	3,772,000
Honduras	217,000
Salvador	22,000
Panama	18,000
Guatemala	8,000
British Honduras	5,000
Total	4,042,000

The whole export of lumber from the United States to Mexico and Central America last year amounted to 144,178,000 feet, and of round and square logs 39,269,000 feet. There were shipments of other forest products. Mexico bought 9,262,000 feet of joists and scantling, and Panama 33,000. The purchases of shingles from the United States by Mexico totaled 4,684,000, Panama 116,000, Guatemala 54,000, Honduras 48,000. Nine shingles are approximately equivalent to one foot of lumber.

RAILWAY TIES

Last year we sold railway ties to the countries south of us as follows:

Mexico	685,594
Panama	244,477
Costa Rica	87,971
Honduras	71,043
Guatemala	47,928
British Honduras	6,325
Salvador	5,000
Nicaragua	1,185
Total	1,149,523

A railroad tie is equivalent to thirty-two feet of lumber.

COOPERAGE

A fairly large quantity of manufactured products of wood is exported to the countries south of us. Most of the lumber is used in the rough for bridges, trestles, mine buildings, wharves, warehouses, and the like. When manufactured wooden articles are wanted, they are generally purchased ready made, because facilities for manufacturing are not the best in those countries. Ready-made barrels were last year bought as shown below:

	<i>Value</i>
Mexico	\$116,729
Panama	12,378
British Honduras	1,765
Honduras	724
Nicaragua	161
Guatemala	42
Total	\$131,799

Mexico imported our staves and barrel shooks to the amount of \$216,087, Panama \$1,209, Honduras \$176, and Nicaragua \$100. In the group classed as "all other cooperage," we sold Mexico \$72,467, Panama \$25,280, Nicaragua \$1,177, Guatemala \$803, British Honduras \$852, Costa Rica \$375, Salvador \$5.

The export of box shooks ought to become a large part of your business with these countries in course of time. Fruit and vegetable shippers will need them. The number of box shook exported last year to Mexico and Central America is given below:

	<i>Number</i>
Mexico	4,565,969
Panama	54,472
Costa Rica	26,288

Honduras	3,200
Salvador	1,000
Guatemala	600
Total	4,651,529

BUILDERS' MATERIAL

Various kinds of building material and supplies are exported to those countries from the United States. In the following tables the values of such exports are shown in dollars:

	Furniture	Doors, Etc.
Mexico	\$536,294	\$11,667
Panama	130,206	20,108
Costa Rica	34,872	4,267
Guatemala	30,745	5,204
Honduras	19,904	4,861
British Honduras	14,519	3,589
Nicaragua	12,519	1,895
Salvador	10,234	971
Total	\$789,493	\$52,562

Our exports of other commodities are given in the table which follows:

	House Finish	Woodenware
Mexico	\$21,751	\$ 4,784
Panama	10,220	2,037
Costa Rica	1,990	1,432
Guatemala	1,628	370
British Honduras	1,103	936
Honduras	942	1,392
Nicaragua	860	284
Salvador	67	50
Total	\$48,561	\$11,285

OTHER WOOD MANUFACTURES.

Mexico	\$324,866
Panama	68,202
Honduras	29,786
British Honduras	16,926
Nicaragua	15,337
Guatemala	11,610
Costa Rica	9,095
Salvador	1,525
Total	\$477,647

Native Timber

The timber which grows in the regions between the Rio Grande and Panama will compete with shipments from this country, so far as the kinds are similar. There is more pine in those republics than in the West Indies, but otherwise the forests are very similar. That is particularly true of the Central American states and the West Indies, and what was said in a former article concerning the timber resources of those islands applies very generally to Central America. Mexico is somewhat different because of its topography and its dryer climate in some parts. The country consists largely of high plateaus and mountain ranges where rain at certain seasons is scanty.

Outlook in Mexico

The opinion is generally held and is probably well founded that a change for the better will come before long in Mexico, either by the disappearance from the scene of the quarreling politicians, or their suppression by a strong arm. It is certain that the country's tangible resources have been so abused and wasted during recent years of internecine strife, that when peace comes, a serious search will begin for something to sell in order to patch up the broken fortunes of the government and the large property holders. The fortunes of the common people who had little to lose will not be much affected by the war one way or the other. Their labor will be about all they will have to sell, as it was before the trouble began.

It is usually considered that next after the mineral lands, Mexico's timber will be the largest resource that can be quickly converted into cash. It has been seriously asked whether the rapid conversion of that stumpage into marketable products may not upset the markets in the United States. The fear that such a thing might occur is not lessened by the unknown quantity of timber that might be cut. People are often more scared at what they cannot see than at what is apparent.

This holds for Mexico's timber situation. There is a lack of exact information concerning the forests of Mexico; but they are not

extensive enough to scare anybody on account of their size. The latest report covering that subject seems to have been published four years ago in "The Forest Resources of the World," by Raphael Zon, who complains that the report is based on meager information.

According to that, the timbered lands of Mexico embrace from 20,000,000 to 25,000,000 acres, consisting of pines in the North and hardwoods in the South. The southern forests are more than two thousand miles from the northern, and most of the timber is inaccessible at the present time. A cruise of a tract of 1,000,000 acres furnished the only basis for an estimate of the remaining areas. That cruise showed an average of 8,000 feet per acre, and it was believed that was above rather than below the average for the country's whole timber area.

That would place Mexico's whole supply of standing timber at 200,000,000,000 feet, or less. That is less than one-half of the quantity of the single species Douglas fir in the United States. It does not exceed the standing oak in this country. It is little more than half of California's timber, about half of Washington's, little more than one-third of Oregon's. It is less than the stand of long-leaf pine alone in the South.

The pine is usually of good quality similar to that commonly called California white pine or western yellow pine. There are several kinds of pine among the mountains of Mexico. In the southern part of the country there are many hardwoods and some softwoods. Mahogany, prima vera, and Spanish cedar are the best known.

The lumber business in Mexico four years ago was ridiculously small, and it is probably smaller now. The whole annual output in Zon's report was placed at 225,000,000 feet, board measure. That is less than the product of the little state of Vermont, and only one-tenth that of Mississippi. It is apparent that lumber will have to come out of Mexico at a much faster clip than that to have much effect on the markets of the United States. A couple large mills of Louisiana or Washington will cut more lumber than was reported annually from the whole of Mexico.

If peace is restored in that troubled country and business opens up, it will have an effect on the lumber business of the United States different from what some have apprehended. Instead of flooding this country with Mexican lumber, that country will buy from us. Four years ago the Mexicans were importing from this country three-fourths of all the lumber they were using. They could not supply even their own people with lumber, but came to the United States for it.

They are not users of wood. Anyone who ever had a single glimpse of a Mexican town or ranch does not need be told how small the market is for lumber. They would rather live in a mud house than take the trouble to procure lumber; and the ranch of 10,000 acres usually has about as much fence on it as the ordinary ten-acre Indiana farm. Most of the wood used in Mexico is bought by foreigners for railroad building, oil well development, mine improvements, and the like, while the typical native's purchases are nil.

With the restoration of peace, if it is the kind that investors have confidence in, there will be a good trade in lumber between the United States and Mexico; but the most of the shipments will go south, not north.

Means of Communication

South of Mexico the means of communication are poor. This applies both to sea and land. In normal times ships are not numerous in those waters. Of course, vessels with cargoes for certain ports go and come as business calls, and on the east side the fruit steamers carry out pretty regular schedules, but travelers on the west side miss many connections which look easy in the printed time tables, but are often woefully out of joint in practice. A wait of two or three days for a boat, after it is due, has been described as a common incident of travel in that region; while annoyances and delays which beset the traveler at the custom houses are said to be enough to break the patience of Job. The commercial travelers who make regular trips in those countries have learned to discount such annoyances and delays, and to endure them with stoical patience; but the newcomer who is making the rounds for the first time has experiences which he will not soon forget.

It is often worse inland than on the coast. In some of the countries,

wagon roads are practically unknown. What little merchandise is taken inland is carried on mules. Of course, the importation of lumber is out of the question in places like that. From 1907 to 1909 the town of Tegucigalpa in Honduras, with 35,000 inhabitants, had only one visit from a commercial traveler, and he had whisky to sell. A mule path a hundred miles long is the only avenue of communication with the outside world; and that is not a solitary instance. There are many like it all over Central America. There is no earthly show of selling lumber, furniture, farming implements, or other forest products under such circumstances.

There are, however, some railroads in Central America, and there are harbors where vessels may land cargoes. Likewise, there are rivers by which freight is carried by boats to the interior.

Business Attitude of the People

Most business in Central America is done on a small scale. There are many natural resources in those countries, but the natives show little disposition to develop them. In some instances, foreigners long ago would have carried out works of development, but for their fear of investing money where danger of confiscation was so great. In some of the Central American countries every conceivable line of business has been sold by the government as a concession or monopoly, and the holder in many cases is concerned only in squeezing as much money as possible out of the business in the shortest time. It is not so bad in other parts of the country; but considering the resources of the region, very little development is being carried out.

In some of the states, revolutions and tyrannies are chronic. There is no encouragement under such circumstances for persons to engage in honest business. They have no chance. For that reason, some parts of Central America are very poor while the resources are in sight to make them very rich. Sales of lumber under such circumstances must be limited. This is forcibly brought out by the statement that the annual sales of lumber and timber of all kinds, including railroad ties, in the whole region from the Rio Grande to Panama, are smaller than the sale of longleaf pine alone to the single country, Argentina. It would seem that there ought to be room for increase in lumber sales when such a showing as this is made. These countries, lying at our very border, and enormously rich in natural resources, are not able and willing to buy as much lumber as a single farming country five thousand miles farther away.

Financial Condition

Everybody knows the financial situation in Mexico. It would not be fair to say that all Central America is like it, but some of it is even worse. Some of those countries have defaulted in the payment of interest on their national debts. In some cases not a cent of interest has been paid for thirty or forty years; others are not so much in arrears. The bad situation in most instances is due to graft and extortion on the part of officials in past time. One of the republics borrowed \$100,000,000 for railroad building, and when fifty-seven miles had been built, the money was all gone. That is an example of high finance in some of those countries. The paper money is so depreciated that it is worth little more than Confederate money in the spring of 1865. The purchasing power of the people is necessarily low. They sell coffee, bananas, some cotton, ores and minerals, hides and horns of cattle, and some cabinet woods. They might increase their exports enormously, and thereby augment their purchasing power; but little tendency in that direction is observable.

Following are the origins of the names of some of the countries south of us: Mexico is the native Indian name for the country, originally written "Mejica." An American hearing the name pronounced in that country would suppose that the native was trying to say "Michigan."

Nicaragua is named for a native Indian chief Nicaras.

Salvador is Spanish for Savior.

Costa Rica in the Spanish language means "rich coast."

Honduras means "fathomless," so named because the sea is very deep off the coast and the Spanish explorers had difficulty in finding anchorage for their ships.

Guatemala is an Indian word which has been translated "land of forests."

Yucatan is an Indian term meaning "I don't understand." When

the Spanish discoverers asked the Indians the name of their country the reply was "Yucatan," which the explorers supposed was the country's name.

Many valuable books on Mexico and Central America have been published. Those who wish to obtain general idea of the countries and the people in a short time might begin with "Mexico in the Twentieth Century," 2 volumes, 1907, by Percy E. Martin, an Englishman; and "Central America and Its Problems," 1909, by Frederick Palmer. Mr. Palmer's book contains few statistics, and mentions trade only incidentally; but it describes conditions in a manner which leaves an impression on the reader. An extract from Mr. Martin's work on Mexico will indicate his manner of presenting his subjects:

"There is scarcely a private office, bank, or public building which one enters which does not contain obviously American furniture; for its mathematical angularity and generally unattractive appearance are unmistakable. Thousands of rolltop desks, revolving chairs, tables, bookshelves, settees, sofas, and rockers find their way into Mexico from across the border, in spite of the heavy duties which are imposed. Chairs, beds, dressers, and bedroom tables cannot, however, enter on account of these duties, and the consequent high prices at which they are retailed. Quantities of good agricultural implements are being introduced into Mexico, the more intelligent among the hacendados at length consenting to purchase after years of persuasion. American light-bodied carriages are also becoming popular, as are a certain number of American automobiles, although the favorites among the wealthy classes are still those of French, Italian, and British make."

Oak in the Furniture Trade

Oak always has been and always will be an important item in furniture making. Still one can hardly go through a furniture exposition or make a round of the displays in the show windows without being impressed with the idea that oak is being overshadowed more than it should by other woods which have come into favor lately. As one student of the situation puts it, it looks at times like oak has stood by unobtrusively and let other woods run away with a large share of the furniture trade. Among the features of late furniture shows have been walnut as perhaps the newest thing in prominence, and prior to this mahogany was a favorite, followed by Circassian and figured gum. Birch, too, has been more in evidence lately, and all around there is evidence of bringing to the front other favorites, with oak manifesting a sort of modest or retiring disposition.

There is oak in evidence, of course; there always has been and always will be. Some beautiful effects are seen—some in period stock with brown stain and some with grey, some plain and some quartered—but for all that oak is not nearly so conspicuous in the furniture trade as it has been at times in the past. No one feels inclined to find fault with other woods for coming into favor and capturing their share of the trade. We have many excellent native cabinet woods and the list of attractive imported woods is increasing right along. These things are as they should be, too, for we need the variety in the furniture and cabinet trade and we can take care of even more variety in attractive woods. All this, however, doesn't mean that oak should take a back seat and veil itself with the obscurity of the onlooker instead of being an active participant. Oak is really entitled to a bigger and better place in the furniture world.

Persistent concerted effort at exploitation has helped materially in popularizing other woods in the cabinet world. This exploitation has taken on various forms and in some instances the work of exploitation here has overshadowed the oak boosting. This suggests that those interested in the promoting of oak may make a bigger and more conspicuous place for it in the cabinet world and also in interior trim by more attention to exploitation. There has perhaps been too much assuming that oak is so well known and its qualities are so thoroughly established that it needs no one to speak for it and no special advertising or exploiting. Logic of this kind might have applied with some force in the days gone by, but in this day that which is not persistently exploited and brought to the attention of the public in new lights from time to time is soon forgotten and generally neglected. This may well be given consideration by those interested in oak and desirous of seeing it occupy a more prominent place in the furniture trade.

Wood Ashes as a Resource

Editor's Note

Few persons are accustomed to think of ashes as a forest product worth considering. While the ash remaining when wood is burned is an asset of minor value in comparison with what lumber is worth; yet, since it is usually regarded as waste pure and simple, utilization, even in a small way, should be encouraged. Several interesting matters are connected with the by-products which become available when wood is burned. Ashes, charcoal, and in certain cases, even smoke are of commercial value. The following article is devoted to ashes, and deals chiefly with present conditions and future prospects, though brief references to statistics and past uses are included.

When wood has been reduced to ashes it is generally considered that the waste is absolute, yet that has not always been the case, nor is it the case now. An English newspaper recently printed as a curiosity "an ash burner's will." The man who made the will died some 250 years ago, and left ash houses, ash ovens and the like, to be divided among his heirs.

There should be no mystery about the occupation of an ash burner, neither in England nor in America. Wood ashes and their products were once common commodities and to some extent they are commodities yet. The value of the trade is not so large as formerly, but wood ashes are not a waste product, though in most instances they are wasted.

When wood is burned, the remaining ash represents what the growing tree extracted from the soil, while the smoke that goes into the air represents what the tree derived from the atmosphere. The charcoal, if sufficiently burned, disappears. A small portion of a tree comes from the soil and much from the air. Some trees do not take one pound from the soil to one thousand pounds from the atmosphere, while others may take one from the soil for fifteen or twenty from the air.

EARLY TRADE IN ASHES

When English colonists settled on the Atlantic coast from New England to North Carolina, the abundance of wood suggested to them that there might be profit in the sale of ashes. In 1621, less than fifteen years after the founding of Jamestown, the Virginians were selling ashes at from thirty to forty dollars a ton for export to England. Wood was cheap in Virginia. It could be had for the cutting; yet, it is doubtful if ashes could be burned at that price, if carried on as a business. What was sold must have been scraped together where log heaps were burned in clearing land, or from ash dumps near residences where the open fire places consumed wood by the cord. An early law required the colonists to collect ashes from the clearings. On page 151, vol. I., of Hening's "Statutes at Large," Virginia, this law is recorded:

"Every master of a family within the several plantations of this colony shall use their best endeavors to preserve and keep in dry and tight houses or casks all those ashes which shall proceed and be made by the wood that is burned in clearing their grounds, that they may be ready at all times to be delivered to those who shall require the same to make experiments thereof."

Hickory was then abundant in Tide-water Virginia, and was the best wood for fuel. It is high in ash, and in the burning of thirty-five cords, about one ton of ashes could be secured. In the large fireplaces and open cabins of that time, an average family probably burned that many cords a year; but if the fuel were pine, at least 100 cords had to be burned to secure a ton of ashes.

In the region now comprised in the states of Maine and New Hampshire, a large business was carried on in wood ashes about 1670, and to some extent it has continued until the present time.

DOMESTIC SOAP MAKING

Without wood ashes, the domestic soap supply during the past 3,000 years would have been in a bad way. In the first half of the nineteenth century in Canada there were communities which had little income except from ashes or potash sold. It is evident, however, that their income was generally small.

The burning of ashes was a favorite business undertaken by negroes who had run away from slavery in the South and had settled in Canada. No capital was required, as wood was free; and, though the income was small, the work was easy and served to attract a good many people. As late as 1898 Canada exported annually 1,323 barrels of potash and pearl ash, the equivalent of

more than 20,000 barrels of ashes. According to L. A. Groth's book, "The Potash Salts," published in London in 1902, the imports of Canadian ashes products were used in making soap for the British navy.

A century ago eighty per cent of the potash shipped from New York and Boston was made from sugar maple wood.

THE UBIQUITOUS ASH HOPPER

The bulk of wood ashes employed in soap making during pioneer times, and even more recently, is not shown in published statistics. Nobody thought it worth while to compile figures on so common a subject as soapmaking in the back yards of farm houses and village residences; yet there was no domestic industry more universally followed. Every family made its own soap, as it made its own clothing and shoes. No expert knowledge of chemistry was necessary to make a kettle of soap, as it was done in rural communities up to half a century ago. The art is not yet lost in some localities.

In anticipation of soapmaking day, wood ashes were shoveled from stoves and fireplaces during the winter and were collected in barrels and bins. Grease and fat from the kitchen and smoke house were laid aside to be ready when wanted.

The ash hopper or ash gum was always in evidence. It was a necessary article in practice, but it was not a thing of beauty, though it usually occupied a conspicuous place, often "between the house and the big road."

During the first warm days of spring, the winter's accumulation of ashes were deposited in the ash hopper and water was poured on until the whole mass was thoroughly soaked.

The lye, which is a caustic liquor of a color resembling red wine, was drained into a trough. For boiling, it was placed in large iron kettles, grease and other necessary ingredients were added, and a couple hours of boiling completed the work.

A prevalent superstition required that soap, while boiling, should be stirred with a sassafras stick. Commercial soap makers took advantage of that conceit and scented their soap with sassafras oil, seeking thereby to convey the impression that it had been stirred with a sassafras stick. It is needless to say that all the odor which could be imparted by stirring with a sassafras stick would not be noticeable.

ANTIQUITY OF SOAP MAKING

As an interesting commentary on the use of wood ashes in soap-making, a curious description is quoted below from an epic poem believed to have been composed in Finland 3,000 years ago. The quaint account shows that family soap was made then almost precisely as it was made in America up to fifty years ago. The Finnish poem is known as the "Kalevala," and was the model followed by Longfellow in writing "Hiawatha." In the following extract from the old epic a blacksmith is giving orders:

"Fill with heat the honey chambers,
Lay the faggots on the fireplace,
Lay the smaller woods around them,
Pour some water through the ashes,
Make a soap of magic virtue
Thus to cleanse my blackened visage."
Then Annikki, kindly sister,
Quickly warmed her brother's bathroom,
Warmed it with the knots of fir trees
Which the thunder-winds had broken;
Gathered pebbles from the fire-stream,
Threw them in the heating waters;
Broke the tassels from the birch trees,
Steeped the foliage in honey,
Made a lye from milk and ashes,
Made of these a strong decoction,

Mixed it with the fat and marrow
Of the reindeer of the mountains,
Made a soap of magic virtue,
Thus to cleanse the iron artist.

The foregoing might as well have been written thirty instead of three thousand years ago, there being so little change in process in that long time; except that milk and honey are not now soap-making ingredients.

“POHICK SALT”

Wood ashes are little used now as meat preservatives, because better methods are available; yet in former years that was the common way among farmers. It is said the Virginia settlers learned it from Indians who preserved meat by covering it with ashes. Early travelers have left record that Indians on the coast of Maryland, Virginia, and North Carolina employed hickory wood ashes as salt. It is not likely that the use of ashes was for flavoring, but for a preservative. The white people adopted the method, and called hickory ashes “pohick salt,” the word pohick being one of the Indian names for hickory. There is a village in Fairfax county, Virginia, called Pohick to this day.

Up to a few years ago ashes were occasionally used by farmers to preserve bacon. After it had been salted and smoked, it was placed in a trough and covered with ashes. There it remained several days, and was then taken out and the ashes brushed off. The application of ashes was for the purpose of killing or driving away the colonies of lepidopterous insects which infest bacon, and are popularly called skippers.

Orchardists formerly employed wood ashes, or lye obtained from them, to kill insects injurious to fruit trees. The most common enemy was the borer which tunneled under the bark near the roots of young trees. A quietus can be put on his activities by a liberal application of lye.

FERTILIZING THE SOIL

The largest use of wood ashes in this country has always been in fertilizing the soil, and that will doubtless be the most practical employment of this commodity. Sales of ashes as fertilizers do not seem to date very far in the past in this country. Farmers and gardeners used their own to enrich their land. The leached dumpings from ash hoppers were as good as any. It is said that Indians in New England taught the settlers the value of ashes on exhausted soil. However, it scarcely seems credible that the fact was not known long before that time, since primitive agriculturists must have observed it hundreds of times.

It was early noted that cucumbers, melons, and pumpkins planted where log heaps had been burned were generally exempt from attacks by beetles, which are apt to destroy the young plants in other situations. The popular notion is that the plants growing in ash beds take up lye and other ingredients from the ashes, and their leaves and stems are so filled with the distasteful substances that the bugs will not eat them. The real reason is probably different. The beetles that prey on the plants' young leaves are accustomed to bury themselves in the soil near the plants' roots most of the time, coming up occasionally to feed. The soil which is rank with ashes is uncongenial to the burrowing bugs, and they seek new pastures, and the vines are spared.

FERTILIZING INGREDIENTS

The fertilizing value of wood ashes is due principally to the potash and other ingredients they give the soil. Potash may run six per cent, phosphoric acid two per cent, lime thirty-two. These amounts and ratios are not constant. The soil on which a wood grows is influential in determining the proportionate amounts of fertilizing elements incorporated with the ground. Trees occupying salt marshes do not yield ashes satisfactory as fertilizers, because of the presence of salt in the ashes. Considerable quantities of dirt of different kinds are often present in ashes sold in the market. The dirt is not a part of ashes, but is due to methods of gathering from ash heaps. Leached ashes are often one-third water.

The potash in wood ashes is taken up by the soil more readily than in most other forms, because the grains are generally extremely fine and the minute particles are easily distributed through

the soil in convenient form for assimilation by plants. When tan-bark is burned, the ash is poorer in potash and phosphoric acid than wood ash, but may be richer in lime.

ANNUAL CROP OF ASHES

No one knows how much wood ash is used yearly for fertilizing and for other purposes in the United States. Records are not kept, and figures are not obtainable. The amount of such saving is large, but the waste is more. Few persons save ashes, even when it would be quite convenient to do so. Waste is everywhere that wood is burned; where land is being cleared of logs and brush; where open fireplaces and stoves consume fuel; where mills and factories use wood to generate power; where brick-kilns, potteries, and other wood-burning plants are in operation. Now and then a wagon load or a car load is collected and sold, but such is not the custom.

The quantities of ash which different species of wood contain, have been determined experimentally. Figuring on the basis of ninety cubic feet of actual wood per cord, and on wood oven dry, the following table gives the weight of a cord and the weight of the resulting ash when the woods are burned. The table lists twenty-five kinds of wood:

ONE CORD OF OVEN DRY WOOD

Species—	Weight of Ashes, lbs.	Weight of Wood, lbs.
Douglas fir	2	2,892
Sassafras	3	2,827
Red cedar	4	2,763
White pine	4	2,161
Wild black cherry.....	5	3,265
Yellow poplar	5	2,372
Longleaf pine	10	3,929
Basswood	14	2,538
Sycamore	15	3,184
White ash	15	3,669
White oak	17	4,171
Red gum	20	3,314
Beech	21	3,860
Locust	21	4,113
Sugar maple	21	3,877
Cottonwood	21	2,181
Sweet buckeye	25	2,514
California sycamore	30	3,736
Black walnut	31	3,429
Slippery elm	32	3,901
Shellbark hickory	34	4,695
Mesquite	92	4,241
Persimmon	158	4,744
Mastic	291	5,670
Guiana plum	434	5,241

It is apparent that the weight of wood is of little value as a guide to the quantity of ash which the wood contains.

SOME POSSIBILITIES

Slabs and edgings now thrown away may be sufficient to produce 50,000 tons of ashes annually, calculated on figures given in Louis Margolin's "Waste in Milling."

Figured on the same basis, ashes from sawdust would total 500,000 tons a year. Cordwood now burned as fuel would be good for 500,000 tons, making a total of more than one million tons of ashes annually, little of which is now saved.

This is all theoretical. The practical problem of getting this material burned, and saving and selling the ashes, is not touched. Neither is the further reduction of the ashes to potash—the form in which the product is salable—given consideration. The problem is stated merely as a possibility. Practical methods of securing results remain to be worked out. Some factories which manufacture fertilizers buy wood ashes.

It has been suggested that this country can produce its own potash to make good that cut off by the closing of the German trade. We have been getting about 250,000 tons a year from there. If an attempt is made to convert ashes into potash, we might figure that six pounds of ashes will make one pound of potash. A million tons of ashes would be good for 150,000 tons of potash, or rather more. At recent market prices it would be worth \$12,000,000. It would be worth twice that at present quotations, but the usual price is about four cents a pound.

The Lumbermen's Round Table

The Silver Lining

A prominent walnut man who recently thought that things had gone against him pretty badly because a lot of his logs were tied up in Hamburg with no prospect of getting out, is now feeling much more cheerful over the situation. The price of walnut, as well as other hardwoods, is going up over there, because the wood is needed for military purposes by the German government, and is going to be bought at a figure which will provide satisfactory recompense for the delay that has been involved.

From various sources there are indications of a demand abroad for walnut, ash, hickory and poplar, all of which are needed in large quantities for military supplies and operations. The inquiries will probably come in a roundabout fashion, but there is no doubt that the need is developing, and that the combatants are looking to America to supply the material.

One Phase of Contract-Breaking

It is a remarkable thing that many business concerns feel no compunction over breaking a contract to take lumber if they find that they can buy it in the open market at prices lower than they had agreed to pay to the contractor. Many reports have been received from hardwood concerns indicating that the proportion of consumers who are willing to resort to this method of making money, and to admit it, quite frankly, is very large.

There is more than the mere moral aspect of the situation, though in a large sense this is the most important fact developed. The thing to remember is that the concern which agrees to take say ten cars of hardwood lumber usually gets a material reduction in the price compared with the buyer who wants only one. If, after taking in one or two cars on the contract, the customer refuses to accept the remainder, and violates his contract, he is picking the pocket of the seller to the extent of the difference between the price of lumber in single carlots and the price on the ten-car order. That is one way of "beating the game," similar to the old gag of asking for a "sample car," but it should not commend itself to houses of any standing or pretensions to class.

Incidentally, the concern which lives up to its contracts soon gets a reputation for so doing, and lumbermen make concessions in its favor. A certain large concern in the store equipment field has inconvenienced itself on several occasions by taking lumber which it had contracted for but did not need at the time. The result of this policy, however, is reflected in the rock-bottom prices that are quoted it, and the general disposition of the lumbermen to give it the cream of the stock. Such a plan pays and pays well.

The Good Inspector

What makes a good inspector of hardwood lumber?

In the first place, of course, knowledge of the rules is one of his attributes. After that come reliability and willingness to work, but probably the quality that should stand out most prominently in the make-up of the inspector is steadiness and judgment. The man whose cars are uniform, and who doesn't vary widely from day to day, is a good inspector. On the other hand, the chap who will be hard on the lumber today, because he feels that way, and easy tomorrow, when his digestion is working better, is a very unsatisfactory employe.

"That inspector is too erratic to fool with," declared a lumberman regarding an employe of a large woodworking concern which is an important buyer of hardwood. "As long as he is there I am not going to solicit their business. Some days he lets anything get by, and on others he calls every other board a lower grade than it really is. It's too expensive to be constantly arguing technical points, and until a new inspector is put in charge we don't want that business."

This may be a case of passing up orders without due cause, and may hurt the lumberman; but it hurts the consumer also to have that kind of reputation about his organization get out, and suggests that the job of inspector is more important, in its effects, than some lumber buyers seem to think it is.

Automobile Dimension Stock

A good deal of dimension lumber is purchased for use in manufacturing motor cars, and concerns which handle woodwork for automobiles are frequently inquiring for stock cut to size for use in their operations, realizing that they can save waste and freight bills by buying that way. A large manufacturer of this class of goods recently asked dimension houses for quotations on 6,000 boards, 4 feet long by 10 inches wide, of good ash or oak, for use as automobile running boards. The material was to be clear, though a good No. 1 grade could be used.

Motors in Wholesale Yards

One advantage of having some sort of equipment for remanufacturing lumber in a wholesale yard is that a lot of this work can be done during idle times when it would be necessary otherwise to let the men go. A large hardwood concern which has a motor-driven saw in its yard is putting in a good deal of time at present having boards worked over and defects cut out, the work being a good investment of time and labor, since the grade of the lumber is raised, and the sawyer is kept on the job when ordinarily it would be necessary to let him go. In yards of this kind the plan is usually to work the stock when it is received; but sometimes with a lot of lumber coming in all of it cannot be given attention, and the work is done as the stock is loaded out. At present much of the time is being put in in sawing up broken boards, sticks and scraps for sale as baker-wood, a considerable revenue being realized, and the yard being cleaned up at the same time.

Do You Enjoy Your Work?

The only happy man is he who likes his business, and revels in his work. If you are discontented with your lot, and feel that you are in the lumber business simply because you can make a living out of it, you are extremely unfortunate. On the other hand, if you find things to be keenly interested in, entirely apart from the commercial angle of the proposition, you are going to take enjoyment in carrying on your business. That is the ideal condition, and it is not only one that makes for personal happiness, but for business efficiency. The sawmill operator who is interested in making his mill do the best possible work, for the sake of the work, will produce the best lumber at the lowest cost. The cheerful, interested man can always get better results than the grim-visaged grouch, who imagines that having to work is a punishment, instead of being one of the greatest blessings imaginable.

The capacity to take interest in everything pertaining to one's business is one of the requisites of a good association or club member. The man who has enough breadth of vision to see what can be gained by co-operating with others is always enthusiastic over organization effort. The sort who thinks that business of all kinds is a bore wants as little to do with his fellows as possible, and consequently can see no advantage to be gained from meeting them in local and sectional and national organizations.

The Discount Hog

In spite of all that has been said and written on the subject, there are still plenty of people who hog all the discounts they can whether they are entitled to them or not. Of course the lumberman who refuses to maintain his terms and allows the buyer to say what the discount shall be has no reason to complain if it is excessive; but the objection may logically be made against taking a discount that one is not entitled to. A case of "rubbing it in" occurred recently when a lumberman sold a couple of cars of oak to a big consumer, who, after agreeing to take it at a price that was about as low as could be asked, said that his terms were two per cent thirty days, instead of the usual ten. The lumberman hesitated, but finally agreed to allow the extra time. He was considerably irritated, however, when the customer waited nearly two months and then took off the discount. The moral, apparently, is that if you make one concession, another is always demanded, so that it is just as well to stick to the letter of the law in the first place.

Foreign Exchange and Credit

A recent issue of *American Industries* contained an article on foreign exchange and credit by V. Gonzales which explains many points which concern me engaged in foreign trade. Referring to the period before the beginning of the European war it is stated that most countries were on a gold basis, that is, their different forms of money were convertible into gold on demand. Their international commercial transactions were adjusted according to the gold equivalents of their respective moneys, all referring to each other on a basis of actual gold being obtainable as final settlement.

The American dollar had an exact equivalent in all countries in proportion to the gold contained in every other unit and to the gold value of silver in silver standard countries. Commercial rates of exchange fluctuated according to supply and demand of transfers, but rates were confined within the limits of the cost of exporting or importing actual gold. These limits only in very exceptional cases were passed. The pound sterling was worth, at par, \$4.86 $\frac{1}{2}$, because it contained 4.86656 times the amount of gold contained in the dollar. Commercial rates fluctuated between \$4.82 and \$4.9065, because the cost of importing or exporting gold never was more than 4.656 cents per pound. And such was the case with all other moneys.

Now the relation has been broken because gold is not freely obtainable anywhere, except in small quantities. There is no fixed value to the dollar in the terms of any foreign money nor to any foreign money in the terms of the dollar. Market quotations have no longer any fixed limits and it is a matter of daily adjustment, according to supply and demand, and the chances each one may be willing to take. Transfers of money are not available anywhere and most of the transactions are limited today to cable orders or payments converted into local currency everywhere at rates fixed by the will of dealers in this line of business.

Whether or not gold will be restored as a basis of money values and what relation it will have to the former units, no one can tell. It is to be hoped that after the transition period all will return to normal conditions.

In the meantime, we have a very serious problem before us—the adjustment of accounts contracted in foreign money. Will goods sold in francs be settled in dollars? Drafts discounted by banks, coming back for want of payment will have to be taken up by drawers or endorsers. Who will be the loser in the reconversion into dollars?

While the difference in rates was small no disputes arose, and holders were contented many times with receiving another draft in foreign money, which was practically replacing credit in a foreign country. But at this time when differences may be very large, and other drafts may not be obtainable, the question will supply grounds for many disputes.

Legal proceedings will do good to no one; it will be much better to arrive at an agreement before the case presents itself.

Limits of exchange rates in all places are no more confined to cost of transferring actual gold which is practically impossible, and just as the franc can drop here from a par value of 19.295 cents to 16 cents or less, the dollar in France, worth formerly at par 5.18262 francs, may rise to 6, 7, 8 francs or more. Nothing can govern the rate.

Bills drawn in all countries on other countries in foreign money are payable in local currency at the collecting bank's rate for drafts in that foreign money.

The countries at war and others not involved in it have decreed moratoriums, that is, they have postponed maturities for a fixed period now, but which can be extended indefinitely. We are not at war and our payments are not postponed: what legal excuse can be given for a delay? On the other hand, if our collections are delayed everywhere, as may be the case, should we, alone, be forced to pay in due time?

Matters of national honor and individual credit do not seem to be so much at stake now. Every country is hurt, even if as far away as we are from the entanglements of the conflict, and every country is resorting to or considering moratoriums as a temporary relief until conditions become less stringent. Should we alone meet foreign obligations at their natural maturity? Payments due here by French mer-

chants enjoy the benefit of the moratorium decreed in France. Would American obligations payable in France enjoy the same privilege? Or does the moratorium in France apply only to foreign obligations payable in France by French people only?

We have advocated an extension of time to all foreign debtors, as a means of relieving the situation and making trade slightly less difficult. But the string should not be pulled one way only.

Exchange adjustments, at present, are next to impracticable and only an extension, practically a moratorium, can save the good name of acceptors. In London a moratorium was decreed not because of exchange difficulties, but because of lack of money or credit to settle obligations, and while bankers there all enjoy the relief of the extension they have not thought that they should grant as much as they took for themselves.

In few words, the absence of exchange, credit and money should simply put off for a period pending obligations of the whole world. We are much better off than the rest of the world, but if we become disabled, because of a quixotic pride in sacrificing our gold, who can then aid the trade of all countries during the crash and during the period of convalescence?

Domestic credit for domestic purposes is quite available here, but to maintain it and utilize it as much for ourselves as for the rest of the universe we must protect it. Our obligations, national, state, city, of corporations or of individuals, are not taken by anybody anywhere today, nor do we accept those of any other country.

The Rubber Industry of the Future

One quite frequently reads intimations in periodicals that the price of rubber is likely to take a considerable drop on account of the synthetic processes of making rubber, which are said to have recently proved successful. It is also believed by some that old rubber will eventually be so treated that it can be made to regain its original elasticity. While old rubber can be economically employed in a great many ways, it can never be made to regain its original characteristic elasticity. The disintegrating processes in old or dead rubber have progressed so far that it will be just as easy for one to change bad eggs into fresh eggs as it is to regenerate dead rubber into good rubber. In the utilization of dead rubber it is always necessary to add fresh or elastic rubber.

So far as the synthetic processes of making rubber are concerned no fear need to be entertained by those interested in the production of vegetable rubber. It has been claimed that very promising results have been attained through the chemical processes, but even if this is so, the process has yet to be made practicable. It does not seem possible, however, that rubber can be produced artificially from entirely different substances. The characteristic constitution of rubber is not very easily understood, and it is still more difficult to imitate and manufacture it on a commercial scale. There would be no necessity to produce rubber synthetically if a substance with similar elasticity could be discovered. Unfortunately, there is no such material.

That rubber will eventually decline in price on account of the numerous plantations which are now being started all over the tropics is also questionable. The increase in the production of rubber is evident, but as this increase takes place which will tend to decrease the price there is a corresponding increase in the demand for rubber. The automobile business increases enormously every year. The chief item of expense in the use of an automobile is the replacing of rubber tires, and the future income of the man who owns a rubber plantation is dependent upon the increased use of the automobile. The price of leather has an influence upon that of rubber. The pessimist who fears the fall in price of rubber has no foundation for his belief. Moreover, those who have given the matter considerable thought can readily see that the future outlook for rubber is very bright and that new fields will eventually be opened up from which vegetable rubber will be drawn.

Pertinent Legal Findings

Variance in Quality of Lumber

If a seller of a quantity of lumber delivered material of different quality, the buyer, by accepting the delivery, waived any right to afterwards complain of the quality, except to claim a reduction in the price to be paid. (*Norwood vs. Maremont, Wolfson & Cohen Company*, 182 Illinois Appellate Court Reports 78.)

Equitable Liens on Logs

Plaintiff contracted to buy a quantity of logs from defendant, who agreed to deliver them at a railroad station. After having the logs measured and branded with her brand, plaintiff advanced \$2,000 to defendant on the purchase prices. Held, that plaintiff acquired an equitable lien upon the logs which she could enforce, to secure repayment of such advances, against a third person, who afterwards bought the same logs from defendant. (*Kentucky Court of Appeals, Kline vs. Cofield*, 169 Southwestern Reporter 477).

According to the latest available figures, Pennsylvania stands fifth in the production of wood pulp and is second to West Virginia in the amount of slabs and other sawmill waste used for pulp; Maine stands third.

Duty to Safeguard Machinery

The decision of the Minnesota supreme court in the case of *Glockner vs. the Hardwood Manufacturing Company*, 122 Northwestern Reporter 30, sums up some of the vital rules of law which govern the liability of woodworking manufacturers for injury to employes caused by failure to equip dangerous machinery with safeguards. These rules may be summarized as follows:

When a state law requires dangerous machinery to be guarded, omission to equip a machine with a guard which it was practicable to apply constitutes actionable negligence, rendering the employer liable for any injury resulting to a workman as a direct result of such omission, without further proof of any carelessness attributable to the employer. But an employe, on suing for an injury received, has the burden of proving not only that the machine at which the accident occurred was a dangerous one, but that it was practicable to have equipped it with a safeguard. "The practicability of guarding dangerous machinery depends upon the character of the machine, its history, the difficulty of attaching a guard without interfering with its efficiency, and upon all the facts and circumstances surrounding the matter at and prior to the time of the accident."

Delivery of Lumber Sold

When an agreement for a sale of lumber has been entered into, and transportation of it by rail or vessel is involved, the question as to when title passes to the buyer may become a very important one. The point is usually raised when the shipment has been lost or damaged in transit, but occasionally arises where a third party attempts to attach the property as belonging to one of the parties.

Clear provisions of the contract of sale are, of course, controlling on this question, and the following observations are limited to cases where the contract is silent as to whether delivery shall be made to the buyer at the point of shipment or at the destination.

As a general rule, title is presumed to have been intended to pass to the buyer on delivery of the shipment to a railway company or other carrier for transportation to him. This is specially true when the buyer has designated a certain carrier to whom the shipment is to be delivered. But to constitute a delivery to the buyer through a delivery to a carrier, the seller must relinquish all control over the lumber. The seller cannot ship the freight to his own order, and then assert that delivery to the railway company was a delivery to the buyer's agent.

Prepayment of the freight charges raises an inference that the seller intended to retain title pending transit, but that presumption may be overcome by countervailing circumstances.

There is an authoritative appellate court decision to uphold the statement that when lumber is shipped in the name of the buyer, title passes to him under the general rule above stated, although the bill of lading be not sent to him at once.

Under a contract to deliver lumber f. o. b. cars place of loading,

it was decided by the supreme court of Wisconsin that the buyer was bound to pay for the quantity loaded on the cars pursuant to the agreement of sale, as distinguished from the quantity which arrived at the destination, since title passed to the buyer on the shipment being delivered to the railway company, subject to the buyer's right of inspection.

Employer's Liability for Accident

A woodsman engaged in trimming fallen trees is not entitled to recover for injury caused by his being struck by a branch in turning a tree over, although the tree may not have been felled in a proper manner, that not having been the direct cause of the injury. (*Kentucky Court of Appeals, Dotson vs. Delorme Lumber Company*, 169 Southwestern Reporter 503.)

Implied Contracts to Pay

When it is shown that a firm has received lumber and used it in the firm business, the seller need not prove an order therefor in order to recover the value thereof; acceptance and use of property implies a promise to pay. (*Georgia Court of Appeals, Cary vs. Simpson & Harper*, 82 Southeastern Reporter 918.)

Phases of Timber Conveyances

In the case of *Baker vs. Kenney*, 124 Northwestern Reporter 901, the Iowa supreme court decided the following propositions of law applicable to sales of standing timber:

A sale of trees growing upon a certain tract of land, with permission to cut and remove them within a certain time, gives no interest in the land itself, and hence need not be evidenced by a written instrument. (Ed. Note.—It would seem, however, that although a contract to sell standing timber does not pass such "interest in land" as is required by the statutes of nearly every state to be reduced to writing, the agreement does fall within the laws of the several states which require contracts not to be performed within the period of one year to be evidenced by a writing signed by the person to be bound thereby.)

A conveyance of all the "timber and growth of timber," on a given tract of land, with the privilege of removing the same, includes timber growing after the date of the deed, as well as that standing at the time.

Ordinarily a contract to sell growing trees to be removed within a specified time, gives title only to such trees as are cut and removed within that time, or, if no time is specified, title to such as are removed within a reasonable time. But the courts will declare that a timber deed gives a perpetual right to remove trees, where the language of the deed clearly manifests such intention, as where an owner of land conveyed to the grantee, his executors and assigns, all the timber and growth of timber on certain lands, with the privilege "at all times" to enter upon the land for the purpose of cutting and removing the same.

Risk Not Assumed by Employe

An employe of a lumber company does not assume the risk of being injured or killed through fall of a pile of lumber placed upon a floor which is insufficiently underpinned, unless he knows of the defective condition. (*South Carolina Supreme Court, Anderson vs. Conway Lumber Company*, 82 Southeastern Reporter 984.)

Letter Was Not Libelous

Where plaintiff placed a claim for collection with attorneys against defendant on the ground of shortage in a shipment, defendant's letter written the attorneys in response to a demand for payment, denying that there was any shortage, and stating that it was "just a case where we think Mr. Brown wanted to get an allowance of \$10," was not libelous. (*North Carolina Supreme Court, Brown vs. Elm City Lumber Company*, 82 Southeastern Reporter 961.)

Lumber Hauler's Right to Lien

One who contracts to furnish teams for hauling lumber, either driving the teams personally or employing drivers at so much the thousand feet, is not entitled to a statutory lien to secure payment of his compensation, as an "employe" or "day laborer" of a corporation or partnership.

Promoting Hardwood Trim

Do you fully realize the importance of house trim as an item in the hardwood trade? Unless you have studied this subject in a broader light and beyond the actual volume of immediate consumption of hardwood in this work, the chances are that you do not realize its full importance. It is not merely that hardwood trim has been an item of some comparative importance during the past building season; it is not either merely that it has been a sort of saving grace in the trade in many instances and has furnished one of the few bright spots in the trade during the fall and summer; but beyond this there is interest and importance in the fact that hardwood trim has an effect upon the furniture trade. The hardwood trim used determines to quite an extent the kind of furniture that will go into the homes.

Take an office building, for example, and let the hardwood trim be of mahogany throughout, and the tendency toward mahogany furniture among the occupants of a new building of this kind will be very strong. Those who buy new furniture will buy mahogany outright. Some unable to afford the mahogany may buy birch stained; others with oak furniture may abuse the good oak by staining it red to harmonize with the mahogany trim.

The same story holds true in house trim. If a man in building a new home uses oak for the interior trim his preference will naturally turn to oak for the furniture in everything from parlor to bed room. If a part of the house is trimmed in oak and part in mahogany that part which is trimmed in mahogany will likely be furnished in the same wood or in birch. So if the parlor is finished in mahogany it quite frequently means mahogany parlor furniture and piano; if the dining room is finished in mahogany it may lead to mahogany dining room equipment, whereas, if it is finished in oak the entire dining room outfit is likely to be oak. If the bedroom is finished in maple with maple flooring, one is likely to see maple chairs and dresser and metal bed, whereas, if it is finished in gum, the people are likely to turn to gum or Circassian walnut for this, and if oak, oak will likely be the keynote to the furniture.

When hardwood trim is looked at in this light—in the light of its effect upon the furniture—and the fact is considered that it is often the thing which decides the selection of furniture, one begins to realize something of the importance of house trim to the hardwood trade. The use of one kind of trim is a sort of opening wedge to a call for more of that particular kind of lumber, whether it be in an office or in a home.

The subject under consideration now, however, is hardwood trim. Flooring, though it might properly be considered a part of the hardwood trim of a home or an office building, is usually classed separately, and under the classification of hardwood trim there is included the interior casing and base, stairways, picture moulding, and paneling where panels are used. There has been a material increase in the use of practically all of our native hardwoods in interior trim during the past few years. It has grown into a factor of some importance itself and when the effect it has on the selection of furniture wood is considered, the importance of hardwood trim as a factor is multiplied. In this development of the trade in hardwood trim these interested in promoting various kinds of wood give the matter some attention but too often the manufacturers and dealers in hardwoods themselves have rather neglected this phase of the matter because it doesn't call for a big enough volume of lumber in any one locality. It is a trade that is scattered and while it amounts to considerable in the aggregate it is made up of comparatively small units. For this reason it has been somewhat neglected.

There is another reason, too, that interferes or rather at times acts as a handicap to the progress of hardwood trim, and that is its cost as compared to yellow pine. When people figure on gum, for example, as compared to yellow pine they find that the millwork for a house runs up into big figures notwithstanding the fact that originally the rough lumber may not have cost a great deal more. The same thing is true when oak is compared with pine, and often the man who is going to build and is inclined to use hardwood trim balks at the extra cost and wonders what causes it.

One important cause is to be found in the difference in practice in the matter of planing millwork and preparing trim. The big yellow pine mills as a rule operate planing mills and have established standard patterns to which much of the pine finish for trim is worked in great quantities at the mill before it is shipped out. This makes it practical to furnish yellow pine trim dressed to pattern at practically the same price as the rough lumber where the freight rate is an important item because the saving in freight on the dressed stock pays for the work of dressing. When one figures stock of this kind against oak, gum or other hardwoods which must be bought in the rough, then milled to pattern in small quantities for each individual order there is a sharp addition to the cost, entirely aside from the difference in value or the cost of the lumber originally. This has at times proven a somewhat serious handicap to the progress of hardwood trim.

Some of the birch people have set a splendid example in this line. They have developed the practice of working birch to pattern in quantities and of supplying it to the trade ready to put up just as yellow pine is supplied in standard pattern. Some of the sash and door jobbing houses handle birch trim right along with sash, doors and moulding because it is dressed to pattern and at times cut to length so that it is ready to use. This example is one that might well be followed by those interested in pushing gum, oak and other hardwoods, who have not yet taken up with this idea as they should. The tendency of the hardwood sawmill man has been to fight shy of the planing mill idea because it adds to the expense of his equipment. Many of them may be right in this attitude. Assuming that they are, then the idea of pushing hardwood trim would suggest a necessity for some central planing mill plant or a centralizing of their stock for this purpose at some shipping point where it can be dressed to standard pattern in quantities and be supplied to retail lumber yards and others ready to go in place at a price that will not make such a striking difference between it and the soft woods. There will, of course, always be a call for certain patterns and a great amount of millwork to be done to special orders, to architects' or builders' specifications. There is considerable of this even in the softer woods with all their standard patterns. Even so, however, there is evidently room to develop a much larger trade in hardwood trim by following out in some rational manner the idea of supplying it dressed to standard patterns pretty much as pine and birch are supplied today. This will not only make it available at lower cost for the standard but it will encourage the use of the hardwood in standard pattern and this in turn will help promote hardwood in special patterns and thus enlarge the entire volume of trade in the millwork line. Another thing worthy of consideration in this connection is, the more hardwood trim the people use the more they will turn to hardwood floors, and finally it is an important factor in deciding the choice of furniture wood. So the promoting of hardwood trim is easily an idea worth while. It doesn't merely need serious consideration, it needs active exploitation. It doesn't need merely talking about and the showing of hardwood trim and paneling at expositions, but it needs some practical work along the line of making hardwood trim available to the average home builder at a price that is not out of reason. The birch people have set a good example along the right line that other hardwood people might well follow and even go it one better if they can see the way clear. There is perhaps no other field for lumber trade development that will yield bigger returns to the hardwood fraternity than persistent effort directed in the exploiting of hardwood trim.

Coming Across

The South Indian Railway has asked for bids from manufacturers in the United States on supplying a number of freight locomotives. The order for these was placed in Germany last summer, but troubles in that country prevented the filling of the contract, which has now been cancelled. Thus one by one the people in all parts of the world are turning to America to have their wants supplied, and it is fortunate for all concerned that America is in a position to take upon itself this extra work.

Musical Instrument Exports

The export of pianos, organs, and other musical instruments to foreign countries for the United States makes a creditable showing. Instruments go to every important country in the world. Persons who suppose the American instruments have no foothold in European countries should revise their conclusions. Last year manufacturers in the United States shipped 7,608 pianos to various parts of the world and Europe took 1,631 of them. Italy was the largest purchaser, inland second, Germany third and France fourth on the continent; but England bought more than all the rest of Europe combined. The sales of piano players were likewise large in Europe.

Canada is the largest purchaser of musical instruments made in the United States, and Mexico is next after England, but Cuba comes pretty close to Mexico. Brazil is the largest buyer in South America, followed by Argentina, with Uruguay third. Panama purchased more of our pianos than all the rest of Central America together. Egypt bought more than all the rest of Africa. Australia and Tasmania are large purchasers of American pianos, but they buy far more extensively from Germany. All Asia buys only seventy-four pianos from the United States, and Africa but thirty.

Our export of organs in 1913 amounted to 5,729 instruments, and nearly half of them went to England. Next to England, Germany was the largest purchaser, and the Netherlands third. Scotland was a large buyer. The whole continent of South America, with Mexico and Central America added, did not buy as many American organs as the little state of Panama. This gives a hint of what would probably happen if a little more Anglo-Saxon enterprise could gain a foothold in Spanish-America.

The total value of all musical instruments and supplies exported from the United States in 1913 was \$5,851,610. That represents an increase of exactly 200 per cent over the exports in 1909, a period of four years.

FIGURES ON MANUFACTURE

The latest complete figures on the manufacture of musical instruments are for the year 1909. It is known that an increase has taken place since but it can not be stated how great the increase is.

In that year there were 294 piano factories in the United States, 86 organ factories, and 127 factories which made parts of instruments only.

The piano factories employed 28,415 persons; 2,754 made organs, and 10,713 were engaged in manufacturing parts.

These establishments use 41,623 horsepower.

The piano factories are capitalized at \$81,544,094, the organ factories at \$4,553,609, and the factories which make parts at \$17,136,598.

Expenses, including salaries, wages, and services, amount to \$59,833,694 a year for the pianos, \$4,097,384 for the organs, and \$16,819,447 for the parts.

The piano makers pay \$32,818,770 for materials, organ makers pay \$1,722,923, and the part makers pay \$9,223,044. Other expenses add about one-fourth as much more.

The output of the piano factories is valued at \$66,569,273, organs \$4,745,655, and of parts \$18,474,616. The total is \$89,789,544.

The value added by manufacturing—that is, over and above the raw material—is \$33,750,503 for pianos, \$3,022,732 for organs, and for parts \$9,257,572.

RANK BY STATES

New York leads all other states in the manufacture of pianos and organs, judged by the value of output, the persons employed, and establishments. Rated by the number of establishments only, the following table shows the rank of the leading states:

State	Establishments
New York	184
Illinois	68
Massachusetts	59
Ohio	30
Pennsylvania	30
New Jersey	18
Connecticut	17
Michigan	17

Indiana	15
Wisconsin	11
California	11
Maryland	7
Kentucky	6
Minnesota	5
Iowa	4
Vermont	4
Maine	3
All others	18

Total 509

In 1909 there were 365,413 pianos manufactured in the United States, and of these 330,918 were uprights. Of the 509 establishments manufacturing instruments, ten exceeded a business of \$1,000,000 each.

OTHER MUSICAL INSTRUMENTS

There are many musical instruments other than organs and pianos, but it is not practicable to enter much into details of their manufacture and export, because of the manner in which statistics are kept. Most of the figures concerning manufacture are four years old, having been compiled in 1909; but the export statistics are for 1913.

Last year 1,258 piano players, valued at \$287,720, were exported from the United States, and 1,374 player pianos, worth \$388,293.

The exports of phonographs and supplies were worth \$2,805,978, and all other musical instrument exports were valued at \$754,099.

There are in this country 187 establishments which make musical instruments other than pianos and organs, and New Jersey leads all of the other states in capital invested and value of products. For the whole country the persons engaged in the industry number 2,268; capital, \$3,297,669; expenses per year, \$2,647,477; value of products, \$3,228,108.

DEMAND FOR WOOD

The manufacturers of musical instruments in the United States report the use of forty-one woods to the amount of 260,000,000 feet a year. Only ten industries of the country use more. Maple leads all others in amount and its annual total is 45,482,775 feet. Yellow poplar is second in quantity with 5,000,000 feet a year less. Chestnut stands third with 38,000,000 feet, with spruce fourth at 29,000,000 feet. Much of the spruce is made into sounding boards. Following are the musical instrument woods of the United States, arranged in the order of importance, from those demanded in largest amount to the least:

Maple, yellow poplar, chestnut, spruce, oak, elm, birch, basswood, white pine, red gum, mahogany, black walnut, beech, ash, cottonwood, yellow pine, sugar pine, hemlock, Douglas fir, tupelo, cherry, sycamore, redwood, Circassian walnut, balsam fir, butternut, West Indies boxwood, cypress, ebony, rosewood, cedar, Spanish cedar, buckeye, satinwood, prima vera, holly, eucalyptus, camphorwood, tulip wood, hickory, Turkish boxwood. The woods in the above list which follow sugar pine are used in amounts less than one million feet each a year.

Cherry is the wood most used as a backing for the metal plates from which illustrations are printed in magazines and periodicals. It is chosen above all others because it holds its shape, does not warp or twist, works smoothly and does not split.

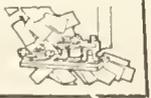

Two governors, those of Oregon and Massachusetts, have suspended the hunting season this year because of increased danger of forest fires when the woods were exceptionally dry.

The position of city forester is now offering a new field for men with a technical training in forestry. Fitchburg, Mass., is one of the latest towns to secure an official of this sort.

Because of extreme drouth, the fire risks on the national forests in the Northwest have been greater this season than in any other since 1910, the worst year since the forests were created. Much less damage was done this year because experience in fire fighting was gained in the fires of 1910.

Interesting Northern Meeting

The quarterly meeting of the Northern Hemlock & Hardwood Manufacturers' Association was held as usual at the Hotel Pfister, Milwaukee, Wednesday, October 28. An unusually exhaustive and interesting program had been arranged, which comprised a discussion of a variety of topics that proved mighty interesting.

The principal discussion had to do with the subject of feeding of men and of manufacturing costs.

President R. B. Goodman opened the session without the regular address. He took occasion to read a number of replies he had received to a letter he had sent out suggesting a general campaign to induce the yardman to make his retail prices conform to the lower level of wholesale prices which now in general prevails.

Following the reading of the minutes and roll call, the secretary presented the report of the treasurer, which showed a balance on hand July 17 of \$2,415.44; receipts from the secretary, \$6,655.36, making the total resources, \$9,070.80. Of this there was paid out \$5,205.70, leaving a balance of \$3,865.01.

Secretary Kellogg in his report urged greater co-operation of the members in the matter of reports which he requests regularly on various subjects. He deplored the tendency to loose methods in the administration of the lumber business, maintaining that the time has gone by when these will result in success.

Referring to the reports of stock on hand and cut and shipments, the secretary said that they indicate decreasing volume of sales since the beginning of the war and relatively increased amount of stock on hand. According to his estimate there will be less lumber cut this year than last, the figures on hemlock being 16 per cent; hardwoods 26 per cent, and pine, 33 per cent.

Referring to the results from advertising Mr. Kellogg said that never before has the advertising been bringing so many inquiries for information on building materials as during the last two months, which would indicate that the architect, contractor and the home builder are all anxious to have as much authoritative information as possible as to the best woods for different purposes.

He advocated that efforts should be concentrated, during the coming months of slack trade, upon investigations of new channels for the sale of lumber, and investigations as to the best means of meeting the peculiar requirements of different consumers.

M. P. McCullough, chairman of the advertising committee, had some interesting suggestions to make in his advertising report, which follows in full:

Report of Advertising Committee

We completed the second year of our advertising early this month and are more than ever convinced that the results we actually see fully warrant the appropriation that has been made for this work. Our replies have been much greater in the past year than during the first twelve months of the campaign, due probably to our greater experience and the fact that the entire work has been handled direct from the secretary's office without the aid of an agency, which our limited appropriation would not permit. We not only have to exploit the intrinsic value of our commodity, but there is nothing sold today to the general public that is harassed so vigorously on all sides by substitutes as is lumber, and the tactics of the manufacturers of these substitute are manifestly unfair.

We have before given you statistics showing the approximate advertising appropriations made by other lumber associations which have in every case greatly exceeded the amount available for this committee. We have not been seriously handicapped, simply our field has been limited, and now we feel that we are using the mediums that render the greatest returns.

In a late article in *Advertising and Selling* figures were given to show that the largest advertisers of our country appropriate from two per cent to ten per cent of their gross sales for advertising and a large number greatly exceed these figures. Our appropriation for this work is one cent per thousand or about one-fifteenth of one per cent of the selling value.

Only recently in brick advertising, lumber was directly accused of the Chicago fire of 1871, that of Chelsea, Mass., Houston, Texas, and the more recent Salem conflagration, and this impression has been so forcibly "driven home" to the general public by the manufacturers of substitutes that, as a starter, attempts are being made all over the country to eliminate the use of the wooden shingle by ordinance which, nevertheless, permits the continued use of many so-called substitutes that in-themselves

are highly inflammable. We cannot afford to "sleep on the job," especially as we are now so well started.

Our exhibit at the Wisconsin state fair this fall was, we believe, very effective, yet inexpensive. Samples of all the Wisconsin and Michigan woods were displayed both in the rough and in finished panels attracting considerable attention. This exhibit was later shipped to the county fairs at Sawyer, Viola and Gays Mills, Wis., and taken charge of by the local lumber dealers at these points. There is very little expense incurred in making these exhibits and we believe it should be done on a larger scale another year.

Our new birch book, copies of which have been sent to each member, is being placed in the hands of architects, builders, retail dealers and others where we think they will bring results. Three thousand copies have been printed, out of which four hundred were taken direct by members at cost. This is the cheapest birch book we have gotten out, due largely to Keith's Magazine and the American Carpenter and Builder who loaned us a large number of cuts. The demand will greatly exceed the supply.

Our hemlock advertising in farm journals will commence November 1 and runs to April 1 of next year. In addition to this we have taken the suggestions made by a number of our members at our last meeting and arranged to use weekly newspapers or the Sunday edition of daily newspapers for the next four months along the borderline at Jausville, Rockford, Dubuque, Waterloo and Winona. This added cost can very easily be taken care of within our appropriation.

We find that hemlock lath are being discriminated against in the Chicago market and unjustly so. We are therefore taking steps to inform the architects, builders and lath supply men regarding the excellent points in favor of hemlock lath and will endeavor to have them fairly judged. We know that they are in a great many ways far ahead of other woods and will try to successfully demonstrate it.

In conclusion we wish to call your attention to the increase in value of the better grades of birch, especially during the past ten years. Log run birch has steadily increased in value, except for a slight recession in 1908 and 1909, and at the present time we are realizing from \$8.00 to \$9.00 per M feet more for log run than we were able to obtain in 1904. In 1908 No. 1 common birch 4/4 was bringing from \$16.00 to \$17.00 per M and first and second clear from \$27.00 to \$28.00 per M at shipping point. The values of these grades have continued to advance since that year and for the past two years have readily brought us from \$20.00 to \$23.00 for the No. 1 common and the first and second clear birch 4/4 has increased in value from \$11.00 to \$14.00 per M and has been selling at from \$38.00 to \$43.00 f. o. b. shipping point. We do not claim that your advertising committee is to be held responsible for this, but we do believe that this increase is due principally to the merits of the wood becoming more generally known, and, as the high point of the production of birch has been reached, that we must continue to exploit its merits, for we have a wood that will back us up in everything we have claimed.

It is our idea that our advertising is in reality a most excellent insurance policy.

In addition to his report, Mr. McCullough made the suggestion that his committee can have printed a variety of mail stuffers, tending to create a better mental attitude among the customers of the association members.

George H. Chapman of the railroad committee reported that the Wisconsin Railroad Commission recently sent out a notice of a hearing on fuel wood rates, which has since taken place November 4. He referred to the re-opening of the 5 per cent general increase case stating that in his opinion this is a matter for the National Lumber Manufacturers' Association. He spoke of the proposed advance on lumber from Wisconsin to the eastern states, maintaining that this should not become effective as other building materials have not experienced a similar advance.

J. E. Rhodes, secretary of the National Lumber Manufacturers' Association, responded to a request for an address and expressed his usual instructive thoughts. He reviewed the Forest Products Exposition results, saying that there is now \$10,000 in the treasury, which was realized. He suggested the advantage of starting individual expositions in different cities and mentioned a number of cities where active steps for such work have actually been carried on.

Mr. Rhodes said that the credit corporation, which is maintained as an adjunct to the National Lumber Manufacturers' Association, is now completely out of debt and has been incorporated for \$50,000.

Referring to the rate situation, he said that speaking frankly the lumber business "got it in the neck," on the 5 per cent decision, and this was due to differences of opinion among the lumbermen as to the justification of advances, and to the fact that too much

was said regarding the general justification for advance, and too little as to the injustice of advancing lumber rates, which even then were too high.

The testimony of the lumber committee aiming at the maintenance of old rates on lumber was nullified by the testimony of other lumbermen who seemed to feel that the general advance was justified without considering lumber as an individual product.

According to Mr. Rhodes, cement manufacturers were represented by one man who spoke only on that topic, and as a consequence the cement manufacturers won their plea for the maintenance of the old rates. This was also true with the brick manufacturers.

He referred to activity in the compilation of evidence affecting the box controversy, and then referred to the recently inaugurated study of the lumber industry as it is being carried on by the Forest Service in conjunction with the Department of Commerce. He said that this as distinguished from other investigations in lumber will tend to help the lumbermen. In fact, it is aimed at the gathering of true and fair information so that the public in general can be informed as to actual conditions.

According to Mr. Rhodes one of the greatest difficulties in the gathering of accurate information is the absence of standard cost systems. He said that investigators will make recommendations along this line.

Mr. Rhodes assured his listeners that Forester Graves desires to review the findings of the lumber investigations before making them public. Mr. Rhodes referred to a conference with Mr. Graves and Mr. Greeley, his assistant, and said that the lumber trade will have a proper committee ready to confer with the officers when the report is completed.

He referred to recent so-called fire tests of frame and brick buildings carried on in Chicago, and spoke more fully of the anti-wood campaign, saying that the National association because of lack of funds has been able to do little against it. He said that the work has not been for the purpose of demanding the use of wooden shingles regardless of fire risks, but has rather been to make them fire retardant, and to get the co-operation of the authorities with a view of at least fair-dealing in the setting of fire limits.

He then referred to a recent meeting of the board of governors of his association.

President Goodman introduced H. F. Weiss, director of the Forest Products Laboratory, Madison, Wis., who delivered an interesting and instructive address.

Mr. Weiss referred to an original dry-kiln system which has been developed at the laboratory, whereby in experiments they are able to get very accurate results through the absolute control of the humidity and temperature. As an example, Mr. Weiss presented experiments of western larch which were dried under ordinary circumstances and those which were dried at the experimental kiln. The results were conclusive, as instead of the honey-combing and checking which usually result from ordinary methods of procedure, the specimens turned out in perfect condition.

He offered this as an evidence that through the experimental work a certain species of timber could be opened for exploitation which would ordinarily not be considered.

The collapse of western red cedar during the drying process presented another problem. This according to Mr. Weiss usually results from the application of too great heat during the early stages of the drying. As a result conflicting stresses are started which disrupt the wood fiber. He recommends a pressure of about 140 degrees Fahrenheit at the beginning with relative humidity until such time as the fiber has been completely saturated, from which period it can be raised to 160 degrees, after which conditions the specimens have shown it will be dried perfectly.

The main point of the talk was devoted to a discussion of a campaign for the elimination of shingles in large cities and experiments for plans looking toward the perfecting of a commercially feasible treatment of fire-proofing wooden shingles.

The laboratory is carrying on extensive experiments along this line, and samples Mr. Weiss showed demonstrated that they have been more or less successful, although they have not worked out as yet to his complete satisfaction.

He touched on the new investigations of the lumber industry as carried on by the Department of Commerce in conjunction with the Department of Agriculture, stating that problems incident to the utilization of poorer grades of lumber have been put up to the Madison Laboratory for solution.

He concluded his address with the following:

The manufacture and merchandising of lumber are undergoing a radical change. Old methods have had their day and are being brushed aside, while lumber also is being shovled off the market. Much of this elimin-

ALWAYS - Beans, Bread, Butter, Crackers, Tea with and without sugar in pot.

ALWAYS - Beans, Bread, Butter, Crackers, Syrup, or Jelly, Cake, Gingerbread or Cookies, Tea with and without sugar in pot

tion is without doubt entirely justified because we are building more substantially than in the past and because other materials now compete with lumber which possess superior qualities. But why not improve methods? Why not improve practice? Lumbermen take a very apathetic attitude toward such questions—an attitude which is discouraging to all those interested in the proper use of timber. I feel it is squarely up to the lumbermen themselves to take a more active part in their own business. You are now in a defensive position and, in my opinion, this is always a weak position. Changes in the manufacture and merchandising of lumber are going to occur whether or not you wish them. The causes for these changes are so fundamental that they are already outside of your control. But it would seem the part of wisdom and sound business for all lumbermen to take a real, active interest in the effects of these causes rather than to hold aloof from them or to continually oppose them.

In conclusion, I should be glad to cooperate with this association in our study of the lumber industry which we now have under way, particularly in securing data on the amounts of low grade lumber and waste you produce, and in determining the most practical means of decreasing the amount of low grades and increasing the utilization of waste.

The subject of feeding men in logging camps was opened by the reading of a pamphlet on this subject prepared by R. S. Kellogg, secretary of the association. This pamphlet, which was full of instructive suggestions, can probably be obtained by writing Mr. Kellogg at Wausau, Wis.

The most notable feature was the preparation of a tentative standard bill of fare which Mr. Kellogg was earnest in maintaining as merely tentative and suggestive. It is reproduced on page 30.

The investigation which led up to Mr. Kellogg's final conclusions was exhaustive and extremely systematic and practical.

An interesting discussion followed the general report, E. A. Hamar saying that he has been investigating the problem very closely and has found that a very large part of the cost comes from an excessive feeding of meat; that this has amounted to eight cents per man per meal, and he is not now feeding his men so much meat as he formerly did; and that this item should be cut down.

R. B. Goodman opened a discussion of camp expenses. He said that this daily expense for productive days of labor, not including Sundays, averaged 68.8 cents.

Secretary Kellogg suggested requesting the University of Wisconsin to investigate the problem along scientific lines through its domestic science department. He suggested that cereals such as oatmeal with milk are not good food as other more attractive food is usually eaten first, with the result that the oatmeal is usually left.

C. H. Worcester stated that there is too much food on the table at once, and thought that food might better be served in courses.

M. J. Quinlan said that his company has two camps, one of eighty men, where the average cost per day is 73 cents, and one camp of 125 men, where the average cost is 77 cents. He said that at the 125-man camp, each man has consumed an average of three-and-a-third pounds of meat per day, and that this camp reduced the average cost 17 cents by changing cooks.

He also said that there is not so much "sickness" when there is a charge for board on idle days, and that the use of eggs does not necessarily cut down the feeding of meat.

It was moved that the matter be taken up with the University of Wisconsin.

President Goodman opened up a discussion on the cost of logging. He said that there is no real standard of cost accounting in this question, and it is difficult to give real accurate figures, that inconsistent figures on one item would probably be compensated by more consistent figures on others.

He said that there was a tendency to omit charging "carrying charges" against standing timber, and in this way it was very difficult to ascertain whether an actual loss or profit is sustained in lumber operations.

Mr. Goodman read a summary of percentages of different grades, which he has worked up from close observation. The summary was as follows:

	FAS	No. 1	No. 2	No. 3
Maple	12	25	23	40
Soft Elm	15	25	20	40
Birch	20	25	20	35
Hemlock		40	20	40

The following is a table reproduced by him which he explained, and which offers at least good, interesting suggestions:

LUMBER—Cost Sheet

	Ash	Hardwood	Birch	Maple	Soft Elm	Oak	Hemlock
LOGS

	Ash	Hardwood	Birch	Maple	Soft Elm	Oak	Hemlock
EXPLANATION—							
Stumpage							Overhead—Logging Supt.—Office Expense, Workmen's Compensation, Fire Insurance, Depreciation of horse and equipment, Foreman's scaler and clerk.
Stumpage Expense							Mill to Pile
Actual Logging							Mill Labor
Swamping							Supplies and Repairs—Mill and Yard
Skidding							Oil and Waste
Loading							Power
Supplies and Repairs							Superintendent
Roads and Spurs—Proportionate cost of Camp Buildings, Roads and Railroad Branches							Sorting and Piling
Log Haul or Logging Railroad							Plant Overhead—Depreciation to Mill—Insurance on mill and on lumber, taxes on same, liability insurance, office expense, extraordinary operating expenses.
Sleigh Haul							Shipping—Cost varies with manner of selling lumber, 25c more when shipping on grades.
Railroad Maintenance							Sales Expense (must include commissions)
Railroad Operation							General Expense
Freight—Railroad Freight when shipped on line of Common Carrier—This amount is an arbitrary. Mills located in their own timber have other expenses which offset this item							Discount and Deductions
							Interest—6% on estimate of \$150.00 of investment in Fixed and Working Capital for every M feet manufactured per annum.

It is estimated that a mill manufacturing 20,000,000 feet of lumber will necessitate a total investment of \$300,000.

M. P. McCullough stated that in his opinion nobody has an over-run of fifteen per cent on hardwoods, and that as a consequence the price statement which Mr. Goodman read in connection with the grade percentages showed even more unfavorably.

M. J. Quinlan, reporting for the bureau of grades and market conditions, referred to the Michigan report and said that it shows conditions substantially the same as in Wisconsin. He raised the question as to the suggestion that the association join the National Hardwood Lumber Association as a body rather than as individuals. He recommended that no action be taken until the annual meeting.

The president called on George W. Jones, secretary of the Illinois Lumber & Building Supply Association. Mr. Jones referred to the traffic work of that association and recommended that jobbers take advantage of it. He said that his organization is making no special effort to stimulate building on account of present low prices of lumber.

Adolph Pfund, secretary of the Wisconsin Retail Lumber Dealers' Association, gave an interesting resumé of retail conditions throughout Wisconsin. According to Mr. Pfund the retail business is now below normal. Retailers have made decided reductions to consumers in conformity with lessening prices they have paid. This is simply the logical result of competition. The speaker did not recommend active "hild now" campaigns.

M. J. Fox spoke earnestly regarding the tendency to manufacture more lumber than the demands would justify. He said that the average consumer does not want fluctuating prices any more than does the manufacturer.

C. H. Worcester spoke rather pessimistically regarding the situation and expressed himself as anticipating a lack of consumption in all lines for some time to come.

The motion was adopted that it was the consensus of the meeting that retailers are doing everything possible to assist the trade as a whole under the present difficult conditions.

On motion of M. P. McCullough, the secretary was instructed to put a notice in the next bulletin to the effect that any members wishing mail stuffers should address the secretary.

After a few remarks by representative members of the lumber trade press, the meeting adjourned.

Southern Loggers Meet

The annual meeting of the Southern Logging Superintendents' Association was held in New Orleans October 26, 27, and 28. The proceedings consisted of a few well prepared addresses on live topics, and full discussion of numerous questions of interest to loggers. The address by President J. B. Baker and the report by the secretary, James Boyd, disposed of the preliminary business, and opened the way for the general discussions.

W. W. Ashe, who is a forest inspector in the Forest Service, read a paper on "Small Timber and Logging Cost." Mr. Ashe's conclusion was that each operation, involving different costs of logging, different amounts of overhead charges, and varying percentages of small trees, must be handled as an individual case. The tension zone between loss and profit must be determined by the woods foreman, mill superintendent and office, and the forester can advantageously be consulted from the point of view of the future profits of the small material. They must jointly determine the profit or loss in operating trees of each diameter class according to the relative profit contributed by each class.

The subject of accidents came in for pretty full discussion, and there were two set addresses along that line, the first by C. P. Myer, of the Kirby Lumber Company, on the prevention of accidents, and the other by W. H. Aldrich. The point which was most strenuously insisted upon was that foresight in guarding against accidents was of more importance than anything else, and that the lumber company's or the insurance company's greatest savings were made by rendering accidents as nearly impossible as circumstances will allow. It was shown by statistics that instruction and warning to the men accomplish a great deal in lessening the number of accidents.

Dr. R. B. Austin, camp physician of the Fernwood Lumber Company, presented the topic of logging camp sanitation, and handled the subject in much the same way as the speakers on accidents handled theirs. Practically the whole battle against disease can be fought along the line of prevention. The three danger points were

declared to be house flies, mosquitoes, and surface water. Unless these can be eliminated, the logging camp will be in constant danger of invasion by disease. A list of well-worded mottoes on sanitation was recommended for tacking in conspicuous places about logging camps.

The ever-present problem of feeding the horses, mules, and oxen that do the heavy work of the logging camp was presented in an address by Dr. W. H. Dalrymple, of the Louisiana State University. A technical discussion of this subject necessarily involves a good deal of chemistry which is nearly a dead language to persons who have not had considerable training in the application and meaning of the terms in use. However, Dr. Dalrymple summed up his argument in plain language, one of his conclusions being that a system of feeding should be followed corresponding as nearly as possible to the natural methods of the animal, and that no food should be given that is not absolutely sound, wholesome, and nutritious.

A paper descriptive of logging methods in southern Brazil was read by G. W. Patterson, member of a lumber company in Brazil. The methods used in the forests of South America were shown to be up-to-date, but are in no way in advance of methods in the United States. The logs in that part of Brazil run about three to the thousand feet, and the stand averages about 7,000 feet per acre. It is chiefly pine.

The officers of the association for the ensuing year were chosen as follows:

- PRESIDENT—C. P. Myer, Kirby Lumber Company.
- FIRST VICE-PRESIDENT—Oscar Marsans, Opdenweyer Aicus Lumber Company.
- SECOND VICE-PRESIDENT—F. B. McCormick, Carrier Lumber & Manufacturing Company.
- SECRETARY—James Boyd.
- STATE VICE-PRESIDENTS—Levi Wilcoxon, Arkansas; C. M. Munson, Florida; J. B. Work, Georgia; R. Lee Bass, Louisiana; V. C. Langley, Mississippi; W. H. McGregor, Texas; C. C. Curry, Alabama; E. W. Tschudy, Tennessee.

Traffic Matters Around Memphis

There was a meeting of the board of managers of the Southern Hardwood Traffic Association at the offices of the latter on Thursday afternoon, November 5. This was the regular monthly meeting of this organization, but one of the principal features taken up was that regarding the increase in rates on shipments of oak, cottonwood and gum from Memphis and points in Mississippi and Louisiana to Ohio river crossings. So far as this particular feature is concerned, however, the meeting was executive and nothing given out for publication beyond the fact that further steps will be taken for combating the higher rates. In this connection, the association is in receipt of definite assurances from the Cincinnati Lumbermen's Club that it will join with the Southern Hardwood Traffic Association in fighting the advances in question. It is also suggested that the lumbermen of Cairo will co-operate with the local organization, which represents most of the hardwood lumber manufacturers in Mississippi valley. Further information from Cairo is expected within the next few days.

In the meantime, the Southern Hardwood Traffic Association is in receipt of advices from the Interstate Commerce Commission indicating that all the increased tariffs recently filed by southern roads have been suspended until January 28, 1915, as was done in connection with the first general advance announced by the Illinois Central and other roads. This means that none of these advances will be allowed to be one effective until hardwood lumber interests have been given an opportunity of presenting their side of the controversy.

A rather peculiar move has been made by the trancontinental roads in announcing an advance of 5 cents per hundred pounds on shipments of hardwood lumber from Memphis to Pacific coast points,

effective November 15. The steamship lines operating from Mobile, New Orleans, and other southern ports have made a rate of 40 cents to Pacific points, via the Panama canal, while the rail rate from Memphis to these ports is 12 cents, making a total of 52 cents. The all-rail rate is already 75 cents and it was thought that this would have to be lowered in order to compete with water transportation. The railroads, however, have taken an entirely different view of the matter and are seeking a still further increase in rates to 80 cents. It is certain that the Southern Hardwood Traffic Association will resist these proposed increases in rates and to this end a petition has already been filed with the Interstate Commerce Commission.

Trancontinental roads, several years ago, attempted to advance rates to the Pacific coast to 85 cents. In fact, the high tariffs were put into effect and hardwood lumber interests here were successful in getting the old rate of 75 cents restored. Geo. D. Burgess was at the head of the Memphis Hardwood Rate Association, which won this victory, and he is at present the presiding officer of the Southern Hardwood Traffic Association, which will lock horns with the Transcontinental Freight Bureau in this latest contest.

Just at a time when the trancontinental roads are seeking to advance rates 5 cents per hundred pounds, the Southern Hardwood Traffic Association is making an effort to secure lower rates from Memphis and Mississippi points to New Orleans from 12 and 11 cents to 11 and 10 cents, respectively. If this body is successful in this effort, the rate by way of New Orleans to the Panama canal will be 51 cents instead of 52 cents, further increasing the discrepancy between water and all rail rates.

Lesson From North Carolina

No well-informed person now denies that it hurts a region to strip it of timber, bare the soil, and turn the elements loose to work their will upon. It was not many years ago that persons could be found who maintained that forests had little or no influence in regulating streams. Some of the arguments against that untenable doctrine died hard; but facts were against them, and they finally failed to get further hearing from the public. Since then there has been general recognition of the fact that the forest cover and the vegetable blanket of a region cannot be destroyed without suffering serious consequences.

One of the best examples of vegetable cover's effect on the soil's value is found in the Piedmont region of North Carolina. The people there are spending millions of dollars to restore the fertility of the farm lands which have been well nigh ruined by soil washing. In early times the bottom lands along the creeks and rivers were extremely valuable for agricultural crops, principally for corn and hay. The uplands were cleared and were devoted to growing cotton, tobacco, and other crops suited to that kind of soil. That was one of the richest agricultural regions of the United States.

Year by year the rains beat upon the bared fields and slopes, where no measures were taken to check erosion. The North Carolina Geological Survey has estimated, in a sample area of one hundred thousand acres, that the washings of the soil—and the most fertile part of the soil—amounts to eight hundred pounds per year. That much is lost for all time from the upland fields, and it has constituted a drain which no land could long endure without becoming impoverished. The inevitable result arrived, and was seen in the gullied and abandoned fields where formerly the finest crops grew.

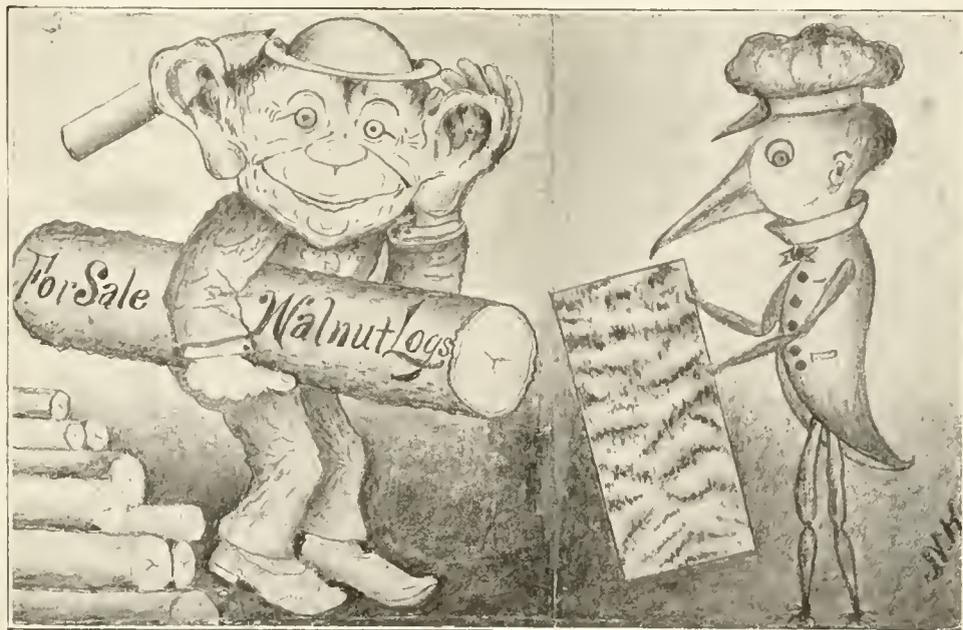

That is only half of the result. The rich bottom lands were too flat for erosion, but they met with disaster also. The thousands of tons of soil which annually washed down from the uplands reached the creeks and rivers flowing through the valleys. The currents were not strong enough to carry the sediment out to sea, and it lodged in the channels, filled them year by year, and turned the water from the former channels out upon the farms. Corn fields became swamps, and meadows were converted into ponds. Reeds, rushes, and worthless thickets, etc., encroached upon the diminishing farm areas until farm after farm, and finally most parts of the valleys, were abandoned. The farmers individually could do nothing. The problem was too large. The situation developed gradually. The full extent of the disaster did not strike all at once, or in all places at once. It was an encroachment which acted so slowly that public attention was not fixed upon it until the ruin was widespread.

The people of that part of North Carolina have at last taken action.

The state geologist, J. H. Pratt, and the state forester, J. S. Holmes, are leading the movement for reclamation. The valleys are being drained, channels for the rivers and creeks are being excavated, and the pestiferous, mosquito-infested swamps are disappearing, and the dried land is again fit for cultivation. It is wonderfully fertile. The accumulations of sediment in washings from the uplands have formed a deep soil on the floors of the valleys which were so long overflowed on account of the choking of the drainage channels. It costs the owners from fifteen to forty dollars an acre to have the land reclaimed; but either that had to be done or the land totally abandoned.

The uplands have been hurt by too much drainage, and the problem

is to lessen it, and stop the excessive washing. It is planned that slopes and old fields which are excessively gullied and eroded be turned into forest, and allowed to grow timber perpetually. Shortleaf pine and black locust are recommended for that purpose. Such land will grow valuable crops of timber, but should never again be cleared for fields. Other slopes which are not so steep or so badly washed are recommended for permanent pastures or meadows. Erosion is not apt to attack a sodded slope. Other areas on rolling ground and moderate slopes are to be set apart for farm crops, but plowing should be deep in

The Black Walnut log man, and the Bird-eye Walnut and fancy figured veneer man, now meet and exchange happy congratulations upon the fact that walnut, as a superior cabinet and finishing wood, is again returning to its own. They listen with pleasure to the favorable comments everywhere expressed, proclaiming walnut, as of old, the peer of all woods, the king of brown woods, yes, the wood of the hour. So plentiful, too, that manufacturers are assured an ample supply for all their needs for many years to come, 50,000,000 feet or more, according to demand, being a conservative estimate of the yearly output of the country.

order that the rain may soak into the soil instead of rushing off in such volume as to form gullies, and the soil should be enriched and bound together by occasional crops of clover or other legumes.

These measures which are being recommended and in part carried out will redeem most of the land which has been injured, and will safeguard it against similar injury in the future.

The war of the substitutes is a battle which is waging in fierceness almost equaling that which characterizes the more bloody encounters abroad. It is a battle which has every likelihood of being waged on this basis indefinitely, and the opposing forces must each have their advances and their losses. It is entirely likely that lumber will lose a number of markets in part at least, which heretofore it has considered as its own by right of custom. However, this belief is rapidly being dissipated by the actual substitution of competitive materials, and from a strategic point of view there is but one logical course to take. All lumber products are hopelessly and admittedly faced by competition of substitutes, which either rightfully or wrongfully have gained popular demand. It is useless to continue the battle when the money might much better be spent in finding other uses for lumber which heretofore have not been taken full advantage of.

While your thoughts are naturally directed to distant fields of conquest, don't overlook the opportunities at home.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 817—Wants to Buy Oak Dimension

Springfield, Mass., Nov. 4.—Editor HARDWOOD RECORD: Will you kindly advise us giving the addresses of mills who are making a specialty of getting out dimension oak, both quartered and plain? We mean especially for chair backs, legs, etc.

Interested parties can have the name of this correspondent by addressing HARDWOOD RECORD.—EDITOR.

B 818—Wants to Buy Core Stock

New York, N. Y., Oct. 27.—Editor HARDWOOD RECORD: We would like to hear from some mills that supply soft, white core stock, basswood preferred, that would be suitable for the manufacture of matches.

Interested parties can have the name and address of this concern by writing this office.—EDITOR.

B 819—Wants to Buy Small Maple Dimension, Principally 1-Inch Square, 16 inches Long

Aurora, Ind., Oct. 28.—Editor HARDWOOD RECORD: We wish to get in touch with some manufacturers making a specialty of cutting small maple dimension stock, principally pieces 1" square by 16" long. Can you give us the addresses of any firms in this line of business?

This is a responsible consuming concern. Interested parties should write HARDWOOD RECORD.—EDITOR.

B 820—San Francisco Hardwood Company Wants Southern Mill Connections

San Francisco, Oct. 21.—Editor HARDWOOD RECORD: We are desirous of shipping considerable hardwood through the Panama canal from both Mobile and New Orleans. Will you kindly advise us if you have a list or directory of sawmills cutting oak, ash, hickory and gum that would be in the neighborhood of these two cities or could you give us any information of the sawmill industries of these two states?

B 821—Wants to Buy Oak Dimension

Grand Rapids, Mich., Oct. 26.—Editor HARDWOOD RECORD: If convenient, will you kindly mail us a list of oak dimension manufacturers? We are in the market for several items in dimension oak and would be pleased to get in touch with some of the mills.

B 822—Wants Clear-Grained White Ash

Boston, Mass., November 6.—Editor HARDWOOD RECORD: Would like to get a list of mills that manufacture 7"x1"x5'6" wide, close-grained white ash. If you will give us the names of mills manufacturing such stock, we will greatly appreciate it.

The above inquirer is a well-rated concern, and interested parties can have the name and address by writing HARDWOOD RECORD.—EDITOR.

B 823—Wants to Buy Two-Inch Standard Walnut

Toronto, Ont., November 7.—Editor HARDWOOD RECORD: We are looking for a large quantity 2-inch standard walnut. If you have on file a list of dealers in walnut and care to let us have same, we will greatly appreciate the kindness.

Walnut handlers can have the necessary information by addressing HARDWOOD RECORD.—EDITOR.

B 824—Dimension Oak

Little Rock, Ark., November 7.—Editor HARDWOOD RECORD: We are in the market for several cars of air-dried mixed oak 2 1/2 x 2 1/2-30".

Anyone interested will be supplied with the inquirer's address upon application to HARDWOOD RECORD.—EDITOR.

Clubs and Associations

Cypress Meeting Postponed

Geo. E. Watson, secretary of the Southern Cypress Manufacturers' Association, announces the postponement of the meeting of that organization from Wednesday, November 18, to Wednesday, December 2. This meeting will be held at the Grunewald hotel, New Orleans, beginning at 10:30 a. m.

The postponement was for the purpose of bringing about a larger

attendance than would have been present had the original date been adhered to.

Veneer and Panel Association to Hold Annual Meeting

The annual meeting of the National Veneer & Panel Manufacturers' Association will be held as usual at the Auditorium hotel, Chicago, December 8 and 9. Complete plans for the program of the sessions have not been issued as yet, but there is assurance that there will be an instructive and satisfying list of subjects presented for talks and discussions.

Gum Meeting January 16

J. M. Pritchard, secretary of the Gum Lumber Manufacturers' Association, announces that the board of directors has decided upon Saturday, January 16, as the date of the annual meeting of the Gum Lumber Manufacturers' Association. The meeting will be held at the Hotel Gayoso, Memphis, Tenn. In addition to the routine of business it is planned to have an interesting program, including addresses on the question of kiln-drying lumber and cost of production.

Mr. Pritchard will issue a formal program of the meeting at a later date.

Indiana Hardwood Men Hold Committee Meeting

The executive committee of the Indiana Hardwood Lumber Association will hold an executive meeting at the Hotel Severin, Indianapolis, on Wednesday, November 11. On this occasion the date of the 1915 convention will be decided on. The Hotel Severin has already been selected as a meeting place.

Chicago Organizations Amalgamated

A few days after the last issue of HARDWOOD RECORD the Lumbermen's Club of Chicago at a special called meeting decided that, owing to the similarity of interests between it and the Lumbermen's Association, and also owing to the lack of necessity for maintaining different quarters in the new Lumbermen's building, the charter of the club will be surrendered and the club as at present organized will be disbanded about April 1. It had been originally planned to have commodious quarters in the Lumbermen's building adjoining the quarters of the Lumbermen's Association.

The association held a dinner and meeting at the Hamilton Club on the evening of November 4. Dinner was served in the main dining room and was followed immediately by the meeting. Plans were discussed relative to the proposed change to go into effect upon the movement into new quarters. As it is now planned the association will take over the quarters to have been occupied by the club, and in order to provide additional funds dues will be raised from \$40 to \$50 a year and an associate membership feature will be inaugurated. Associate membership of individuals will be \$25 a year.

At this meeting the following resolution amending the by-laws was unanimously adopted:

RESOLVED, That the by-laws of the Lumbermen's Association of Chicago be, and the same are hereby amended as follows:

ARTICLE III

The present Section 3 to be hereafter known as Section "4."

At the end of Section 2 insert a new section as follows:

Section 3. Any person in the employ of any firm or corporation holding a membership in this association, and who is not a member of such firm or officer of such corporation, may, upon the request of his employers and by a majority vote of the board of directors, be admitted to associate membership.

Any person employed by the lumber trade journals or by lumber trade associations may apply and by a majority vote of the board of directors be admitted to associate membership.

Associate members shall have all the privileges of the association except the right to vote and hold office.

ARTICLE VI

Change Section 1 to read as follows:

Section 1. The annual dues for resident membership in this association shall be \$50, payable semi-annually in advance.

Change Section 2 to read as follows:

Section 2. The annual dues for non-resident membership and for associate membership shall be \$25, payable annually in advance.

Cleveland Lumbermen Active Against Substitutes

HARDWOOD RECORD has received from the secretary of the Cleveland Board of Lumber Dealers, Cleveland, O., the following letter, which is self-explanatory. This is but one of the many evidences of resentment which have been stirred up by the efforts of the wood substitute advocates to utilize unfair means of advancing the interests of their material:

There has been recently organized in the city of Cleveland The Society advocating Fire Elimination (Safe), which society is made up of builders' supply and brick houses. The organization is very active, with a paid secretary, and is being very substantially supported by the manufacturers, through the state, of brick, cement, tile, etc. The ostensible and laudable purpose of the organization is, as its name implies, the elimination of fires, and we might add that in our opinion the lumber fraternity is as one, as are all good citizens, in wishing to lessen fires in the community. To the extent of agreeing that in downtown and badly congested districts fire-proof material and heavy mill construction should prevail, we can go, but the society in question is not satisfied with a restricted area of operation, but is doing everything possible to enlarge the fire districts or fire limits of the city so as to take up the residential portions. We consider this as very unfair to the lumber trade and entirely uncalled for from a practical standpoint. We are organizing for the purpose of putting before the public the arguments in favor of lumber and its long record of immunity against fire in residential and also

business districts. We, however, realize that the movement to enlarge fire districts and eliminate wood and lumber is not a local situation, but is nation wide. In our opinion, all of our trade journals should awaken the lumbermen throughout the country to the great danger to their interests of the radical movement of the builders' supply interests.

We hope that you will be able to give some space to the matter in your issues and in connection to bring out everything possible in the way of arguments for lumber. Those arguments are many and if the lumbermen are not caught napping, we believe that a great many radical measures to their detriment can be successfully met.

Exporters' Association to be Reimbursed by England

The National Lumber Exporters' Association has been successful beyond all expectations in the handling of claims against the British government for the seizure and diversion of shipments of hardwood lumber since the beginning of the war. When hostilities broke out, it will be remembered, a number of steamers were on the way over with consignments of lumber, and these vessels were stopped and diverted to ports other than those to which they were destined with the result that in many instances the chances for disposing of the lumber became greatly impaired, if they were not actually closed, and even after the release of such shipments the shippers faced serious losses. All such claims were promptly taken up with the British government through the foreign representative of the association, Frank Tiffany, who makes his headquarters in London, and he was so successful in his efforts as to secure the release of all of the shipments thus seized, the government also agreeing to pay the shippers the difference between the price which they stood to receive and the one actually realized on sales. Furthermore, Mr. Tiffany managed to get the Admiralty courts to award the cost of docking, so that the shippers were relieved of this charge. As to the numerous shipments diverted to other ports, various questions enter into consideration which are still in process of negotiation. One of these problems is that of payment of freight charges, the shippers contending that the steamship companies having failed to deliver shipments at points designated in the manifests, the shippers should not be held liable for the freight. It has been proposed that the British government pay one-half of the expense of sending shipments to the original destinations, and this proposition may be accepted. Various other questions are being discussed, and the spirit of conciliation so far shown by the authorities makes the exporters feel entirely hopeful that a satisfactory understanding with respect to all disputed questions will be reached. The success which has attended the negotiations of Mr. Tiffany so far contrasts strongly with the results secured by individual and unaided effort. In many such cases there is as yet no near approach to a settlement, and these matters are likely to be long drawn out, with the result that opportunities to realize will be lost. The benefits of membership in the association are held to have been shown in a most signal manner, and in this connection is pointed out that exporters will be helping themselves not less than the foreign trade as a whole by affiliating with the organization.

Memphis Lumbermen Win Praise for Their Optimism

There were seventy-five members and guests present at the regular semi-monthly meeting of the Lumbermen's Club of Memphis, held at the Hotel Gayoso, Saturday, October 31. The usual luncheon was served and the occasion proved highly enjoyable. J. D. Allen, Jr., was in the chair. John W. McClure, chairman of the river and rail committee, reported that he and his associates held a meeting during the past week in connection with the efforts to secure a longer time than one year for reshipment over the Louisville & Nashville Railroad in connection with the milling-in-transit privilege. Mr. McClure also reported that there was some discussion regarding the proposed advances from southern points to Ohio river crossings but that no action was taken beyond the recommendation to members of the club to lend every possible support to the Southern Hardwood Traffic Association, which is leading the opposition to higher rates.

The entertainment committee reported that all arrangements had been completed for the dance to be given at the Hotel Chisea Tuesday evening, November 3. This committee has been unusually successful in arranging for delightful entertainments.

One application for active membership was reported, that of J. O. Goshorn of the Dugger & Goshorn Company of Memphis. Vote on this application will be taken at the next regular meeting of the club.

President Allen took occasion during this meeting to compliment the members of the club on the very optimistic spirit which has prevailed among them during the crisis which began after the outbreak of the war in Europe. He thought that the fact that they had gone ahead and attended to business, avoiding pessimistic talk, should be duly recognized and that they ought to be encouraged in this attitude. It was on this ground that he justified the apparent self-praise which he bestowed.

The secretary read a typical letter from Col. Jno. M. Woods of Somerville, Mass., which was in acknowledgement of the handsome cane which was recently presented to him by Memphis lumbermen on the anniversary of his seventy-fifth anniversary.

Hemlock and Hardwood Movements

The Northern Hemlock and Hardwood Manufacturers' Association, with headquarters at Wausau, Wis., published figures at the beginning of October showing the cut and shipment of lumber during the preceding twelve months, and likewise giving figures on wages for the past two years, and the estimate for 1914-1915. During the past twelve months the hemlock cut exceeded shipments by nineteen per cent and the cut of hardwood was forty-seven per cent greater than shipments.

Present estimates indicate that the coming year's output of hemlock logs will be sixteen per cent below that of last year; hardwood twenty-six per cent below and pine thirty-three per cent below.

Average woods wages per month including board at present compare as follows with reports in October, 1911, 1912 and 1913:

	1914	1913	1912	1911
Roadmen	\$22.00	\$20.80	\$29.10	\$27.40
Swampers	22.80	31.00	29.30	26.40
Choreboys	27.00	29.90	28.50	26.00
Sawyers	27.00	34.30	32.00	29.80
Barimen	27.50	35.00	34.50	31.90
Cookes	28.70	32.80	30.80	29.00
Hookmen	29.00	35.60	34.20	31.30
Teamsters	29.30	35.80	34.20	31.40
Top Loaders	34.90	39.60	37.80	34.80
Blacksmiths	52.50	59.25	55.90	54.50
Engineers	66.25	68.88	68.20	73.00
Cooks	66.60	67.50	66.50	64.75

September Lumber Output

The National Lumber Manufacturers' Association has published the September report of cut and shipments by members of the association. The result is given in the following summary:

Decrease in cut during September, 1914, under September, 1913	39,500,000 feet
Decrease in shipments during September, 1914, under September, 1913	69,600,000 feet
Excess cut over shipments during September, 1913	105,500,000 feet
Excess cut over shipments during September, 1914	135,600,000 feet

Last Philadelphia Tournament

The Philadelphia Lumbermen's Golf Club held its last official tournament for 1914 at the Merion Cricket Club grounds, on October 21. An ideal day brought out thirty-eight members, who divided up into nine four-somes and one two-some.

J. Anderson Ross presided at the meeting which followed. After the usual routine business, which included a humorous record of the last meeting by J. Elmer Troth, secretary, the distribution of prizes was in order. To E. B. Humphreys of Harry Humphreys & Son, Camden, N. J., whose record showed 39½ points, was awarded the president's prize, a beautiful solid silver pitcher and tray. F. X. Diebold, president of the Forest Lumber Company, with average net score 77, won the prize of the Lumberman's Review of New York, a handsome suit case. The prizes of the regular monthly meeting were distributed as follows: To Maurice C. Burton, net 72, first prize, a golf vest; Horace W. Smedley, S. P. Bowers and E. D. Swenk tied for second and third prizes, with a net score of 73; after a toss-up Mr. Smedley won a half dozen golf balls and Mr. Bowers a pair of golf gloves. Speeches by the winners of the annual prizes followed.

An unofficial game will be played in November.

E. F. Trefz Addresses St. Louis Club

Edward F. Trefz of Washington, D. C., field secretary of the Chamber of Commerce of the United States of America, was the principal speaker at the first fall business meeting and banquet of the Lumbermen's Club, held at the Planters hotel, on Friday evening, October 23. Mr. Trefz's topic was The New Crisis and the New Patriotism. His address followed the banquet, which was presided over by J. A. Reheis, president of the club.

Mr. Trefz predicted, in the course of his address, that twenty years of unbounded prosperity would follow the close of the European war. He defended big business and was of the opinion that the lack of co-operation between the government and business interests was due to the near-sightedness of legislatures. He attacked what he called illegitimate legislation and said it was time for the people and the government to get together and stop some of the drastic laws the national and state legislatures were enacting. It was necessary for a large merchant marine to care for the immense business of the country.

A resolution favoring the support of a bond issue to complete the free bridge was passed. A number of the invited guests were called on to express their views and they were unanimous in their support of what Mr. Trefz said.

Hoo-Hoo Comes to Life

John J. Rumbarger, who has been selected as vicegerent snark of the eastern district of Pennsylvania, is alertly on the job to build up the Hoo-Hoo organization in the East. Mr. Rumbarger was the first vicegerent snark to manipulate the founding of this popular association here some years ago and under his efforts it was a success for a time, but the interest gradually died out and finally collapsed altogether. Mr. Rumbarger proposes to eliminate certain objectionable features which began to mar the organization and evidently deterred many from becoming members. A new feature will be the desired attendance of the wives and sweethearts at all the banquets and dinners of the season. This is a wise move of John's as he knows intuitively that where the ladies are there also will be the men. The alluring program given out by Mr. Rumbarger is as follows:

- First concatenation Friday, November 13, 1914, followed by a banquet. Cross-eyed waiters in attendance.
 - Second concatenation Saturday, February 13, 1915, followed by banquet. Left-handed waiters in attendance.
 - Third concatenation Thursday, May 13, 1915, preceded by a plank and shad dinner. Bow-legged waiters in attendance.
- John is out hustling for kittens, and much purring and spitting is the outlook.

With the Trade

Tom Moore Now Selling Pacific Coast Lumber

T. A. Moore, who has gained a favorable reputation among a wide list of acquaintances in the hardwood, cypress and pine trade in the North and South, recently took charge of the Chicago office of the Pacific Lumber Agency. The position was formerly held by T. P. White, who is now taking care of Iowa and adjacent territory. Mr. Moore gained his reputation locally through his connection with the Louisiana Red Cypress Company of New Orleans. He has been prominently connected in important capacities with the lumber trade for a number of years and has been connected with Geo. T. Mickel, Colonial Lumber and Timber Company, and later operated under his own name as the T. A. Moore Lumber Company. His latest connection was with the Stillwell Lumber Company, of which he was secretary.

Death of Mrs. Hannah Underhill

The lumber world regrets extremely to hear of the death of Hannah W. D. Underhill, wife of Frederick S. Underhill of Wistar, Underhill & Nixon, Philadelphia, which occurred on October 26 at her home, 25 East Strafford avenue, Lansdowne, Pa., after a brief illness. Mr. Underhill is an important factor in the lumber industry and is frequently elected to attend conventions throughout the country to argue upon important questions relative to the advancement or detriment of the trade. The heartfelt sympathy of a large circle of friends is extended him in his bereavement.

Frank C. Gillingham

One of the oldest lumber merchants in Philadelphia, Frank C. Gillingham, president and founder of the Frank C. Gillingham & Son Company, Richmond and Norris streets, died on October 30, at the age of seventy-four years. The loss is much regretted in lumber circles here, as Mr. Gillingham had been for so long a familiar and important factor in the lumber trade, esteemed throughout for his business ability, activity and unimpeachable integrity. It is the custom of the Lumbermen's Exchange, on the last afternoon of the old year to observe the occasion by a social reunion featured by an elaborate luncheon and entertainment of varied character. In 1911 the affair took the form principally of an ovation to Mr. Gillingham, as at that time he had completed his fiftieth year in the lumber business, and many were the complimentary tributes which he received in honor of his long and efficient career among them.

During the Civil war Mr. Gillingham served as first lieutenant of the 119th Regiment, Pennsylvania Volunteers, and was an active member of the military order of the Loyal Legion. He was a member of the Lumbermen's Exchange and of the Union League from its inception many years ago, and for a number of years one of its directors. He was elected president of the Sawdust Club, a select organization of lumbermen who are also members of the Union League, from its beginning, and continued in the office up to his death. Mr. Gillingham was ever noted for his deep interest in charitable organizations of his city, giving freely of his time and money. He was a widower and leaves three children, two sons, one of whom was at one time connected with the firm, and a daughter. Mr. Gillingham had a beautiful home at 5401 Wayne avenue, Germantown.

Death of Bedna Young

Bedna Young of Young & Cutsinger, Evansville, Ind., met a sudden and untimely death on Friday, October 6, due to a collision between a new automobile, which he with a machinist was demonstrating, and a passenger train on the Chicago & Eastern Illinois railroad. The accident happened almost within a stone's throw of his office at the junction of Morgan avenue and the Chicago & Eastern Illinois railroad. Mr. Young had just purchased a new car and, accompanied by Mr. Berendes, was taking his initial ride. At the point where the accident occurred there are several parallel tracks, the crossing being at the north end of the Belt yards. The main line of the railroad runs along the east side of the yards. The crossing was blocked by cars being moved about by a switch engine. They had stopped before going onto the tracks to await an opening to go across. It is supposed that the noise of the switch engine drowned the whistle of the approaching passenger train, and without being aware of any danger the automobile was driven onto the track, resulting in its complete destruction, the instant death of Mr. Young and probably fatal injuries to the mechanic.

Mr. Young was born in Shelby county, Indiana, January 23, 1868, and started in the lumber business at Edinburg. He later moved to Grammer where he was associated with Daniel Wertz, now of Maley & Wertz of Evansville. He later moved to Boonville, where he was a member of the C. P. White Lumber Company. Ten years ago he came to Evansville and became associated with F. M. Cutsinger in the firm of Young & Cutsinger, of which firm he was a member at time of his death. He was also a member of the firms of the J. W. Waltman Lumber Company of this city, Young & Cutsinger Company of Jackson, Tenn., and was vice-president of the W. T. Thompson Veneer Company of Edinburg, besides having other local interests. He took an active interest in association work, being vice-president of the Indiana Hardwood Lumbermen's Association, and was formerly president of the Evansville Lumbermen's Club. He took an active interest in Y. M. C. A. work, being second vice-president of the local branch.

Mr. Young leaves a widow and an adopted son. He was a member of St. Marks Lutheran Church of Evansville, and for several years was superintendent of the Sunday school.

Interment took place at the Oak Hill cemetery, Evansville, Monday afternoon, November 9. The services were held at one-thirty at St. Marks Lutheran Church, Rev. J. C. Schaub of that church and Rev. Wm. G. Sweeney of the First Christian Church officiating. At the Sunday services at St. Marks formal resolutions on Mr. Young's death were adopted and it was announced that a bronze tablet will be given a place in the new structure now being erected, commemorating the many years of faithful service of the deceased.

Mr. Young was a man who was beloved by all who knew him. He lent a kindly ear to all his employes and there was none but felt he was welcome to an audience with him if there were any complaints, and they did not hesitate to take him into their confidence. He was always of good cheer and his comradeship was enjoyed by all those who were associated with him.

Mrs. Fred A. Diggins

Mrs. Fred A. Diggins, widow of the late F. A. Diggins of Cadillac, Mich., died a week ago at the Diggins' home in Cadillac. She had been in poor health for several months and her death was probably hastened by the sudden passing away of her husband. Interment took place on Monday, November 3, services being conducted by the pastor of the Con-

T. A. MOORE, IN CHARGE CHICAGO OFFICE
PACIFIC LUMBER AGENCY

THE LATE FRANK C. GILLINGHAM OF
PHILADELPHIA, PA.

THE LATE BEDNA YOUNG OF EVANSVILLE,
INDIANA

gregational church at Cadillac. Mrs. Diggins was born in Croton, Mich., on September 29, 1866. She is survived by two daughters, Mrs. Donald B. McMullen and Miss Dorothy Diggins.

Grand Rapids Veneer Works Places Equipment in Flooring Factories

HARDWOOD RECORD has received information to the effect that the Grand Rapids Veneer Works, Grand Rapids, Mich., has made rapid progress of late in installing its dry-kiln equipment in flooring plants. The most recent installations are in the mills of the Mowbray & Robinson Company, Quicksand, Ky.; National Interior Finish Company, Huntington, W. Va.; Hewitt & Boden Company, Athens, O., and the Federal Parquetry Flooring Company, Lexington, Ky. The Grand Rapids firm writes that its business for the year has been all that has been anticipated and that it believes hardwood manufacturers are keenly alive to the necessity for having better dried stock.

J. H. O'Melia Buys Partner's Interest

J. H. O'Melia of Rhineland, Wis., has purchased the interests of his former partner, Chas. A. Conro, and is now operating as a manufacturer and wholesaler of lath, pine, hemlock, spruce and hardwood lumber, and other special items. The new firm style is the J. H. O'Melia Lumber Company.

Mr. O'Melia has been associated with the lumber business ever since he started working. The Conro Lumber Company started business in 1908, but in the last few years Mr. Conro's time has been taken up with outside duties. Mr. O'Melia has, as a consequence, been handling the business of the organization. Realizing that he would not be able to give any time to the lumber business in the next few years, Mr. Conro decided to withdraw from the partnership and his interests were taken over by Mr. O'Melia. This includes all business, stocks, etc.

Mr. O'Melia is twenty-nine years of age and has never followed any other line than lumber. His father was woods superintendent of the Yawkey Lumber Company and later the Yawkey-Bissell Lumber Company at Hazelhurst and Arbor Vitae, Wis., during the entire time these firms were in business, which was for some twenty-two years prior to 1912. When attending school the younger O'Melia's summers were spent in the lumber yards at Hazelhurst, Wis., and after finishing his course at the University of Wisconsin in 1906 he entered the employ of lumber firms in that section working in the yard and office until he formed the partnership with Mr. Conro.

Mr. O'Melia has sent HARDWOOD RECORD notice of the stock which represents the character of lumber ordinarily carried. This includes hemlock in all grades: 1", 2" and 3" and timbers; all grades white pine including thicknesses of 1", 5/4", 6/4" and 2"; tamarack in all grades 1" and 2", 1" spruce and Wisconsin hardwoods running principally to birch, basswood and maple with a little elm and ash. Mr. O'Melia writes he is in position to have any of his lumber milled any way, including resawing, and states that while most of the softwoods are for the retail yard trade, still he has good supplies of crating lumber and factory white pine. He also expects to market the hardwoods direct to the factories. He also has the largest lath stock in the North and makes a specialty of lath shipments in car lots.

Billetter-Nagle

Mr. and Mrs. William Henry Nagle, Philadelphia, Pa., announce the marriage of their daughter Lillian Eckman to Hugh William Billetter on Wednesday, November 4.

Otis-Scoggin

Mrs. William Hamilton Scoggin announces the marriage of her daughter Elizabeth Lee to Joseph S. Otis on November 4. The ceremony took place in the Napoleon Avenue Presbyterian church of New Orleans.

Mr. Otis, as is widely known, is of the Otis Manufacturing Company, New Orleans, which concern operates the largest mahogany sawmill in the world.

The couple will be at home after December 15 at 1021 Audubon street, New Orleans.

Edwards Lumber Company in Receiver's Hands

Suit was filed about a week ago by E. L. Edwards against the Edwards Lumber Company, Dayton, O., asking for appointment of a receiver. E. A. Deem, president of the Miami Lumber & Veneer Company, was appointed in this capacity, and his bond fixed at \$10,000.

In his petition, E. L. Edwards alleges that he is a surety for the company for a large amount, and that the indebtedness is due. He says the company is engaged principally in the export business, and sells the larger part of its product in England, Europe, South America, South Africa, Australia and New Zealand, and that owing to the European

war now existing foreign banking and exchange have become so demoralized that there is no basis or medium of exchange established as yet for the interchange of business, and further, owing to the unsettled business conditions now existing in this country, the company has been unable to sell its product in the usual channels. He states the company has letters of credit and drafts for large amounts against customers in Europe and other foreign countries, which it is unable to negotiate.

He further maintains that with numerous valuable orders on hand for foreign shipment, in addition to the uncertainty of the medium of exchange, ocean freight rates have advanced twenty-five to fifty per cent, also all shipments must carry war risk insurance amounting to two and one-half up to ten per cent. He says that the company is solvent, but is unable to obtain extensions of credit or realize on its assets. He also says that creditors are pressing them for payment of their claims and suits have been filed against the company, and in order that its assets might not be sacrificed and its property depreciated a receiver was asked for.

Forest Service Notes

Henry S. Graves, forester and chief of the Forest Service, will return to Washington next week from his western trip. Mr. Graves has communicated informally some of his impressions to members of his staff in the capital. One of them is understood to be that the government should begin a more active campaign to secure the development of national forests. Settlers have been found to be restless and Mr. Graves probably will recommend advances by the government for road building and the construction of other public utilities that must be had before settlers in any number can be induced to move into the forest sections.

While forest fires have been very few this fall, it is pointed out at the Forest Service at Washington that conditions have been very similar to those of the autumn of 1910, when losses totaled over \$20,000,000. Winds have been very high and there have been many small fires. Improved and systematic methods have proven their worth over and over during recent weeks, it is stated. Automobiles and telephones are reported to have been of greater aid than any two other agencies. Of course the building of roads and trails has been a necessary antecedent of the use of motor cars.

All sawmill operators are being called upon by the Forest Service to furnish information as to character of output, whether it is building lumber dimension stock or vehicle, handle or agricultural implement material. This is being compiled so that when government departments have to apply for bids of any kind of stock the request can be sent only to those in a position to furnish the grade of material wanted.

The Forest Service field party, which has been doing work in a number of southern states, has returned to Washington and the work of compiling the data has been started. The party was in charge of W. D. Brush.

R. E. Simmons, who has been designated by the Bureau of Foreign & Domestic Commerce to study lumber conditions in South America, sailed November 7 from New York to take up his work. For a week before leaving Mr. Simmons called upon lumber exporters in New York and was able to get an exact idea of what shippers

want to know. This item has previously been referred to in a more detailed manner in other issues.

Franklin H. Smith, who is going to the Orient on a similar mission has stopped in Hawaii for an investigation of lumber conditions there. On concluding this he will take up his investigation in Japan and China at once.

A representative of the Italian state railways has arrived in this country and is looking into the cross tie situation here.

O. T. Swan of the office of Industrial Investigations of the Forest Service, will return to Washington November 15, after a personal investigation of the questions of Douglas fir grading. On his way to the Pacific coast he conferred with representatives of furniture factories in regard to several important matters, which are expected to lead to important investigations.

J. B. Knapp of Portland, Ore., secretary of the Northwestern Association of Box Manufacturers, is in the East studying the possibilities of the market for the product of his association. The opening of the Panama canal has given the northwestern manufacturers their long wished for chance to have an opportunity to compete for the eastern market and in order that their campaign may be laid along intelligent lines, Mr. Knapp is looking carefully into all matters affecting the situation.

Mississippi Mills Begin Operating

The two latest additions to the active operating trade of the state of Mississippi are the hardwood and pine mill of W. P. Goolsby, Lafayette Springs, and the hardwood dimension mill of C. E. Ford of West Point.

J. H. O'MELIA, OF THE J. H. O'MELIA LUMBER COMPANY, RHINELANDER, WIS.

Kimball-Lacey Opens Chicago Office

The Kimball-Lacey Lumber Company of Arkansas City and Memphis has taken office room at 2024 Railway Exchange building, Chicago. T. B. Coburn, who has been at the office at Arkansas City, will have charge of the Chicago business and will take care of trade in Illinois and Missouri. Mr. Coburn requests that inquiries from this territory be sent to him at Chicago.

Lumber Company Involved in Unfortunate Suit

Arguments in the litigation of the Paepeke Leicht Lumber Company versus Geo. Leavenworth were heard last week in the supreme court of the United States. A valuable tract of hardwood timberland in Coahoma county, Mississippi, is involved. The land was sold the lumber company in good faith by J. F. Smith, the evidence showed, but Leavenworth developed what he alleges to be a prior claim. Leavenworth asks for an injunction to prevent the removal of timber by the lumber company.

Pertinent Information

The Kauri Gum Industry

Kauri gum is used in making some of the best varnishes, and the United States buys more of the gum than any other country. A change in the method of grading is proposed, and it is not meeting with unqualified approval. The gum is mined in New Zealand on tracts where forests of kauri pine once grew. The resin resisted decay and is now found mixed with the soil. It is taken out by surface diggings, and is of several qualities. A recent consular report from Auckland, New Zealand, says that the report of the commission appointed by the New Zealand government to inspect and classify the kauri gum reserves in the Auckland district has just been issued. The United States took in 1912 3,894 tons, valued at \$1,131,782, out of a total exportation of 7,908 tons, valued at \$1,952,951.

The opinion of exporters of this gum is that this official report is comprehensive and valuable, but, speaking generally, the local firms which buy and grade kauri gum for export do not regard as practical the idea advanced by the commission for the government to undertake grading the gum, claiming that no universal standard would be so satisfactory for the varnish makers as the existing system of long standing.

It is recognized that almost every large buyer of kauri gum has his own special method of preparing the product which best suits his requirements. Exporters think that for the government to undertake the grading would only mean added expense to the industry with no adequate result, as exporters generally would continue to rely upon their own methods of grading, which were adopted to suit their customers.

Interesting Traffic Disputes

A forcible reiteration of the stand of the Interstate Commerce Commission with respect to retroactive application of transit privileges was made in a decision in the case of the Meeds' Lumber Company of Jackson, Miss. This company charged that unjust and unreasonable rates had been charged on certain east-bound lumber which provided for dressing in transit.

The McShane Lumber Company of Omaha, Neb., lost its case when its contention of misrouting and unreasonable rates was not sustained.

A brief was filed last week for Chattanooga, Tenn., lumber shippers in regard to lumber rates between Nashville and Chattanooga. The brief sets forth that the Nashville, Chattanooga & St. Louis Railroad is the shortest line between Chattanooga and Nashville. The distance between the two places is 151 miles. The rate on lumber from Chattanooga to Nashville is nine cents. The rate on lumber from Nashville to Chattanooga is seven cents. The Chattanooga shippers object to paying two cents more and claim that it is a violation of the act to regulate commerce. The brief is filed for the J. M. Card Lumber Company, the McLean Lumber Company and the G. H. Evans Lumber Company.

Thursday at Nashville, Chattanooga & St. Louis Company filed its brief in the case. It is set forth that there are four section reasons for the higher rate from Chattanooga to Nashville. The movement of lumber in this direction is very light in comparison to that moving from Nashville to Chattanooga, it is said. A rate as low as seven cents would affect other and more important traffic adversely, it is declared. It also is stated that the seven cent rate from Nashville to Chattanooga grow out of the intense competition with Ohio and Mississippi river crossings.

Relief from fourth section provisions has been granted, pending investigation, to the Tennessee Central and other railroads respecting rates on cedar pencil wood from Tennessee points to Norfolk, for export. The commission names a rate of twenty-six cents to Norfolk and thirty-six cents to New York, rail and water.

D. K. Jeffris, a lumberman well known in Chicago and in Louisiana, was not able to secure the support of the Interstate Commerce Commission in his charges of unreasonable rates against the New Orleans, Mobile & Chicago Railroad and its connections. In a decision last week, the commission found that the rates charged for transportation of certain shipments of lumber from points in Mississippi to Chicago and Indianapolis were not unreasonable, except in cases where the joint through rates were

in excess of the sums of the intermediate rates to and from Cairo or Thebes, Ill. Reparation for this portion of the haul, on which overcharge was made, was left to be adjusted by the persons interested.

Proposed increases of rates on lumber and forest products on the Missouri & North Arkansas Railway have been suspended until January 28.

The Powell-Myers Lumber Company of South Bend, Ind., has filed complaint with the commission charging misrouting and overcharge.

The Union City Hoop and Lumber Company of Union City, Ind., has filed complaint covering shipments of logs from Ohio points.

The Hollaud-Blow Stave Company of Decatur, Ala., has filed a complaint of overcharge for shipments of stave bolts made between local stations on the Louisville & Nashville.

Bruer Bros. Lumber Company of Minneapolis, won its suit against the Chicago, Milwaukee & St. Paul last week. Reparation was awarded on account of collection by the defendant of a rate for switching in excess of that authorized by its tariff.

The much discussed lumber transit privileges at Buffalo will be the subject of a special hearing at Washington, November 24. Examiner Bradley will take the evidence.

An important ruling affecting the lumber trade was that of the Interstate Commerce Commission in the case of the National Casket Company, versus the Southern Railway. In addition to the attorneys for the complainants, Wm. S. Phippen appeared in the interest of the National Wholesale Lumber Dealers' Association. The features of the decision may be summed up as follows:

Defendant's rules and regulations applicable to transit on lumber at points on its system generally not found to be unduly discriminatory or prejudicial to transit users in western North Carolina, but the refusal to apply the transit rate on small shipments of lumber of a particular kind of wood which, being a part of a mixed carload shipment, weighs less than 1,000 pounds found to be unreasonable.

Defendant's practices in respect to the weighing and billing of shipments of transit lumber moving from Azalea, N. C., found to be unjust and unreasonable.

Transit charge of 2 cents per 100 pounds above the through rate not found to be unreasonable in view of conditions surrounding the service at Azalea, Woodfin, Asheville, Biltmore and Marion, N. C.; nor upon the facts shown to be unduly discriminatory against the latter points as compared with east Tennessee points. Evidence upon which a contrary conclusion was reached in *Spiegel v. S. Ry. Co.*, 25 I. C. C. 71, and *Bristol Door & Lumber Co. v. N. & W. Ry. Co.*, 25 I. C. C. 87, compared and held not to mitigate the controlling effect of the evidence in this case.

After years of effort, log shippers at last have obtained a ruling from the Interstate Commerce Commission providing for an allowance of 500 pounds to cover the weight of standards and supports used in securing logs on flat cars. The decision was rendered in the case of the Berry Lumber and Stave Company of Chattanooga versus the Alabama Great Southern Railroad Company. On most railroads there is a rule providing an allowance of 500 pounds for dunnage used on shipments of lumber on flat, gondola or coal cars. In practically all cases it is specified that no allowance will be made on forest products other than lumber. In its ruling, the commission holds that substantial justice does not require that reparation be awarded upon past shipments of logs. As the rule involved is one of general application, the commission did not enter an order, but will expect defendants to amend their tariffs within sixty days so as to provide for the 500-pound allowance.

The commission has made various adjustments in rates on logs in the deciding of several cases brought by the McLean Lumber Company, of Chattanooga. All the cases were related to the Chattanooga log rates. O. L. Bunn appeared in the interest of the lumber company.

An important question of rates on rough hardwood lumber is involved in the case of the Hugh McLean Lumber Company of Buffalo, versus the Illinois Central and the Chicago, Milwaukee & St. Paul. The lumber company claims various overcharges.

The Berthold & Jennings Lumber Company of St. Louis has entered a complaint alleging overcharge on various shipments of lumber where dressing in transit was specified but was not done.

The Salmen Erick and Lumber Company of New Orleans was advised last week that no exception would be made of its cars in the application of the Safety Appliance act. The lumber company asked to be relieved from placing certain equipment on its logging cars. While it is admitted that in this particular case it works a hardship, the fact that the logging cars are used over a few miles of a line engaged in interstate traffic makes it necessary that all provisions of the act be observed.

The Lambert Lumber Company of Chicago and Minneapolis has filed a reply brief in its case against the Great Northern Railway in regard to coal rates. The R. J. Darnell Company, Inc., of Memphis, has asked reparation of \$512.15 on 107 cars of gum lumber shipped September 16, 1913, to February 25, 1914, from Leland, Miss., to New Orleans for export. It is stated that on December 20, 1912, the Yazoo & Mississippi Valley advanced its rate on gum lumber between Leland and New Orleans from ten cents to eleven cents. Attention is called in the complaint to the commission's order to apply a ten-cent rate on gum lumber, staves and headings, south of the Southern Railway in Mississippi and eleven cents north of that line. Reparation for excess charges is asked.

After the St. Louis Southwestern and its northern connections failed to agree on divisions of rates on lumber and other forest products from points in Arkansas and other states to points in Iowa, Minnesota and other states, the Interstate Commerce Commission arranged the divisions in a report handed down last week. It was decided that the through rates should divide 18 cents to East St. Louis and the balance to the lines beyond. With respect to the rate via the Wabash Railroad, the

same principle was involved and in the determining of the reduced rate to Des Moines the factors ordered used were 18 and 9½ cents or 65.4 per cent to East St. Louis and 34.5 per cent beyond. The result of this is a division to the St. Louis Southwestern of 16.5 cents and to the Wabash of 8.5 cents.

Effect of Recent Rate Advances

While the granting of the request for the five per cent advance in eastern rates will not affect directly the lumber industry in other territory, there is little question in the minds of the attorneys who have been presenting the case before the Interstate Commerce Commission, that the roads serving the great hardwood centers will try to advance rates on the ground of having to give a higher proportion to the roads in the freight territories where advances may be authorized. This is shown in the rate increase which became effective October 26 in Central Freight Association territory. This, of course, includes shipments originating at points on the Mississippi and Ohio rivers, which form the boundaries of the Central Freight Association territory.

While the through rates have not been affected by the advance there are considerable territories in the hardwood section where the rates into Central Freight Association territory are made by a combination of local rates. In these cases the southern lumber will have to pay the increase on the haul north of the Ohio.

All believe that there will be a determined attempt to advance the through rates from the South and Southwest. Proposed advances of southern lumber rates already are under suspension.

Correspondence Regarding Five Per Cent Increase on Lumber Rates

E. E. Hooper, secretary of the Lumbermen's Association of Chicago, sent **HARDWOOD RECORD** the following letter, which was received from the general freight agent of the Chicago & Eastern Illinois Railroad, relative to the proposed advance in freight rates:

"Your attention is called to 'special application' on page 42 of Supplement No. 57 to C. & E. I. R. R. Freight Tariff No. 2800-C. Rates on lumber from Thebes, Thebes Transfer, St. Louis and East St. Louis on traffic originating beyond are not advanced. Only the local rates from these points and points taking same rates are advanced. All rates from Joppa, Ill., Evansville and Mt. Vernon, Ind., and Chicago, Ill., are advanced as per Supplement No. 57.

"There is no change in through rates from points in Section 5 of Tariff 2800-C to points in Sections 1, 2 and 3, nor is there any change in the rate north of Thebes, Ill., on traffic received at Thebes, Ill., from connecting lines."

St. Louis Firms Alarmed Over Rate Advances

Henry A. Boeckler, president of the Boeckler Lumber Company, told the members' conference of the Business Men's League of St. Louis, at one of its weekly meetings held a few days ago, that unless the discriminatory railroad rates enforced against St. Louis were abolished, St. Louis would lose its supremacy as a lumber market and many firms would leave the city. He made a strong appeal to the St. Louis business and financial interests to come to the rescue of the lumbermen and aid in their fights for fair rates.

In part he said that the lumber business of St. Louis was saved in 1906 by the abolition of the bridge arbitrary. It was again threatened by the practice of the railroads in continually advancing rates to St. Louis and not advancing them to other markets. He stated that in 1911 the railroads made an increase of one cent a hundred pounds on the freight rate but increased the rates to no other point. Although the

lumbermen fought the advance they lost out in their fight. The lumbermen thought that the railroads needed the money and would advance rates to other points but instead of doing this, they added another cent last December. These rates, on complaints filed with the Interstate Commerce Commission, have been suspended until January 28, 1915. If the proposed rates are permitted to stand, the lumber business of the city will suffer great injury and much of the business now done by St. Louis concerns will go to Memphis, Cairo and Chicago.

Plea for Just Log Rates

Rates on hardwood logs from points on the Chicago, Rock Island & Pacific to Memphis are said to be unreasonable and unjustly discriminatory by Memphis hardwood manufacturers in a complaint filed recently with the Interstate Commerce Commission. The manufacturers submit a scale of rates which they consider reasonable. It is claimed that the rates now in force greatly restrict the quantity and size of shipments of logs. The following rates are suggested by the Memphis manufacturers:

Distance	Rate per 100 pounds
10 miles and under.....	3 cents
25.....	3
50.....	3½
75.....	4
100.....	4½
125.....	5
150.....	5½
175.....	6
200.....	6½
225.....	7
240.....	7½
250.....	7½
260.....	8
275.....	8
280.....	8½
300.....	8½
325.....	9
350.....	9½
375.....	10

The complainants also set forth that they will not oppose the establishment, by the defendant, of a transit arrangement similar to that in effect on other important log carrying roads entering Memphis, under which certain gross or bonded rates are collected in the first instance upon logs. A portion of these charges are refunded when the production of these logs is reshipped via the rails of the carrier delivering the logs.

There is an imposing list of names signed to the complaint. They are: Memphis Band Mill Company, Anchor Saw Mills Company, I. M. Darnell Son Company, Dudley Lumber Company, Dugan Lumber Company, F. T. Dooley Lumber Company, Gayoso Lumber Company, C. S. Gladden, Goodlander-Robertson Lumber Company, Green River Lumber Company, Kennedy Heading Company, May Brothers, Memphis Veneer and Lumber Company, McLean Hardwood Lumber Company, Moffet, Bowman & Rush, Mossman Lumber Company, Nickey Brothers & Bass, Inc., Nickey & Sons Company, Russe & Burgess, Inc., James E. Stark & Co., J. V. Stimson Hardwood Company, VandenBoom-Stimson Lumber Company and Jno. M. Woods Lumber Company.

Interesting Freight Developments at New Orleans

Exporters of lumber through New Orleans are interested greatly in the Belt Railway at that port. It is the only terminal facility of this kind owned and operated by a municipality in the United States. On the efficacious operation of this belt system much depends, so far as the lumber exporter is concerned. As a consequence, the outcome of the case of the Louisiana Railway and Navigation Company versus the City of New Orleans, which was argued last week in the supreme court, is being awaited with interest by all lumbermen shipping through New Orleans.

The very existence of the Belt Railway is threatened. The city gave certain privileges to the Frisco and the L. R. and N. a number of years ago. Later it was decided that the city had exceeded its jurisdiction and the privileges were withdrawn. The L. R. and N. claims that the rights extended it could not be repealed and brought the action which has been fought through the state courts and is now laid before the Supreme tribunal for decision.

The important case of Kranss Brothers Lumber Company of New Orleans versus the Nashville, Chattanooga and St. Louis Railway will be taken up at a special hearing in Washington November 16. Examiner Horton will hear the evidence. The cases of the Williamsburg Lumber Company versus the Gulf and Ship Island and the F. M. Kirby Company versus the Pennsylvania Company will be heard November 17.

Intelligent Effort to Land New Export Business

Baltimore enterprise is to be credited with a plan which promises to do great things for the foreign business of the United States, lumber included. The plan in question involves the chartering of the steamer Finland, of the International Mercantile Marine Company, a 22,000-ton vessel, for a trip to all the South American and many of the Central American countries on a trade promoting trip. Provision will be made on board of the vessel for some 300 to 400 of the leading business concerns of the country to send representatives, who are to study the special needs and the opportunities offered in Latin America, with a view to establishing connections and making arrangements to supply these needs. To aid the propaganda it is proposed to have on board a display of many of the goods which are likely to be called for in South America, and the party is to be accompanied by experienced financiers, students of international credits, interpreters and others, who will facilitate the work of getting in touch with the South Americans. Stops are to be made

at the principal ports, where the leading trade bodies and representative business men will be conferred with. The steamer has been chartered by the Fidelity Trust Company of Baltimore, but the opportunities of the trip will be available to representative business men from all over the country. The Finland is to leave New York January 27 and Baltimore two days later, going down the east coast and returning along the west coast via the Panama canal some time in April. The entire distance steamed will be about 16,000 miles. The establishment of branch banks and other credit agencies will be undertaken, and it is expected that the exports to South America will be greatly stimulated as a result of the trip. Baltimore is already a large shipper of lumber to South America, and it is thought that these shipments can be greatly added to. There are also excellent chances of introducing factory products of various kinds.

Indian Teakwood

The valuable teakwood of British India was little used for export purposes prior to 1897, but that year it began to take its place as wood for shipbuilding. Its price was then about sixty-five dollars a thousand feet at export points. Its value has steadily increased, and likewise the quantity exported. In 1913 the average price was \$106 per thousand feet, and the value of that year's exports was \$3,017,230. Most of it went to English shipyards. The home demand in India has always been large. The supply is becoming scarce, and large plantings have been made to provide for the future. It is valuable for furniture and also for house finish.

Teak owes its value chiefly to its great durability, due to its large content of resin, which fills up the pores and resists the action of water. When fresh it will not float, but when seasoned floats easily. The oil in the wood prevents its getting waterlogged, and seems also to safeguard it against timber-boring insects. It does not rust iron when worked up with it. It is used for carving, the noted carved kyaungs or monasteries of Burma being prominent in almost every village of any importance. Teakwood is rather coarse grained, greasy to the touch, and has an offensive odor, something like that of decaying shoe leather.

We Are Flattered

It is indeed a distinction to have one's name appear in the "greatest lumber journal on earth," and it is an almost inconceivable distinction to have one's writings quoted in this notable publication.

HARDWOOD RECORD modestly acknowledges this distinction after having read an item in the greatest lumber newspaper on earth entitled "Get Back to Business—Urged." The item quoted is taken from a letter addressed by our modest selves to a number of lumbermen friends requesting that they bring pressure to bear on the papers which they read regularly, aiming toward at least a reduction in prominence of alleged war news. Probably through a misunderstanding as to the original source of the appeal, the greatest lumber journal on earth printed this little item.

May we modestly urge that the perusal of our own unassuming columns might occasionally give a helpful suggestion even to "grandfather" (someone has said grandmother)?

Contract Comes to Michigan

A Canadian builder recently secured a contract at \$100,000 for the carpentry on a new school house in that country, and he found that he could save money by subletting the doors, sash, and frames to a Michigan firm. It was shown that the doors, after the duty had been paid, cost less than the price at which they could be manufactured in Canada.

Coloring Growing Wood

A correspondent of an English lumber journal writing from India describes an experiment in coloring artificially the wood of trees while in a growing state. By running a system of boreholes right through the trunk, stopping one end with cork, and introducing a dye, the tree may, it is asserted, be made to absorb the coloring matter. Thus the aniline dyes of malachite green and methylene blue colored birch evenly, and eosin veined the wood with red. As the darker shades in wood have a higher value than the lighter, it is considered possible that by impregnating, for instance, a tannin-free wood like birch or maple with a tannin solution during growth, it would later be easy to give these woods a rich dark tint similar to that of the oak, which is rich in tannin, by means of treating it with ammonia under pressure.

Southern Timber Tables

HARDWOOD RECORD is in receipt of an interesting and concise pamphlet with the above caption, which describes timber tables for southern white cedar, southern pine and southern Appalachian timber. The booklet is published by Howard R. Krinbill of New Bern, N. C., and the tables are a result of his own investigations and actual woods experience. Mr. Krinbill has become well known as a timber statistician and has done quite a little research work in this direction.

Beside the table notations, this book gives some helpful suggestions for solving various problems which confront those interested in timberlands. For instance, he hinges the financial problems mainly on computations with the number 71. He says "many problems in forest finance may be solved mentally by remembering that the investment doubles as soon as rate of interest or increment times number of years equals 71. In other words, he gives as a formula the following: Seventy-one over the number of years equals percentage, and seventy-one over percentage equals the number of years.

Dry-Kiln Truck Bulletin

An attractive bulletin has been issued by the A. H. Andrews Company, 115-117 South Wabash avenue, Chicago, descriptive of its roller-bearing dry-kiln truck and transfer cars. The drier department of this company is in charge of C. J. Mural. It is well known that next to the dry kiln itself the apparatus for the economic movement of the lumber in and about the kiln is of the greatest importance, and that it is possible to add enormously to the efficiency of the kiln by the proper handling of the lumber in and out. There must be rapidity and ease of movement, as well as strength, durability and simplicity in the machines. The A. H. Andrews Company has given close and intelligent study to all the details which go to make a complete outfit for this work.

In the first place, all wheels used in the construction of these trucks and transfer cars are of the roller-bearing type wheels of six or seven-inch diameter, are of malleable iron castings, clean and perfect in every respect. Twelve-inch wheels are high grade gray iron, and larger wheels are of cast steel. All wheels are double flanged, unless otherwise specified, and run on rails up to forty-five pounds per yard, or heavier if wanted.

The channel-shaped steel beam is the logical form of construction for all steel dry kiln trucks. The Andrews trucks have side channel beams of three, four and five inches as required by conditions of service and load. The transfer cars have heavy, five-inch side channel beams for track to track heights from nine and a half to fifteen inches. All parts are interchangeable, which is an important feature and adds to the value of the trucks.

Careful attention is given to the bracing of all Andrews trucks and transfers, whereby they are made rigid and reliable. The bulletin fully describes the several styles of trucks, with their parts, dimensions, weights and prices. There is likewise much valuable information in regard to proper dry-kiln management, whereby output can be greatly increased without sacrificing quality or efficiency.

A New Forestry Book

The library of books on forestry has been added to by a work just from the press of John Wiley & Sons, New York. It was written by Frederick Franklin Moon and Nelson Courtlandt Brown, who are professors in New York State College of Forestry, Syracuse, N. Y. The volume contains about 400 pages, is well illustrated, finely printed, and handsomely bound.

The subject is presented from the popular standpoint, yet it supplies the student's wants in the way of technical forestry. The general reader, who never expects to see the inside of a forest school, will find the book entertaining. It gives a good idea of the country's present timber resources, and offers valuable suggestions to those who expect to grow timber for the future.

The college at Syracuse is taking an active part in forestry work, and though intended principally as a working center for the state of New York, its scope of activities is getting in touch with the whole country.

West Coast Ties for Egypt

The British steamer Orange River has been chartered by Thane & Co. of San Francisco, to load railroad ties at Eureka, Cal., and at Puget Sound points for Port Sudan, Egypt. This is the first Pacific coast business for Egypt in many years, and it is a direct result of the war blockade in timber traffic from Baltic and White sea producing regions.

American Pianos in South Africa

Consul William A. Haygood recently reported from Cape Town, South Africa, that the effect of the trouble in Europe opens a field for American pianos in Africa, provided the requirements of the trade are complied with. Germany has been supplying sixty per cent of the pianos in that market, and that trade has ceased for the present. Prospective dealers must study the requirements. The pianos must be comparatively light in weight, low in price, and satisfactory in tone, if they are to take the place of instruments which formerly occupied the market. Heretofore less than ten per cent of the pianos sold in South Africa have been of American make. A publication issued some time ago, "Foreign Trade in Musical Instruments," Special Consular Report, No. 55, gives information on that trade in all parts of the world, and it may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for ten cents.

Not Cutting Pencil Slats

The war has hit hard the rural dwellers in some parts of Tennessee, and they have left off looking for cedar stumps, logs, and fence rails suitable for the lead pencil makers. The slats were sold chiefly in Europe, and the war knocked the breath out of the pencil business the first round. The Tennessee frontiersman, who had worked at cutting pencil slats much as some of the mountaineers of West Virginia labor at digging ginseng, speedily got news over the grapevine telegraph that sales were off, and he quit slatting and turned his attention to other lines of business.

Mt. Mitchell Forests

The state geological survey of North Carolina has made an appeal to the people of that state to take steps at once to save the spruce forests on Mt. Mitchell from destruction by axe and fire. That mountain is the highest point in the United States east of the Mississippi river, and possesses great scenic attractions. The government has purchased the land on both sides of the spruce tracts and has incorporated it in the southern Appalachian park; but the price of the spruce land is so high that the government will not buy it.

The timber is about to be cut, and everybody acquainted with lumbering in the mountains knows that fire will follow the log cutters and will lay the tracts bare, unless measures are taken to provide against such an occurrence. If the upper slopes of the mountain are bared by fire, they will degenerate into waste places, gullied and meshed, until they lose the soil that clothes the rocky skeleton.

The plan is for the legislature to provide laws to protect the forests against fire, so that a force will always be within calling distance if a fire gets under headway. With that precaution, the damage by burning can usually be kept within small limits, and a forest is not destroyed by lumber operations.

The Paint Brush Situation

The upset of trade on account of hostilities has disturbed the brush trade. The paint brush makers are experiencing difficulty in adjusting selling prices to the present cost of the basic material. Bristles from a semiwild hog of Russia and Siberia and also a black hog of China have advanced fifty per cent since war was declared, on account of the practical stoppage of shipments from those countries.

Other hairs used in brush industry are also scarce. Camel hair is dressed only in Germany; the trade of dressing this very fine and short hair requires great skill. It is not known where it can be secured when the present supply is exhausted. Badger skins from which the badger hair is obtained comes entirely from Russia. The advance in this article is nearly one hundred per cent; in fact, it is not a question of what one has to pay, but whether it can be bought at any figure.

Germans and others in and around New York City have been dressing bear hair in large quantities for the past ten years and as a result the trade is not obliged to purchase in Europe. Ox hair, generally called Siberian ox hair, comes from the inside of cows' ears. These ears were formerly taken to Germany, where the hair was cut out, the skin used for other purposes, and the gristle of the ear used for gelatine. During the last few years the dressing of cows' ears has been done in the United States.

OUR LINE WEST VIRGINIA HARDWOODS

Embraces all the commercial species in this region.

Being located right at the mill, we know that *every stick we manufacture is manufactured right.*

We solicit the opportunity of proving this claim and offer the following list which

WE WOULD LIKE TO MOVE NOW:

- 10 cars 4/4 sound wormy chestnut.
- 10 cars 4/4 No. 3 common chestnut.
- 5 cars 5/4 sound wormy chestnut.
- 5 cars 6/4 sound wormy chestnut.
- 3 cars 1/2-inch slack barrel staves, 40 & 42 inches long.
- 1 car 4/4 oak table tops 40 & 42 inches long.

Alton Lumber Company
Buckhannon West Virginia

Fit Props for English Mines

Consul Lorin A. Lathrop, reporting from Cardiff, Wales, says there is a prospective shortage of mine timbers in the south Wales coal fields. This timber is pit wood, imported from France, Spain, and Portugal, and pit props, brought from the Baltic ports of Sweden and Finland. Both are the trunks of conifers, such as larch, Scotch fir, etc., but there is a difference in the way in which they are cut, in the age of the trees, and in the way in which they are marketed in Cardiff.

So many French woodcutters took their place in the French army that production was greatly reduced and exports lowered. The French government is understood to have set soldiers at cutting, lest the Welsh output of coal should be lessened. Supplies of pit wood for the moment are adequate to the demand. It is the shipments of pit props from the Baltic that have practically ceased. The British government is said to have sent a commission to Newfoundland to report on the suitability of supplies from the forests there; and the British Board of Agriculture is inquiring into the possibilities of using domestic growths. Steel props and props made of reinforced concrete have been considered for the permanent ways of the mines, but cost has been found to prevent extensive use. Attempts have been made in the past to import wood from Newfoundland, but ocean freights have been found prohibitive. The extended and constant market, the high financial standing of the importers, and the prompt conditions of payment render this business worth the most serious consideration of American owners of timber lands near to ports of shipment.

Imports into Cardiff in 1913 from Finland amounted to 220,000 loads, being approximately one and one-third loads to a ton of 2,240 pounds; from Sweden, 15,000 loads; from France, 550,000 loads; from Portugal, 250,000 loads; from Spain, 100,000 loads; into Newport, from all countries, 360,000 loads; into Swansea, 150,000 loads.

Pit wood (all from France, Spain or Portugal) consists of the trunks of trees from fifteen to twenty years old, and is shipped green with the bark on. Of the imports, fifty-five per cent is cut to 6½-foot lengths, diameter from 3½ to 8 inches; thirty-five per cent is cut to 9-foot lengths, diameter from 5 to 12 inches. The remaining ten per cent is in 13-foot lengths, diameter 8 to 20 inches. Pit wood is sold by the exporter to the Cardiff importer per metric ton, f. o. b. Bordeaux, Lisbon, Oporto, etc. Prices have usually ranged from \$3.64 to \$4.37 per metric ton, and freights from \$1.21 to \$2.18 per ton of 2,240 pounds, the last named being an entirely exceptional rate. Prices, as between importer and coal mine, during the last few years have run from \$5.34 to \$5.83 per ton of 2,240 pounds, f. o. b. at the Cardiff docks.

Philippine Hardwood Exports

Exports of the famous Philippine hardwoods to the markets of the Orient and to the United States are steadily increasing, and the demands are much greater than the current production can fill. It is estimated that 300,000,000 board feet could easily be marketed outside the islands, while the quantity exported last year was less than 10,000,000 feet.

According to the returns of the collector of customs the value of the timber exported in 1913 was \$9,665; a slight increase over 1912. Lumber has shown an advance in export value from \$63,455 in 1912 to \$214,814 in 1913, the greater part going to the United States. The United States imports chiefly narra and tanguile woods, both being among the best woods obtainable for construction and cabinet work.

The Sumac Crop in Sicily

The Sicilian production of sumac has been constantly decreasing during the past few years. This is attributable to the reduction in price and the increased cost of cultivation. At one time the production amounted to 60,000 tons, while the estimated amount of this year's harvest is about 30,000 tons. Many of the producers have turned to other crops and those who have retained the trees have failed to properly cultivate them, with the result that much of the product is lacking in tannin.

Exports to the United States reached their maximum in 1907 when they totaled 9,500 tons. They later fell to 4,300 tons, and have risen to 5,600.

On account of the war, the exportation to other countries will be reduced, which will probably result in a larger exportation this year to the United States.

The prices, however, are not likely to be lower because of the increased exportation. The increased cost of freight and insurance, as well as the difficulties of exchange, have raised the prices. During the first half of 1913 the price for ground sumac, guaranteed pure, with twenty-eight per cent tannin, was \$53.53 to \$55.96 per ton c. i. f. New York, Boston or Philadelphia; for the latter half of the year the price was \$58.40 to \$63.70 per ton. The prices quoted for the first half of 1914 were \$58.40 to \$63.26. Leaf sumac, on account of additional cost of freight, was quoted \$2.43 a ton higher. The prices at present are \$64.47 to \$65.70 for ground sumac, twenty-eight per cent tannin, c. i. f. American ports. It is believed that if the war should cease the increased demand, together with the scarcity of first-quality sumac, will bring prices still higher.

The United States is not wholly dependent upon foreign countries for its sumac supply. Virginia and other eastern states produce much of it, and the output might be greatly increased. It grows principally in old fields and waste places. It is used in tanning fine grades of leather.

Indiana Oak

GUARANTEED

Do you remember from experience in the old days, that peculiar satisfaction in working the rich, mellow softness and smoothness of *real* INDIANA OAK?

You are probably leary of that term now as you don't *know* the origin of the stock purported to grow in this state.

In fact that very misrepresentation is the strongest endorsement of INDIANA OAK as *the* oak.

You would like to again experience that satisfaction if you could know that the stock you are offered is *just what you used to get*.

Your customers would be pleased if their goods showed that quiet beauty and even color and figure that for all time has given to goods made from INDIANA OAK an individuality.

You can *please them again*. How?

Simply by buying a parcel of almost anything in lumber or Southern Veneers from our yards. You can select from a full assortment.

And remember—We have built up our business by giving

Just a little better quality than you expect

Kansas Avenue Memphis, Tenn.

MATHEWS STANDARD Gravity Lumber Conveyor

Made all steel, ball bearing rollers, twelve foot sections; easily coupled together and assembled to form line of any required length, over which lumber, flooring, dimension stuff, etc., will travel on a four per cent grade. Adjustable jacks supplied to support conveyor line and secure proper grade. Light, strong and easily portable. Been in successful use for past ten years.
Prices quoted on receipt of information as to lengths and widths of materials, and total distance to be conveyed. Send rough sketch showing requirement. Ask for catalog.

Hardwood News Notes

< MISCELLANEOUS >

Descher Gardner Company of New York City has increased its capital stock to \$200,000.

The Buffalo Incubator Company of Buffalo, N. Y., has become an involuntary bankrupt.

The Port Alleghany Furniture Works of Port Alleghany, Pa., announce a change in ownership.

The Honey Island Land Company of Honey Island, Miss., has been incorporated with \$750,000.

The Hanes Chair & Table Company has been incorporated at Mocksville, N. C., with \$25,000.

The American Wood Products Company has been incorporated at Indianapolis, Ind., with \$100,000.

Wm. Fogarty has been appointed receiver for the Weigel Show Case Company of Indianapolis, Ind.

The Faultless Incubator Company, Grove, Okla., has been incorporated with a capital stock of \$15,000.

The Gibson Furniture Company, Mt. Forest, Ont., is reported to be in the market for woodworking machinery.

The Central Cabinet Manufacturing Company, Pittsburgh, Pa., was recently incorporated with \$5,000 capital.

The Cleveland Seating Company of Cleveland, O., is reported to have increased its capital stock from \$25,000 to \$350,000.

J. J. Blake and A. C. Goode have been appointed receivers for the Southern Hardwood Lumber Company, Richmond, Va.

The Western Hardwood Mill Company of Highland Valley, Wash., will move its sawmill to Morton, Wash., and make some extension to it.

Damage of \$100,000 was done by a blaze that destroyed the sash and door factory of Robert Neville, Jr., in the north end of Outremont, B. C.

The Lewis Hardwood Company, Ltd., Lewiston, N. S., has been incorporated with a capital stock of \$50,000. This concern will manufacture lumber, etc.

The United Refrigerator & Ice Company of Kenosha, Wis., has become an involuntary bankrupt, J. D. Rowland and D. E. Callender having been appointed receivers.

Guyton & Phillips, of Orange, Tex., was recently organized by J. D. Guyton and C. E. Phillips to build a plant for the manufacture of hardwood lumber. They have purchased sawmill equipment.

The Windlass Wagon Brake Company of Greensboro, N. C., is the style of a recently incorporated concern with \$100,000 capital stock. This concern will manufacture Windlass brake attachments for wagons and vehicles.

< CHICAGO >

James F. McSweyn, president and manager of the Memphis Band Mill Company, Memphis, Tenn., was in Chicago on business about a week ago.

Frank F. Fee, president of the Fee-Crayton Hardwood Lumber Company, Dermott, Ark., has been spending some little time in Chicago on business of late.

H. P. James, general manager of the Milwaukee Basket Company, South Milwaukee, Wis., was in Chicago on Monday on his way to the basket association meeting at Memphis.

E. D. Galloway of the Galloway-Pease Company, Saginaw, Mich., and Poplar Bluff, Mo., spent some time in Chicago a week ago in conference with M. L. Pease of the same company, who has been spending considerable time in and around Chicago.

M. H. Eichberg of the National Timber Company, Mobile, Ala., has been in Chicago a few days on business.

E. E. Taenzer of the E. E. Taenzer Lumber Company, Memphis, Tenn., made a business trip in the North, and spent a few days in Chicago recently.

H. W. Baker, Jr., of the Baker-Matthews Manufacturing Company, Sikeston, Mo., made a northern business trip last week, and put in a few days in Chicago.

J. H. Faust of the J. H. Faust & Co., Paducah, Ky., spent the past week or so in Chicago visiting the trade.

Hardwood Record is in receipt of bulletin No. 168 issued by the Hardwood Manufacturers' Association of the United States. The bulletin contains a more amplified announcement of the coming meeting of that organization, which will be held at the Hotel Sinton, January 28-29. This will be the thirteenth annual convention and great plans are being made for a successful and instructive meeting. Special invitations will go out to non-members and the secretary requests all members to send in the names of friends who are not members in order that he may send them a personal invitation by letter. It is anticipated that there will be a big attendance of consumers, and members are requested to invite their customers.

The Schultz & Cowan Company of Chicago is reported to have gone out of business recently. W. W. & A. J. Schultz have started a wholesale lumber and pole business on their own account.

The Stewart Wood Finish Company, of Chicago, was recently incorporated with a capital stock of \$30,000.

< BUFFALO >

The burning of 3,610,000 feet of lumber in the yards of Brady Brothers, North Tonawanda, in an incendiary fire late last month, put lumbermen there on guard against any recurrence of such an event and startled everybody connected with the trade in this section. The lumber dealers got together and decided to offer a reward of \$500 to the person or persons furnishing information which would lead to arrest and conviction of the incendiary. Other individual rewards bring the total amount offered up to \$1,100.

The H. T. Kerr Lumber Company has been organized, with \$5,000 capital. H. T. and A. P. Kerr and D. F. Paddock are the directors. The company will look after the cutting and sale of Michigan hardwoods. H. T. Kerr has been in the hardwood trade here for some years and will continue his Pennsylvania hardwood business as before.

The A. J. Chestnut Lumber Company is finding the hardwood trade dull, but there is a fair demand for the hardwood flooring output of beech, birch and maple at its New Hampshire mills.

Miss Evelyn T. Jackson, daughter of Willis K. Jackson of the hardwood firm of Jackson & Tindle, was married at the family home on October 28 to John M. Prophet, Jr., who is connected with the canning firm of Winters & Prophet, Mt. Morris, N. Y.

T. Sullivan & Co. have another cargo of brown ash coming in shortly, this being a wood which is a specialty at the yard. Elm is also being received and orders for it show increase.

The Standard Hardwood Lumber Company has been getting in some stocks of oak and ash from the Cumberland river district during the past month. Trade is called quiet in the different hardwoods.

The Yeager Lumber Company reports increased business developing in cypress during the past month, most of it being used by tank builders. Some elm is also moving.

Miller, Sturm & Miller have been getting in stocks of oak lately. This wood continues to be most in demand among hardwoods, although sales are also being made in maple, basswood and hickory.

M. M. Wall, who is president of the Buffalo Automobile Club, is now busy arranging the details for the motor show which the club will hold at the Broadway Auditorium in January. The exhibition will be the largest the club has yet held and will cover most all kinds of motor conveyances for navigating land, air and water.

< PHILADELPHIA >

The Honaker Lumber Company, Honaker, Va., which is controlled by Schofield Brothers, Philadelphia, was visited by fire on October 17. Frank E. Schofield was on a visit to the plant at the time. Fire broke out at midnight and destroyed the entire plant. The recent heavy rains and the hard work of the bucket brigade saved all the lumber in the yard, which will enable orders to be filled without a hitch. Although no figures could be obtained as to the actual loss, it is learned that the mill was fully insured.

Charles Atherton & Co. have moved from the Bulletin building to 1018 Commercial Trust building.

The Barker-Bond Lumber Company has moved from the Burd building to 613 Commercial Trust building.

William B. Lance of Reading, Pa., formerly with William Schuette & Co., New York, has associated himself as salesman with Charles M. Betts & Co., this city. He will make his headquarters in his home town and look after the coal region and northern New Jersey.

The Fite & Arbelo Company, R. Samuel & Co. and Foreman-Blader Lumber Company filed a petition to have the Carolina Lumber Company of this city adjudged an involuntary bankrupt.

The Garbout Lumber Company obtained a charter under Delaware laws, October 29. It is capitalized at \$1,000,000, its object being to acquire timber and woodlands. The incorporators are from Wilmington, Del.

< PITTSBURGH >

The Pittsburgh Industrial Development Commission has located another industry on the Northside. This will be a big addition to the plant of the Diamond Forging & Manufacturing Company and will employ 300 men. The Commission has located 30 industries for Pittsburgh during the past three years and is now sending J. Rogers Flannery to London to work up English business for its Foreign Trade Commission.

The Kendall Lumber Company is running all its mills and is doing a pretty steady business. President J. L. Kendall and Sales Manager G. M. Chambers were east on a business trip last week.

J. H. Henderson, a well-known hardwood wholesaler, formerly in business in this city and now a member of Henderson Brothers at Clarksburg, W. Va., called on his Pittsburgh business friends a few days ago.

The West Fork Boom and Lumber Company, which has considerable business in this city, has been re-organized with R. B. Newman, president; E. E. Cockrell, vice-president, and George A. Ecker, secretary-treasurer.

The company has a big boom at the month of Steer Creek near Creston, W. Va.

William Seaman, who has been in the hardwood lumber business in Leetsdale, Pa., for many years, has sold out his yards there to Joseph Duitch of Farmington, W. Va., who will take charge at once. Mr. Seaman, although seventy-nine years of age, has been a very active figure in Tri-State lumber business in recent years.

The Allegheny Lumber Company reports business slow but steady, the main difficulty being in low prices. Manufacturers are buying only in small quantities, this company reports.

The West Virginia Lumber Company is running its mill full in northern Pennsylvania and is manufacturing a good number of coal barges for the trade. One consignment of these will be distributed this week from Pittsburgh harbors.

J. N. Woollett, president of the Aberdeen Lumber Company, made a trip through the Middle West lately. He found manufacturers buying much less hardwood than formerly and trying to get low prices. Mr. Woollett says that shipments of gum and cottonwood are fully forty per cent less than at this time last year.

The Breitwieser Lumber Company is getting considerable hardwood business by steady and hard plugging. Manager A. G. Breitwieser of this company believes that business will recover volume rapidly from now on and looks for good times after the first of the year.

The Pittsburgh Lumbermen's Club, which is one of the most up-to-date and aggressive organizations of lumbermen in the East, entertained the members of the Pittsburgh Wholesale Lumber Dealers' Association at a banquet in the Fort Pitt hotel, Tuesday, November 3. The chief entertainer was Attorney J. A. Wakefield of this city, known to all Pittsburgh as a past master in oratory, wit and humor. The subject of his ninety-minute talk was "Personal Experiences in the European War," and was both most entertaining and instructive. Splendid music was furnished and the tables were covered with all sorts of Halloween decorations and presents. President C. E. Breitwieser of the Lumbermen's Club was at his best and Edward Eiler in the absence of President O. H. Babcock of the wholesalers made a fitting response.

← BOSTON →

Geo. F. Welch, who has operated a large lumber business at Scituate, Mass., has incorporated the firm of Geo. F. Welch Lumber Company with capital authorized at \$125,000. Mr. Welch is president and the treasurer is H. J. Wells, who has sold his interest in the L. T. Robbins Lumber Company of Plymouth, Mass., which has been incorporated as the Atwood-Robbins Lumber Company with capital of \$40,000.

The Newton Lumber Company has been organized at Newton, Mass., with authorized capital of \$20,000, E. F. Trudo being president and Horace M. Blackford, Jr., treasurer.

The Essex County Lumber Company has been organized under Massachusetts laws, with the old time lumberman, Geo. H. Swazey, as president. The Indian Lake Lumber Company has been incorporated under Maine laws at the town of Westbrook in that state. Karl D. Scates is president and treasurer.

A notable event among the hardwood lumbermen of Boston was the seventy-fifth birthday reception to Hon. John M. Woods, head of J. M. Woods & Co. This occasion was fittingly celebrated at the Exchange Club and was participated in by many prominent lumbermen, city and state officials, military and fraternal delegates as well as many others among his host of friends.

← BALTIMORE →

Fire which recently broke out in the lumber yard of Harry L. Coffman & Co., at Hagerstown, Md., destroyed a lot of lumber and some sheds, the loss amounting to several thousand dollars, partly covered by insurance.

Mann & Parker, Inc., wholesale hardwoods, have moved their offices from the Continental building to the new yard established on President street, near Allecanna street. The yard runs through to East Falls avenue, and an office structure has been erected on the place. The firm will keep on hand a comprehensive assortment of lumber, and will be in a position to make shipment direct by rail and water.

J. M. D. Heald of Price & Heald, Knickerbocker building, who recently underwent an operation, is reported to be making rapid progress toward recovery, and there is every prospect that he will be fully restored to health.

James Findlay, for many years a member of Steffey & Findlay, Inc., lumber dealers with headquarters at Williamsport, Md., and a branch office at Hagerstown, Md., died November 2 of heart trouble. He was seventy-seven years old, and after graduating from Princeton in 1858 he returned to his native county where he engaged in various business enterprises. He leaves two daughters.

A forest fire which broke out on October 31 on South mountain, Washington county, Md., spread over 1,000 acres of timber, mostly hardwoods. A fire has also been raging on North mountain, near Clearspring.

Fire broke out on the night of October 24 on the third floor of 940 Linden avenue, occupied by Rhein Brothers, makers of carriages and wagons, causing a loss of not less than \$20,000. It is thought the loss will be covered by insurance.

The assets of D. Wilfson & Sons, furniture manufacturers at Howard and Stockholm streets, Baltimore, were sold at receivers' sale on October 29, the continued illness of the senior member of the firm having made a winding up of the business desirable.

S. V. Petersen, representing the well-known firm of Laur. O. Petersen of Copenhagen, Denmark, stopped in Baltimore last week on his way to New Orleans, where he went to look after various matters connected with his firm's affairs.

< COLUMBUS >

According to the report of the Columbus building department for the month of October, there were 201 permits issued, having a valuation of \$649,220 during the month as compared with 271 permits and a valuation of \$590,005 during October, 1913. For the first ten months of the year the department issued 2,409 permits, having a valuation of \$5,502,480, as compared with 2,340 permits and a valuation of \$4,677,088 during the corresponding period in 1913.

Papers have been filed with the secretary of state reducing the capital stock of the Dewey Stave Company of Toledo from \$300,000 to \$30,000.

Papers have been filed changing the headquarters of the Edwards Lumber Company of Cincinnati to Dayton, Ohio.

At Toledo, Ohio, the Gotshall Manufacturing Company has purchased a site of seventeen acres on Derr street; upon it will erect a plant for the manufacture of lumber and building equipment.

The Creston Bending and Ladder Company of Creston, Ohio, has been incorporated with a capital of \$50,000 to manufacture wooden articles by Albert Bihn, E. M. Veil, L. A. M. Pejeau, M. B. Campbell and W. E. Patterson.

The Standard Post and Tie Company of Toledo has been incorporated with a capital of \$10,000 to deal in forest products by F. E. Gibbs, Dean Higgins, V. W. Brinkerhoff, V. N. Robinson and Marie Bacher.

Suit has been filed by E. L. Edwards for a receiver for the Edwards Lumber Company of Dayton, Ohio. The court appointed Edward A. Deam receiver, who gave bond in the sum of \$10,000. The European war is given as the reason for the receivership.

The C. W. Benjamin Company of Sidney, Ohio, has been incorporated with a capital of \$5,000 to deal in timber products by C. W. Benjamin, L. W. Crandall, A. J. Hess, H. K. Hess and E. L. Greene.

The Ritchie-Wertz Company of Dayton, Ohio, has been incorporated with a capital of \$25,000 to deal in timber products by C. B. Wertz, J. E. Ritchie, W. J. Foleman, Carry Wertz and Josephine Ritchie.

The construction of a bridge across the Ohio river at Sciotoville, about eight miles east of Portsmouth, Ohio, has been started by the Chesapeake & Ohio Northern Railroad Company, which will build a new railroad line connecting Columbus and Portsmouth.

R. W. Horton, sales manager for the central division for the W. M. Ritter Lumber Company, reports a fairly good demand for hardwoods when present business conditions are considered. He says buying is about equally divided between factories and retailers and neither are inclined to increase their stocks. Prices are fairly well maintained although some cutting is being done to move stocks where they have accumulated.

J. A. Ford of the Imperial Lumber Company reports a better demand for hardwoods, with prices showing more strength.

< INDIANAPOLIS >

W. M. Fogarty has been appointed receiver for the Weigel Showcase Company, the oldest concern of its kind in the state.

Building operations in the city during October aggregated \$337,689 as compared with \$573,048 in October, 1913.

Fire recently destroyed the mill of the Spencer-Barley Lumber Company at Marion. The loss was about \$10,000, principally to machinery, and was partially covered by insurance.

A contract for a new plant 200x50 feet has been awarded by the Shelbyville Wardrobe Company, Shelbyville, to replace the plant destroyed by fire last summer.

The mill at Huntingburg of J. V. Stimson has reduced its running time from twenty hours to ten hours a day, but no further curtailment is expected at this time.

James G. Young, one of the best-known lumbermen in southeastern Indiana, died at his home in Lawrenceburg a few days ago. He was sixty-four years old.

T. N. Boicourt, president of the Beech Grove Lumber Company, has organized business men of Beech Grove into the Beech Grove Boosters' Club.

< MEMPHIS >

The plant of the American Car and Foundry Company at Binghamton, a suburb of Memphis, has resumed operations recently. This action was taken by reason of an order from the New Orleans & Northeastern Railroad. C. A. Price, district manager, says that the forces employed will be gradually increased until the daily output is up to ten cars. He is of the opinion that still other orders for cars will be received in the near future and is hopeful that it will be possible to keep this plant in steady operation. This is the first car building undertaken by that plant since the latter was seriously damaged by fire several months ago.

Dispatches received here from Paducah, Ky., indicate that the shops of the Illinois Central at that point are running on full time with a

Dimension Stock We will supply you with CLEAR CUTTINGS of soft Kentucky Oak or Poplar so that they will COST you considerably LESS THAN the same cuttings if BOUGHT AS LUMBER.

complete quota of men, 1,000. Some time ago, the Illinois Central found it necessary to lay off a part of its forces at that point, and there is much gratification over the fact that there has been a full reinstatement of all of the men. It is understood that the shops are engaged more actively in repair work than in the making of new cars.

One of the most unique orders which has been received here in recent years is that for 10,000 canes booked by the Kelsey Wheel Company of this city. These canes are to be manufactured from hickory and all are to have the usual crook. Some of them will be manufactured perfectly smooth, while others will be made with the bark on them. This order came from a firm at Detroit, Mich. The material for the manufacture of these canes will be secured largely from Arkansas, the tops of trees and limbs being used largely. This company is engaged principally in the manufacture of wheels and this order is directly in line with its output, especially since it will enable the company to utilize practically the entire tree, the body for wheels and the limbs for canes.

The Building Material Men's Club has recently filed application for a charter here with W. W. Fischer, P. A. Gates, L. J. Myers, R. E. Montgomery and others as the incorporators. Some time ago a number of

those engaged in the handling of building material perfected plans for a permanent exhibit of the various products manufactured or offered for sale here, and the taking out of this charter is a further step in that direction. It is hoped by means of this permanent exhibit to materially increase the consumption of Memphis made material in the construction of buildings.

The Arkansas Veneer Company, at Helena, Ark., has given notice of an increase in its capital stock from \$10,000 to \$71,000. August C. Beck is president and W. E. Cannon is secretary. This is one of the few firms in the southern hardwood territory which has increased its capital stock since the disturbance growing out of the European war.

Announcement has been made that the creditors of the Mississippi Manufacturing Company, Crystal Springs, Miss., have effected plans whereby the plant of this company will be continued in operation. It is equipped for the manufacture of boxes and crates for use in handling vegetables.

The Jennings-Wilson Furniture Company, which has just completed its first year here, has changed its name to the Jennings-Starke Furniture Company. This change of name results from the withdrawal of S. Y. Wilson, former president of the company, who has retired therefrom to take an active interest in the Tri-State Furniture Company. A. E. Jennings has been elected president, Lewis N. Starke has been made vice-president and general manager, and Z. E. Jennings is secretary and treasurer. This is one of the largest wholesale and retail furniture firms in this territory.

The Harris-Brown Table Company, which operates plants at Denver, Col., and Portland, Ore., has purchased the site and plant of the Tallahatchie Furniture Manufacturing Company at Greenwood, Miss. No announcement has been made by the purchasing firm as to whether it will operate the newly acquired plant.

The Memphis Veneer & Lumber Company has recently purchased the entire cargo of one of the vessels arriving from British Honduras, consisting of 3,000 mahogany logs and 152 cedar logs. This company operates a big veneer plant at Memphis and during the past twelve or eighteen months has been engaged in the manufacture of mahogany veneers on a rather large scale.

H. D. Kitchenell, J. J. Green and Oscar Fuller of Greenwood, Miss., have taken out a charter for the Honey Island Land Company. It is capitalized at \$750,000. Although the name suggests that this company has been formed for the purpose of engaging in agricultural pursuits, it is known that it will devote its time almost exclusively to the lumber industry.

E. T. Bennett has sold his interest in the Bennett Hardwood Lumber Company to J. N. Penrod, of Kansas City, and the Abbott Estate, the negotiations having been completed within the past few days. The trade included the plant, the site and all the stock of lumber belonging to the company. Mr. Bennett announces that he will lease the plant and that he will begin operations November 10. He intends for the present to cut from about 700,000 to 800,000 feet of lumber. The lease will not be for any definite period and is made subject to sale of the plant and site by the new owners.

← NASHVILLE →

Nashville had a splendid building record the past two months. Permits were issued during October for improvements to cost \$82,569.40, compared with \$73,469.75 for the same month last year. During September permits amounted to an increase of over 50 per cent over last year. This is a remarkable record considering the general business conditions brought about by war. This immediate territory is perhaps about as small a sufferer because of the war as any section of the country. Only a small amount of cotton is produced in middle Tennessee, and but for the uneasiness caused by the war there would be little to cause any depression here.

The Hermitage Spoke Company with authorized capital stock of \$30,000, has been incorporated, with headquarters in Nashville. I. F. McLean, A. B. McCarthy, Lewis D. Johnson, W. B. Leech and Henry C. Leech are incorporators.

The Nashville Lumbermen's Club has withdrawn the complaint against the Louisville & Nashville as to local rates in Tennessee. The case against the Tennessee Central Railroad will be prosecuted on account of the discrimination as to grades of lumber amounting to about 2 cents per 100 pounds. It is insisted that this differential is unjust, and that there are many difficulties in the way of fair enforcement of the same.

← LOUISVILLE →

H. A. McCowen, president of the Ohio River Sawmill Company of Louisville has moved his home to this city from Salem, Ind., where he is president of H. A. McCowen & Co. Mr. McCowen has taken a home on beautiful Eastern Parkway, overlooking Cherokee Park, and is likely to be seen following the little white ball around the Cherokee golf course. Mr. McCowen is one of the leading walnut men of the country, and reports a brisk demand for this wood, both from the furniture and the interior finish trade. He also believes that there will be some big business in thick stock on account of the requirements in Europe for walnut for gunstock purposes.

C. W. Johnson, trustee in bankruptcy for the Consumers' Lumber Company of Louisville, which was recently petitioned into bankruptcy by the Norman Lumber Company and the Edward L. Davis Lumber Company, is winding up the affairs of the concern. The office furniture was sold at auction last week.

The H. E. Heimberger Lumber & Veneer Company of New Albany, Ind., is arranging a compromise with its creditors on a basis of twenty-five per cent. It is understood that this will be accepted by the claimants, most of the leading creditors having already agreed to it. Adam Heimberger, father of Harry Heimberger, who runs the business, died a few months ago.

Edward Duckwall of the Indiana Veneer & Panel Company of New Albany, Ind., died at his home at Salem, Ind., November 2 at the age of forty-six. His death was due to nervous prostration, and followed an illness of several weeks. In addition to being prominent in the panel business, he was also a well-known furniture manufacturer, being an officer of the Stout Furniture Company and the Stout-Mehorney-Duckwall Company, both of Salem. The latter company makes the cases for one of the leading talking machine companies, and was one of the first to introduce American walout in recent years. Mr. Duckwall was well known to lumbermen throughout this part of the country. He is survived by his wife and three children.

State Forester J. E. Barton will open a second tree nursery at Frankfort, the state capital, this fall. He is preparing twelve seedbeds, 4x24 feet in dimensions, on the farm of the Kentucky Normal and Industrial Institution. Walnut, hickory and several varieties of oaks will be planted. The nursery will have an initial capacity of 100,000. Albert Martin has been put in charge of the Frankfort nursery. The Louisville nursery is to be enlarged this fall, and it is expected that next spring 1,000 young trees, particularly black locust, will be ready for distribution from that plant.

The state forestry department is also busy in connection with its protection work, and is extending the service to western Kentucky, as well as the mountain section in the eastern part of the state, which is the more heavily timbered. Wardens are on the lookout, and local associations are doing good work both in fighting fires and maintaining patrols of the forests. Sentiment against careless exposure of woodland to the danger of fires is also being created. The first forest fire of the season occurred on the Harris branch of the Clover fork of the Cumberland river, in Harlan county. It was put out after burning over about fifty acres of timber.

Bronston S. Kenney of the well-known family of Frankfort, Ky., which has long been prominent in the lumber manufacturing business, was recently married at Shelbyville, Ky., to Miss Mary McCormack. The couple left for Asheville, N. C., on their wedding journey, and will live in Frankfort.

A number of lumber manufacturers who have not closed their mills completely are authority for the statement that they are operating at less than half capacity. Considering this fact in connection with the large number of plants that are absolutely down, it is evident that production has been greatly reduced, and that the market is technically much stronger than it has been. A slight reduction in the present available stocks will mean that many items will become scarce, and that prices will have to be advanced accordingly.

The Salt Lick, Ky., Lumber Company has been incorporated with a capital stock of \$100,000. Those signing the articles are E. H. Swindell, W. H. Jacob and T. B. Stagg.

A recent boiler explosion near Morehead, Ky., which destroyed the mill of M. T. Dillon, caused the death of several men, including Everett Patton and John Sublett, while Mr. Dillon himself is in a dangerous condition. A bill will be introduced in the next Kentucky legislature, the correspondent of HARDWOOD RECORD is informed, requiring the inspection of all power plants and the licensing, after examination, of engineers. It is believed that this will prevent many of the explosions, usually accompanied with fatalities, such as have been happening frequently in this state, and particularly at small country mills.

◀ ARKANSAS ▶

The Little Rock Lumber and Manufacturing Company of Little Rock, Ark., which was recently incorporated under the laws of the state of Michigan, with a capital stock of \$100,000, is erecting a new band mill in the Factoria Addition to Little Rock, which will have a daily capacity of 45,000 feet. The company expects to have the mill in operation by December 1. This company will specialize in plain and quarter-sawed oak. It has temporary offices in the Southern Trust building, Little Rock, in charge of D. S. Watrous, secretary-treasurer and general manager of the company. J. L. Retting of Grand Rapids, Mich., is president of the corporation.

The Arkansas Veneer Company of Helena recently filed notice with the secretary of state of Arkansas stating that it had increased its capital stock from \$40,000 to \$75,000. A. C. Beck is president of the company and W. E. Cannon is vice-president.

The Fullerton-Powell Hardwood Lumber Company of Missouri has filed copy of its charter with the secretary of state of Arkansas and been granted permission to do business in this state. R. E. Farrell of Little Rock is named as its state agent.

T. M. Barton will manage the new stove mill which is being erected at Perry, Ark., by the Thoits-Barton Company. Mr. Barton expects to have the mill completed and ready to run within a few days. The mill will employ thirty men, and will have a daily capacity of 5,000 barrels. It will run nine hours per day, and will have a weekly pay roll of \$800.00.

The A. H. Andrews Co.
115-117 S. Wabash Avenue
CHICAGO, ILLINOIS

manager for the Chess & Wymond Stave Company of Louisville, Ky. Mountain View will be the headquarters for the company in Arkansas. The Chess & Wymond company owns about 50,000,000 feet of white oak timber in Arkansas, located principally in the northwestern part of the state. The company owns and operates eight mills and a finishing plant in Arkansas. Five of the mills are located in the Ozark mountains, in Stone, Baxter and Searcy counties. Three of the mills are located in the Boston mountains in Newton county. The finishing plant is located at Kensett, Ark., about fifty miles north of Little Rock on the Iron Mountain railroad. The company is preparing to double the capacity of the finishing plant, with a view to finishing up the staves before shipping them to Louisville.

H. G. Hergott, secretary, and W. R. Foley, general manager, of the Pekin Coopersage Company of Pekin, Ill., have recently visited the company's plants in Arkansas and made examinations into the company's holdings and affairs. The company owns and controls a vast amount of hardwood timber in the state, and has a large number of stave-mills and coopersage plants. Under the existing conditions, Mr. Hergott and Mr. Foley appeared fairly well pleased with the company's affairs in Arkansas.

R. C. Huey, who for the past several years has served as assistant supervisor of the Ozark National Forest in this state, has been transferred to the Arkansas National Forest, also in this state, where he will hold a similar position. Mr. Huey has been employed in the Ozark forest since it was set apart by Congress in 1908.

The business men of Shirley, Ark., have organized themselves into a Business Men's Club which will have as one of its chief objects the getting of hardwood plants to locate at that place by offering special inducements to the owners.

WISCONSIN

The Heineman Lumber Company of Merrill has completed the survey for about five miles of logging road in Lincoln county, which will tap a portion of the twenty-year run of timber which the company holds. Announcement has been made that the Heineman mill will operate full blast this season.

The Crocker Chair Company of Sheboygan has announced that it will make its normal cut of logs this winter. The company now has a large crew of men at work on its timber near Elton in Langlade county.

Harry E. Siewright, formerly of Stevens Point, has organized the Siewright Lumber Company in that city with headquarters at 1102 Ellis street. Hardwood, hemlock, pine and a general line of lumber products will be handled.

Much of the valuable timber near Cranston, owned by the Holt Lumber Company and the Oconto Company will be opened up by the building of the Kingston-Cranston line by the Chicago & Northwestern. The company has awarded a contract to the Cleary, White & Duffy Company for laying the line and work will start at once. It is expected that five miles will be laid this fall. The timber to be made more accessible will be sawed at Oconto.

The Albrecht Company of Kewaunee is erecting a large storage shed and warehouse near its planing mill. The structure will be 50x100 feet in dimensions.

The plant of the Glidden Manufacturing Company at Glidden was completely destroyed by fire recently. The loss is estimated at \$30,000, partly covered by insurance of \$15,000. It is not known whether or not the plant will be rebuilt.

Mrs. Valeria Adams Knapp, widow of John H. Knapp, one of the founders of Knapp, Stout & Company, one of the pioneer lumber concerns of Menomonie, Wis., died on October 25 at the age of eighty-four years.

Hon. George C. Jones, pioneer lumber land and mine owner with properties in Wisconsin, Michigan and Oregon, dropped dead at his home in Appleton on October 22 at the age of eighty-five years.

Superintendent Nicholson and a crew of about fifty men are estimating the timber on the Menominee Indian reservation at Shawano. It is expected that the work will require about six months' time. The government some time ago set aside \$10,000 for the work.

The city authorities at Marshfield are endeavoring to secure the location of the proposed new plant of the Rib Lake Lumber Company, whose mill at Rib Lake was destroyed by fire several months ago. It is understood that the old Upham sawmill at Marshfield would be utilized.

The F. W. Buswell Lumber Company of Wausau is preparing to dissolve, and the business is now being liquidated by F. W. Buswell who is about to retire. Mr. Buswell has been engaged in the lumber business for thirty-three years, thirteen of which he served as president of the Buswell concern.

The Merchants' & Manufacturers' Association of Milwaukee has received copies of the orders from Greece for more than 40,000 cubic feet of fir logs that have been forwarded through the American consul at Athens and distributed by the Department of Commerce at Washington. Elm staves for raisin and currant barrels, for which there is a great demand throughout southeastern Europe, also are sought in Wisconsin.

During the twenty-eight months of experience up to January 1, 1914, under the Wisconsin workmen's compensation law, a total of \$396,354.73 has been paid to working men of Wisconsin or their dependents. This sum represents the amount paid in 6,894 cases, most of which were settled amicably between employers and employes without the aid

of lawyers. The lumber interests of Wisconsin have to a large extent gone in under the compensation law.

A. E. Solie, Wausau, manager of the Central Wisconsin Traffic Bureau, is preparing a formal protest against the advance in rates on lumber shipments, recently put into effect by several of the railroads. The increased tariff applies from all Wisconsin and Minnesota points to points in Indiana, Ohio, New York, Michigan, Pennsylvania and West Virginia and is scheduled to take effect on November 16.

< DETROIT >

Fire destroyed a two-story building in one of the yards of the Grand Rapids Lumber Company at Grand Rapids, causing a loss of \$12,000. Piled in the warehouse were 200 bundles of shingles and about 10,000 feet of lumber. The loss is covered by insurance.

The Loud Lumber Company at Charles reports business good toward the close of navigation. In addition to hemlock the company is shipping beech and maple. The steamer M. Sicken recently delivered a full cargo of beech and maple at Detroit. The Loud Company has received two miles of rails which will be used in immediate extension of its logging branch into new tracts of timber.

C. A. Grinnell of Grinnell Bros, operating piano factories at Detroit and Holly, Mich., and at Windsor, Ont., in discussing business says, "Conditions are shaping up so that we will be forced into the wholesale field whether we want to go or not. The demand for our products will not allow us to abandon our Detroit plant as we anticipated after starting the factory at Holly. We will have to enlarge the factory at Holly."

It is announced that the sawmill of the Eddy Lumber Company at Lake Linden will suspend operations about November 15. Two large logging camps have been opened.

The Wilmot Chair & Seating Company is the name of a new industry started at Detroit by John F. and William H. Wilmot.

The John D. Raab Chair Company's plant at Grand Rapids has resumed operation on a 10-hour-a-day basis and is now operating with a full force of employees. Officials of the company announce that there are orders on hand to warrant such operation.

Fayette S. Cable, president of the Cable-Nelson Piano Company, personally denies a report, given much publicity, to the effect that the company's plant at South Haven will suspend operations. The company will curtail temporarily but only in the departments making cases. The move is necessary to allow other departments to catch up on the work. Mr. Cable further says that orders are coming in well, considering general conditions. The usual dropping off of business at the holiday season is expected, but the present outlook does not forecast any marked slackening of operations as compared with the same season in previous years.

A jury in the United States district court at Bay City held the Saginaw Wood Products Company of Gaylord, Mich., solvent in answer to petitions of creditors that the firm be declared bankrupt. Investigations by a receiver appointed by the court disclosed the fact that the company is behind on orders and has a good business in the manufacture of hardwood specialties. The company's assets are about \$125,000 and liabilities are comparatively small. Momentary inability to realize on collections was responsible for the company's embarrassment. A receiver has been appointed to conduct the affairs of the company until creditors are paid. The firm employs about 125 men and is operating its plant steadily.

The E. H. Stafford Manufacturing Company's mill at Sand Bay, near Cheboygan, which has been idle for several months, will resume operations.

The Auto Body Company is erecting a mammoth addition to its plant at Lansing. Woodworking machinery will be installed as soon as it is completed. The company has had a remarkable growth since its formation a little over a decade ago and has several times enlarged its plant. It is now one of the big industries at Lansing.

The D. A. Stratton Company's handle factory at Atlantic Mine, Mich., is operating at capacity and does not seem to be affected by adverse conditions. The company has men in the woods and is shipping regularly from its factory.

The manufacture of chairs will be started in a small way by the newly formed Vanderbilt Chair Company, at Vanderbilt. Practical chair men are interested in the venture.

The North American Construction Company of Bay City has closed a deal with the British government for 600 ready-cut houses to be 20x60 feet to be used in housing Belgium refugees. The order will take about 7,000,000 feet of lumber and is a rush job. In addition to other plants throughout the country the company is preparing one at Bay City. Much lumber is being bought in northern Michigan, several cargoes having already arrived at Bay City for the company.

The Michigan Truck & Lumber Company at Holly reports business good. The company's plant is operating overtime, to keep up with a contract with a Detroit automobile company.

In the present season extensive additions and improvements have been made at the various Grand Rapids furniture factories that do not indicate a pessimistic view of the future. The Wilmarth Show Case Company has doubled the capacity of its plant, while the Grand Rapids Chair Company, the John D. Raab Chair Company and the Silgh Furniture Company have made extensive additions to their plants. Previous to improvements made this year, the Grand Rapids Refrigerator Company

THE GLUE THAT IS APPLIED COLD

In Flush Veneered Doors

The chief consideration is uniformly high-grade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Use

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing—for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

Tacoma, Washington, U. S. A., Sept. 29, 1913.
File B.

Perkins Glue Company,
South Bend, Indiana.

Gentlemen: The convenience and economy of the use of Perkins vegetable glue, its uniformity and the satisfactory results we have obtained, together with the courtesy we have been uniformly shown by the officers and representatives of the company, prompt us to express in this way our appreciation of the Perkins Glue Company and its products.

Yours very truly,

THE WHEELER, OSGOOD COMPANY,
EHC:S R. H. Clarke, Treasurer.

Perkins Glue Company

Originators and Patentees

805 J. M. S. Building, South Bend, Indiana

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

enjoyed the distinction of having the largest plant of its kind in the world. The plant of the Powers & Walker Casket Company was practically doubled.

The Hardwood Market

< CHICAGO >

A slight tendency toward favorable development has been seen in Chicago during the last couple of weeks, although there is really nothing that can give definite assurance of real activity in the opening up of business in the near future. There seems to be, however, a pretty general feeling that following the first of the year the situation will show a slightly better tendency. Of course, any predictions of this kind are only predictions and can not be established with any assurance of their authenticity.

The building situation continues on a fairly satisfactory basis while the yard and factory trades are doing about as great a volume of business as could be expected. Chicago, of course, in common with other cities of great importance as consuming centers, is taking in a lot of stock which is unloaded here when other markets are not easily accessible. As a consequence, price levels are extremely uncertain. However, the general average is fair considering present conditions of business and the uncertainty as to the future.

< NEW YORK >

The local hardwood market is still a long way from normal although some slight improvement is reported in spots. One wholesaler is freely predicting a turn for the better at an early date and a steady upward tendency next year. In the face of present conditions there is not much in support of such a prediction but it can well be said that any change will be for good. It is reported that manufacturing trade is taking a fair amount of stock now and that some yards are even taking advantage of the low prices and buying for stocking up purposes. Generally speaking, though, yard stocks continue broken and quick supplies available for all demands. The wholesale market shows some slight reductions in ash and chestnut, with a fair call for both. Exports from New York show a steady increase in which lumber so far has shown up only in a small way. And quite naturally, too, but a betterment in this branch of trade may be looked for within a short time and with it a consequent steadying in the home markets. The large quantities of hardwoods reported sent abroad should have a tendency to strengthen the market in face of reported curtailment of output.

< BUFFALO >

The hardwood trade is about as dull as it has been in a long time and so far no particular evidence of improvement is in sight. Occasionally dealers who have some stock that is specially wanted are able to move it quickly, but for the most part there is not much doing at the different yards. It is scarcely believed that any great change for the better will occur until after the next year starts and by that time it would seem to dealers that stocks will be considerably depleted.

Plain oak is perhaps as much in demand at all the yards as anything else, but the total sales recorded are not such as to count for much. Prices are off several dollars from the first of the year and some dealers think the quotations may drop a trifle lower before an advance occurs. Chestnut and poplar are among the quiet woods and very little is doing in maple, though it stays among the leaders.

< PITTSBURGH >

Things are looking up a little in this district, although the improvement is still very slight. The market is extremely irregular. Demand cannot be counted upon. The only thing that is certain is that manufacturers who use large quantities of hardwood are not putting out any requisitions for next year's supply. Instead they are buying only for immediate needs and in small quantities. Mixed carload lots are decidedly the rule in present day trade. Automobile manufacturers have not come into the market to any extent. Some more business is being done with the implement and vehicle people, but this trade is away below normal. Yard business for the year is nearly ended. Prices on all hardwoods are being cut badly to unload the surplus stocks which are gradually accumulating at mills in this territory.

< PHILADELPHIA >

The hardwood market remains undependable as to a featured improvement, but the trade is accepting this natural sequence of the foreign upheaval as heroically as possible. Fortunately cool heads are everywhere in the front of all large trade bodies in the United States, seeking means and methods to open new fields to relieve the situation, and confidence in the ultimate desirable result to the American market is unbounded, which explains the general optimistic trend in all lines of trade. Wholesale consumers, box and barrel factories, in fact all buyers

of hardwoods, are retrenching to some extent, and the economic methods pursued have helped to keep down the list of failures and litigations in the lumber trade. Buying continues conservative, occasional spurts in certain lines are noticeable, but it is admitted they simply cover some special order. Although there has been a curtailment of output in mill districts, hardwood lumber is freely offered at tempting prices, with very little encouragement from the buyer, who will not be bribed to stock up.

As to quotations, there is nothing reliable to guide the trade at this time. Oak, which continues in the lead, has been shaded some. Maple, birch and beech keep fair reputation. Flooring has been active and fairly strong. Chestnut and poplar are slow; low grades generally have held a firm position.

— < BOSTON > —

The situation in this market shows but little change if any, although what evidences there may be observed are toward an increased inquiry and some failure to find stock available for orders. The depression and restriction more sharply felt during the period of business contraction has now given way to a methodical cultivation of buying opportunities or "bargain hunt" for stock to fill what orders are secured. That there are numerous hardwood items which are bought and sold here on a decreased price must be admitted and with this generally understood condition, buying is still reduced to a necessity basis. At the same time continued moderate activity in manufacturing keeps up a corresponding demand, but with a well defined expectation of cut prices. With no good reason to anticipate an immediate increase of trade the commonly stated position of the dealers here is that the hardwood business must adjust itself to circumstances and await the improvement of general business.

— < BALTIMORE > —

While in a general way the hardwood trade situation remains much the same, the preponderance of opinion appears to be that some improvement has taken place. Leading members of the trade seem to have reached the conclusion that bottom has been touched and that the movement now is upward, even though no decided progress has been scored so far. Orders come in by spurts. It does not appear that the quotations have gone lower, but more or less fluctuation in the prices realized prevails, and there is no very settled basis for the sellers to go on. A millman may feel that he has gone as low as he can, only to find that a competitor has made further concessions. But it must be understood that the marking down of figures does not necessarily bring business. The prospective buyer who is solicited for an order will not place it if he can get along without any addition to his stocks. At this time, as much as any other, the speculative business remains in abeyance, the buyers taking up stocks only to meet their immediate wants. This applies to practically all woods in general use. The better feeling with respect to poplar, noted some time ago, remains in evidence, being based mainly on the larger shipments to foreign countries, which have developed greater wants than seemed at first likely. Stocks in England, for instance, were relatively small when the war broke out, and after the first shock the buyers there set about adding to their assortments because they felt the lumber would be called for. It is much the same with oak, of which wood a number of foreign shipments have been made of late. Not only are the ordinary wants asserting themselves, but the prosecution of the war brings out requirements which must be met, and it is being found that the selection is smaller than existing conditions render desirable. The foreign buyers have made some advances over and above the increase in the freight rates, and the outlook for a still further gain in the foreign movement is decidedly promising. This, of course, is having a favorable effect upon the situation at home, and most of the mills continue in operation. Of course, a number of the plants which sawed lumber especially suitable for the foreign trade have held down of late, but relatively the prospect is encouraging. The furniture factories and makers of store fixtures are still buying with some freedom, and the increasing use of hardwoods for purposes which were formerly met by other kinds of lumber furnishes an enlarged outlet. Much is hoped from the improved financial conditions and the easier tone in the money market, and the hardwood men are prepared to take advantage of any change for the better that manifests itself.

— < COLUMBUS > —

There is a fairly good volume in the hardwood trade in Columbus and central Ohio. The volume of business, however, is not up to that of 1913 for the same period, but considering the European war and general business conditions the trade is satisfactory. Prices are fairly well maintained although there is some cutting in quarters where stocks have accumulated. The tone of the market is fair and future prospects are not considered bad.

One of the best features is the better buying done by certain lines of manufacturing. Factories making furniture and vehicles are buying more liberally. Implement concerns are not buying to any extent as the export trade has been stopped. Stocks in the hands of factories are low and purchasing agents are only buying what they need for the present.

Retailers are experiencing a better demand, since building operations are more active. For a time there was a lull in building due to the

SEATTLE, WASH., 1009 White Building

tightness of money, but banks and building and loan associations are loaning money more readily. This is being reflected upon the lumber trade by a better demand from retailers. In the rural sections there is considerable building in progress.

Dry stocks are not very large in any section. Retailers' stocks are light but dealers are still following the policy of buying only for the immediate present. Shipments are coming out promptly. There is practically no export trade at this time. Collections are slow.

Quartered and plain oak is in fair demand and prices are generally maintained. Chestnut is rather firm and sound wormy is moving well. Poplar stocks are in fair demand and the better grades are firmer. Ash and basswood are steady. Other hardwoods are unchanged.

◀ TOLEDO ▶

Market conditions in Toledo are showing a decided improvement. While present business has not become phenomenal by any means, indications point to a better situation at an early date. Building operations in Toledo continue in spite of the calamity criers, and many things are now under way which will make a good hardwood market within a short time. Local vehicle concerns are running right along. Furniture dealers are ordering with more freedom than for some time past, and inquiries are beginning to come in from the railroads regarding equipment orders. This has been the line of work that has been most quiet and has had an especially depressing effect on hardwood business in this section so that the coming of the inquiries presaging as it does future orders has had the effect of rousing the dormant spirit of optimism among hardwood dealers here. Prices generally have been holding up well, although there has been a little weakness exhibited in certain lines where the law of supply and demand has regulated prices to a no inconsiderable extent. Crating and boxing are in fair demand. Buying is somewhat better, although no one is doing speculative buying.

◀ CINCINNATI ▶

A slight improvement in the hardwood industry is noticed and lumbermen are much encouraged. Reports from manufacturing centers give much hope of early increase in running time. It is claimed that the much improved condition of the finances of this country together with the employment of many of the idle workmen will go a long way toward better business. The agricultural and wagon trade is no doubt in better shape than they have been for many months and the automobile plants, especially those specializing in commercial trucks, have plenty of work on hand many of their orders being for rush shipment on war orders. It is fully expected that these orders will be more than duplicated as there is no question of the war lasting well into next year. Horrible as the war may seem it is proving to be of much benefit to this country commercially, as it has already prevented foreign manufacturers from flooding our markets with their manufactured goods. Since the new tariff laws went into effect they have had an opportunity to do it and have shipped much here and booked heavy orders which the war has caused them to cancel and our own plants are again getting started toward supplying our own needs as well as the needs of the foreign countries at war. Cincinnati lumbermen are well pleased over results of the elections insuring in the near future a return to a protective tariff which will again establish the plants of this country in their former positions. Just at this time there is nothing featuring in hardwood movements—just a general call for most all items on the list in very limited quantities for immediate use only with frequent re-orders for practically the same thing, showing the cautiousness of buyers. The volume of business for the month of October was considerable in excess of the previous month and with conditions growing gradually better as they surely are November should show up well under existing conditions. Inquiries are more numerous and cover most items.

◀ INDIANAPOLIS ▶

There has been some further curtailment in the hardwood production in the state during the last two weeks. The general trend is toward production curtailment, with a view to reducing the large stocks which many of the mills now have on hand.

Stock continues to move slowly and dealers are buying very little at the present time. There is an indication, however, that business in other lines slowly is improving and this renewed activity will reach the hardwood industry in due time.

Wagon manufacturers report a good increase in business, due to a large extent to the European war, for the countries engaged in the conflict are placing large orders for wagons. Automobile concerns manufacturing trucks report improved business from the same source.

There can be no improvement in building operations in the state, until the vast sums of money hoarded in the banks are made available for building purposes.

◀ MEMPHIS ▶

There has been comparatively little change in manufacturing operations in this territory during the past fortnight. While some mills have resumed, fully an equal number have closed down and it is conceded that production is at about as low an ebb as it has been at any time since

war broke out in Europe. There is a little logging under way but those who are getting out timber are doing so in such a sparing way that, if they find it necessary or desirable to close down, they will not be forced to run to cut up excess logs as was the case when hostilities first developed. The amount of timber being gotten out is, as a whole, exceedingly light and this is regarded as one of the strongest potential features in the situation. Even if it were desirable to run on anything like normal time, this would be out of the question for the reason that it would be impossible to secure enough logs to justify such operations.

Shipments of lumber are somewhat in excess of output with the result that stocks are gradually decreasing. They are becoming broken in some items and this fact is responsible for the resumption on the part of a few firms. Demand, at best, is not particularly full, and there is not a single lumberman who does not wish to have his stock lists complete in order that, if there is demand for a particular kind of lumber, he may be in position to take care of it. The fact that stocks are being reduced is having some effect on prices, which are generally rather firmer. Wholesalers and distributors are making freer inquiries than a short time ago and it is pointed out that this is a favorable factor, suggesting larger requirements for the near future. Business conditions are generally growing better and the financial outlook is regarded as much brighter, factors which are calculated to increase the consumption of southern hardwoods. At present the increased firmness is more due to the greater independence of sellers than to the gain in demand. As demand increases, however, it is anticipated that it will prove the controlling factor in making prices.

A great quantity of ash has been hooked here within the past fortnight for shipment to England. The orders for this stock were received from English brokers who, it is understood, were acting for the English government. It has been impossible to ascertain the exact amount sold but it is reported that it was sufficiently large to take up the greater portion of the available supply of thick ash in the immediate Memphis territory. A number of firms here shared in these orders. Among these were Russe & Burgess, Inc., the Goodlander-Robertson Company, Jas. E. Stark & Co., the Dudley Lumber Company, and the Gayoso Lumber Company. It is reported that prices advanced somewhat on ash as a result of this somewhat unexpected business and that they are at present quite firm. Practically all the orders specified that shipments were to be made in time for November sailings. This was one of the particular conditions of the acceptance of this business.

Export business, as a whole, has improved somewhat, but outside of the business in ash already mentioned, it has been comparatively small. Most of the business is being done with England, though shipments are being made in a very few instances to other countries. Exporters say that there is not a very large margin of profit in lumber being sold to England, but that they are accepting such business as is offered where it is possible to do better than break even.

Most members of the trade here are rather optimistic regarding the outlook and there is less pessimism than might be expected under the circumstances. Lumber interests have pursued a very conservative policy since the war broke out and this accounts for the fact that they are in as good position as at present. They point out that demand has been only reasonably good, but that production has been even smaller than shipments. They further emphasize the fact that, with general business increasing, they are bound to feel the effect of this in larger and more remunerative orders.

There is no special feature to the hardwood list aside from the recent activity in ash and the excellent demand for the lower grades of cottonwood and gum, which are being used freely in the manufacture of boxes. Quartered oak is selling at a reasonable rate and there is a little business doing in plain oak. Sap gum is selling well and offerings are not heavy. Red gum appears rather quiet. Cypress is moving in only a moderate way, with the lower grades somewhat more active than the higher.

← NASHVILLE →

The hardwood lumber situation in Nashville has shown very little change the past two weeks. The situation was regarded about as slow as it could get shortly after the opening of hostilities in Europe, but members of the trade now feel confident that improvement will be a feature for the future. Some nice lots of lumber are being sold, though buyers are only taking for current needs. No particular lines are in demand, there being transactions in oak, poplar, chestnut, ash, and other lines. The policy of curtailment is evident throughout this section, many of the small mills being closed down, and the large ones curtailing production. There will be a great curtailment in logging operations on account of the condition in the market.

← LOUISVILLE →

The hardwood trade in this part of the country is looking up. The actual bookings are better, inquiries and orders having been more numerous than formerly, and while the size of the average order is small, the aggregate amount of business is increasing right along. Some large consumers are buying a good deal of stock, a local hardwood concern having been offered an order for 200,000 feet of firsts and seconds plain oak, which was turned down on account of the price being too low. Inch plain oak has suffered considerably as to price, but all other thicknesses are holding their own, and seem likely to increase in value, inasmuch as the cessation of active operations, followed by steady consumption, is

bound to bring about a shortage of these items. Lumbermen with stock other than inch, therefore, feel that there is no need to sacrifice the price, but that they will be able to get what it is worth by holding it a few months. It is not easy to duplicate such stocks at present. Quartered oak is in good demand, especially firsts and seconds, and on certain specifications prices have shown strength. Some sales up to \$80 have been reported. The demand for lumber abroad, for use in military operations, is opening up. The English government has had an inquiry out for several weeks for thick walnut for use in the manufacture of gunstocks.

< ST. LOUIS >

There is very little new to report in regard to the hardwood situation. Trade is very quiet. Orders are coming in all the time but they are for small lots. The best item in demand at the present time is plain sawed white oak. There is also a fair demand for red gum and wide poplar boards. Ash is moving only moderately well but better than it did and this has caused a stiffening in prices. A dullness is reported in the cottonwood demand for lower grade but the cottonwood upper grades are slightly more active than they were a short time ago. The cypress situation is also quiet with a fair demand only from the North. This section is doing some buying. In other sections, the demand is not showing up as it should. Prices are fairly firm. It is the general opinion that conditions will be better soon, as the election is over and things will quiet down.

< MILWAUKEE >

While lumbermen are about reconciled to the fact that the fall trade will not be quite up to the normal this season, they believe that the total business received will be fairly satisfactory and as great as could be expected, considering general conditions. Large orders are not so plentiful, but the total volume of small orders is fairly large.

A change of sentiment regarding the influence of the European war upon the lumber trade seems to be gradually taking place among the lumber manufacturers of northern Wisconsin. The feeling seems to be that unusual efforts are being put forth to push the export trade in various lines and into new fields, heretofore unexplored. This seems to be borne out by the fact that the export trade has actually shown some improvement of late. Some lumbermen are predicting that this increase of the export trade in new fields will eventually bring lumber into good demand and at satisfactory prices.

Prices have been holding up fairly well, due to the fact that most lumber concerns in the state have been operating in a conservative manner and have been endeavoring to prevent stocks from piling up. The belief that the export situation will eventually adjust itself in a satisfactory manner has also been a strong factor. Of course there is some price cutting going on in some lines, particularly in the larger cities where competition for business is strong, but prices are far from being demoralized. Most manufacturers are refusing to put their prices below a normal level.

The sash and door and general interior woodworking manufacturing concerns of Milwaukee are buying rather carefully and are placing orders only for sufficient stock to meet their present wants. Wholesalers say that stocks are low in the hands of consuming concerns as well as with the retail yards about the state and that if the general business situation continues to improve there ought to be a brisk demand for lumber soon after the opening of the new year. This view seems to be general and has done much to help establish a feeling of optimism in the local trade.

Northern woods are holding their own, due to the action of manufacturers in keeping down the output to a reasonable amount, and to the feeling of certainty that demand is bound to increase within the near future. Maple and birch seem to be especially strong.

The building investment in Milwaukee during the month of October showed a decided falling off, although there was an increase in the number of permits issued. This decrease in the cost of buildings erected seems to have been due to the fact that permits were granted a year ago for several unusually large structures. Last month there were 282 permits issued for structures costing \$611,577, as compared with 251 permits and an investment of \$1,213,695 during the corresponding month a year ago.

< DETROIT >

Members of the Detroit Hardwood Club are in entire accord with the curtailment of production planned by the Michigan hardwood manufacturers. The more proportionate the supply and demand are the better satisfied Detroit dealers will be. Market conditions have forced down the market, which was a natural course. Detroit dealers are willing with the rest of the country to bear the burden but they are anxious that whatever demand there is be supplied at a reasonable price.

Trade in all lines continues spotty. Curtailment in manufacturing is not becoming more severe and conditions are not clear enough to predict a turn for the better, as is evidenced by the short order plan of buying.

Building operations are not so strong as they have been and this month and December will have to make a good showing to insure a favorable comparison with last year. The bulk of the present construction is in factory buildings and cheap houses.

YOU SHOULD USE THE GIBSON TALLY BOOK

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—4½x8½ inches in size.

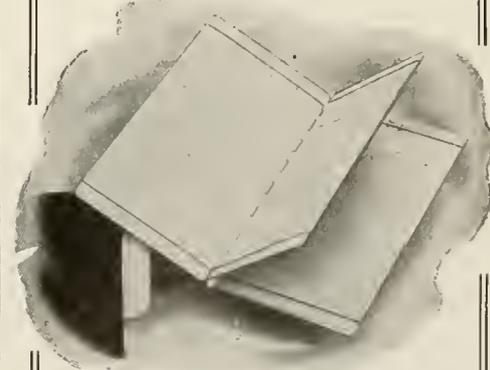

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket.

Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired. Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs. Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability, convenience, accuracy, and for systematizing the inspection and measurement of lumber.

Patent applied for on covers. Copyrighted, 1910. Triplicate Tally Tickets patented.

PRICE LIST

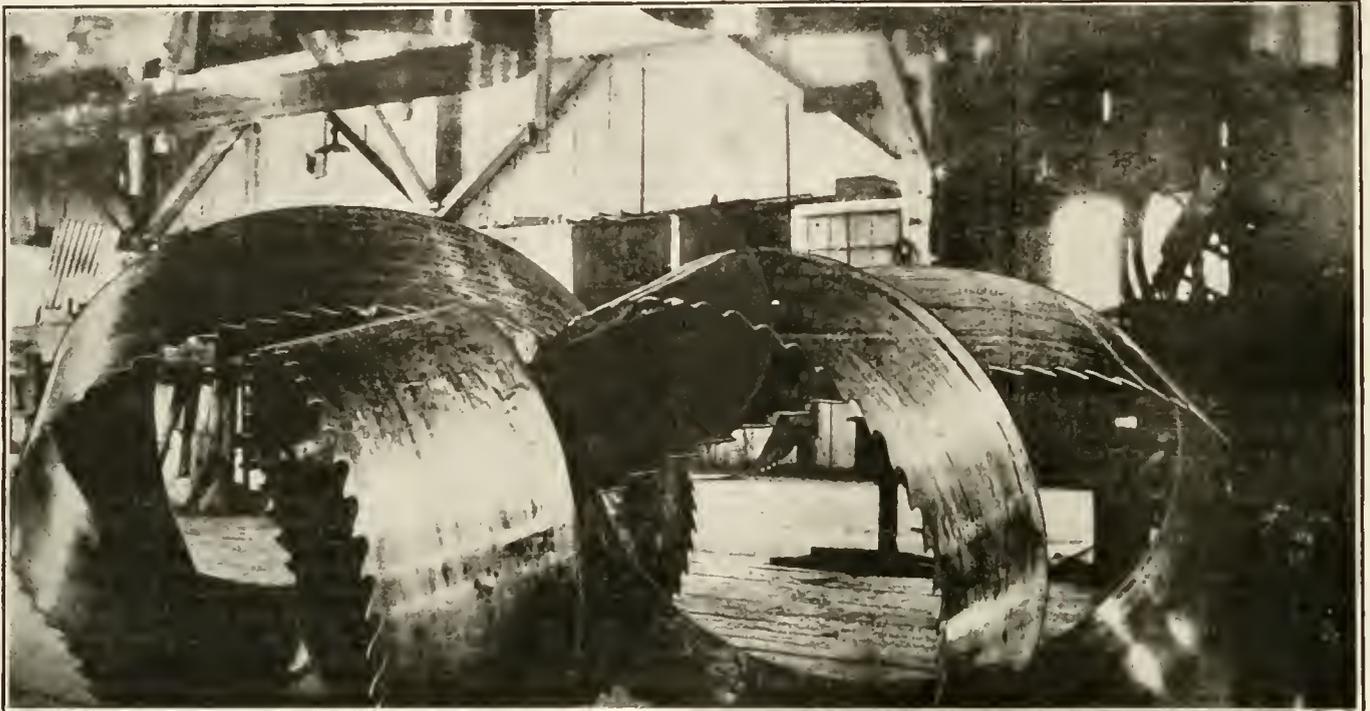

Aluminum Tally Covers, each	\$ 1.00
Aluminum Tally Covers, per dozen	10.00
Patented triplicate Tally Tickets (stock form) per 1,000	10.00
Single sheet manila (stock form) Tally Tickets, per 1,000	4.00

Specimen forms of Tally Tickets mailed on application. Covers sold on approval to responsible concerns.

Manufactured by

Hardwood Record
537 S. Dearborn St., CHICAGO

No, This Is Not a Picture of a Russian Subma-
rine, a French Air Ship or a German Man-of-War

It is an actual photograph of an

ATKINS SILVER STEEL BAND SAW

that was accidentally pulled off the wheels and tied itself into the above double bow knot in such a way that it had to be cut, in order to be straightened out. Vic. Tuxworth, the filer, rebrazed and benched the Saw and it is now running each turn without a single crack.

Now, really, Mr. Mill Man, don't you want Saws like these in your mill?

If we can furnish you with Saws that will stand up longer with the least re-fitting, then you would be satisfied that you were making the most money on Saws. Saws like those are an investment and not an expense.

Atkins Always Ahead!

We make a Perfect Saw for Every Purpose. Use ATKINS CELEBRATED SILVER STEEL BAND SAWS, ATKINS SILVER STEEL CIRCULAR SAWS, GANG SAWS, EDGER SAWS, CROSS CUT SAWS, ATKINS MACHINE KNIVES.

EXPERIENCED LOGGERS USE YELLOW STRAND POWERSTEEL

In every hardwood lumber district in the United States—wherever ropes of extra strength and durability are required—there you will find Yellow Strand Powersteel Wire Rope.

It is made especially to withstand the tremendous strains of logging and heavy hoisting of all kinds.

Every wire is drawn from a special steel having a tensile strength 75 to 100 per cent greater than ordinary crucible steel. This insures great strength, elasticity and long life to the rope.

You need this strong, tough, pliable rope in your business. Why not place the order now?

Write for catalog No. 50

EASY TO INSTALL

CHICAGO, July 13, 1914.

The National Dry Kiln Co.,
Indianapolis, Ind.

Gentlemen:

We are very glad to advise you that our kiln, which is installed with VERTICAL PIPING system furnished by you, has now been in operation about six months and results are all that we could desire. We wish to state that this material was received in condition which enabled us to install it from the blue print without any difficulty on our part.

We will be very glad to have you use our company as a reference at any time.

Very truly yours,
ROSELAND MILL & LUMBER CO.,
By R. J. Dickerson.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

ABC AND WESTERN UNION CODES

St. Francis Basin Oak

☐ Kiln dries without checking. No honey-combing, and minimum shrinkage. Growing beyond the over-flowed district, it matures slowly—hence has even texture and is soft and light with uniform color.

☐ Total absence of injurious insects insures sturdy, clean growth.

☐ Our band mills cut oak only—hence filer and sawyer get best possible results.

 White Oak always in stock

MICHIGAN

FAMOUS FOR HARD MAPLE AND GREY ELM

CADILLAC GRAY ELM

was used for finish in the living room of the Michigan-Wisconsin Bungalow at the Chicago and New York Forest Products Expositions.

The wood has an attractive figure, shows delicate shadings, is peculiarly susceptible of color staining, and when properly finished gives a decidedly rich effect.

The lumber is of excellent quality, easy to work, and, unlike other varieties of elm, it does not check, shake, twist or warp more than ash or oak.

It is used extensively for furniture and interior finish.

We will send you prepaid finished samples of Cadillac Gray Elm if you would like to see this beautiful native wood.

SAVE YOUR MONEY BY USING THE RED BOOK

Published Semi-annually in February and August

It contains a carefully prepared list of the buyers of lumber in car lots, both among the dealers and manufacturers.

The book indicates their financial standing and manner of meeting obligations. Covers the United States, Alberta, Manitoba and Saskatchewan. The trade recognizes this book as the authority on the line it covers.

A well organized Collection Department is also operated and the same is open to you. Write for terms.

Lumbermen's Credit Assn.,

Established 1878

608 So. Dearborn St. CHICAGO Mention This Paper 55 John St. NEW YORK CITY

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free

The T. Wilce Company

What Veneer and Panel Consumers Will Use in 1915

This information is shown in our service of veneer and panel consumers' requirements lists—complete according to 1915 requirements.

The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us give you the details.

HARDWOOD RECORD,

CHICAGO, ILL.

WALNUT AT THE SHOWS

Every indication is that American Black Walnut will again take a leading position at the furniture shows, which will be held next in January. Manufacturers who have been making a few numbers during the past six months will add to their line for the next season; and many additional houses will be represented in the American Black Walnut field. Furniture concerns and lumbermen interested in the furniture trade should consider these facts with reference to their own purchases of American Black Walnut lumber and veneers. For stocks ready to ship, see the list shown below.

HARDWOOD RECORD

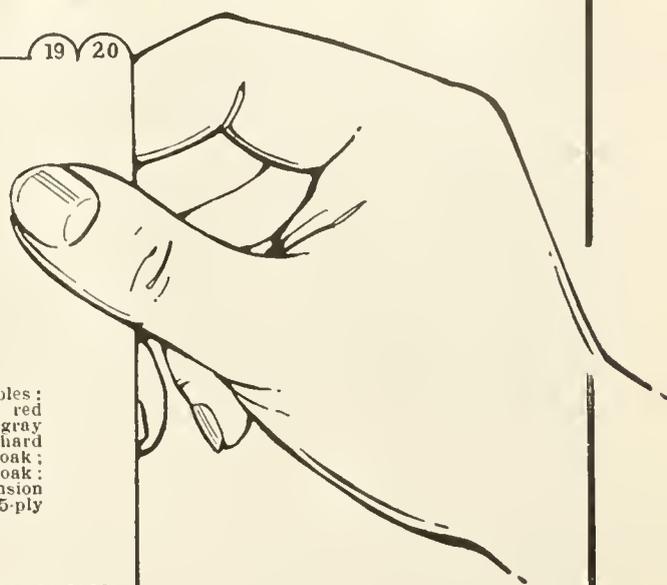

CHICAGO

NASHVILLE

THE LOGICAL PLACE TO BUY HARDWOODS

THE following is a list of stocks offered to the consuming trade by the hardwood lumbermen of Nashville. The character of the timber from which Nashville hardwood men secure their stocks places them in a peculiarly strong position as far as quality of lumber is concerned. Nashville lumbermen have always been noted for their strict adherence to all terms of sale, and in short have an enviable reputation for making good both as to the quality of lumber and as to grading.

The members of the Nashville hardwood trade solicit your attention to these facts and an opportunity of demonstrating their truthfulness.

Review and Outlook

General Market Conditions

VISIBLE EVIDENCE that the issues before the world are clarifying themselves, resulting in a feeling of a greater degree of confidence in the situation, and spreading optimism, characterizes the last couple of weeks' developments. This growing resolve to look for the silver lining is surely to be commented upon and commended, inasmuch as for the most part it is not directly the result of increased prosperity among those so inclined. However, there is a distinct inclination to view favorable business in other manufacturing lines as indicative of probable eventualities among those lines which have not yet felt any direct stimulus.

It is true, so far, that improvement has been confined to more or less special items which would naturally feel an increased call on account of the war time exigencies. But an analysis of our domestic condition reveals circumstances which cannot be overlooked. Unquestionably, the truth regarding the present and immediate future lies between the claims of the optimist and the pessimist. We should not be carried away by undue enthusiasm resulting from occasional spurts of business in specialized items, nor should we overlook the fact that the country as a whole must benefit from the basically strong condition underlying the whole proposition.

As a matter of fact, the balance of trade in favor of this country, which is increasing and has been increasing since the beginning of October, will go a long way toward smoothing the road to prosperity. To further help financial interests, bank reserves have changed from deficit to surplus in the principal banking sections, and the course of exchange has become increasingly normal. There really is no further serious concern over the financial future.

Our staple money-producing commodities, such as corn, cotton and grain, were seriously threatened by the tying-up of foreign shipments, but partial reopening of commercial highways has meant a tremendous relief and will result in relieving a very undesirable condition of financial stringency in the South and grain-producing sections. The importance of this is tremendous.

The average industrial line is operating considerably below full capacity, the most serious consequence being the reduced purchasing power of the operatives. In fact, the average production today is probably not more than fifty or sixty per cent of capacity. Nevertheless, there is a gradual resumption of normal working forces and normal hours. Everywhere there is a strong tendency to do everything possible to retain employes and provide for them a living to which they surely are entitled, and which can not rightfully be denied them as a result of conditions beyond their control, if it is a financial possibility to keep them in service.

We have 112,000,000 people here who have heretofore bought great quantities of raw material and manufactured products from abroad, the extent and variety of these importations never having been realized until we were forced to the knowledge when import shipments abruptly ceased. Surely there can be no question that prosperity will come as a result of supplying those 112,000,000 in our own country as well as taking care of our share of the duty of supplying the rest of the non-productive world.

Export inquiries are coming in for furniture, pianos and musical instruments, cutlery, hardware supplies and for an extensive variety of other products which will cover the manufacturing field, if not completely, at least to a sufficient extent to result in a general feeling of optimism regarding export possibilities.

The exports of lumber are gradually increasing in volume as the feeling of surety that shipments will reach their destination becomes more substantial. Of course, it will not be even a partially normal trade, but it must be remembered that the export mills with very few exceptions are shut down and are not accumulating stocks, but gradually reducing. As a matter of fact, while there is a considerable amount of lumber, the country-wide policy of curtailed production is already beginning to show its good effects in breaking stock, and following the completion of the inventory season, there is no room for doubt that the consuming factories as a general thing will show more active interest in the sawmill offerings.

The building situation is in fair shape and it seems to be strengthened by an easing in the financial situation, due to the emergency currency measure and it in common with other industrial lines has been benefited by the apparent change in political sentiment. Whether or not such sentiment is entirely justified is not as yet established. Nevertheless, there surely can be no one so partisan as to regret some change for the better no matter what the cause might be, or whose toes might be stepped upon.

One probable effect of the war will be that as available labor is decreased as combatants are killed or disabled the average wage will rise to a plane more nearly or a par with American labor. The effect is easily foreseen.

The buyers, according to first-hand interviews, are talking in a slightly different tone than they have been for some time. They are not actually placing orders, but seemingly are feeling out the situation in anticipation of doing so after the first of the year. We have been looking for this break that will result in business "after the first of the year" for some little time, but there is every confidence that the situation has so far clarified that there will be no slip-up in the course of events on this occasion.

The Cover Picture

FEW PERSONS WILL EVER again see a forest of wild cherry timber. Such have long been scarce, and are destined to become scarcer still. A single tree of this species, if of log size and good form, is no longer common. A member of the Pennsylvania Forestry Commission stated two years ago that he had found it necessary to travel over much of that state before he was able to find a satisfactory cherry tree to photograph. Yet central Pennsylvania western New York and northern West Virginia constituted the region of wild cherry's highest development in the primeval forests of this country. Depletion has progressed a long way when an extensive search is required before one of these trees can be found of a character satisfactory for a photograph, right in the center of cherry's natural range.

The picture which illustrates the front cover of this number of *HARDWOOD RECORD* is unusual. It is a stand of cherry timber which it would not be inappropriate to call a forest. It is about as nearly a cherry forest as anyone ever saw, even in the palmy days of lumbering this wood, some seventy-five years ago, when the center of the business was in western New York and northern Pennsylvania.

Pure forests of cherry of large extent were never known. The tree does not grow in that way. Stands of one or two acres were not unusual; but the habit of this tree causes it to grow dispersed among forests of other kinds of timber. The trunk's form is characteristic. It is seldom quite straight, but consists of long, slight curves or undulations. In a forest-grown tree, the branches are clustered at the top, and there are few of them, and the foliage is thin. Such a tree grows slowly, because the summer's leaves are not sufficient in quantity to furnish material for much growth. On the other hand, the open-grown wild cherry is limby almost to the ground, and it grows almost as rapidly as red oak.

It is the slow-growing forest trunk that produces the valuable cherry lumber of commerce. The annual rings are so vague as to be scarcely visible in a polished piece of wood; but a quickly-growing trunk has rings nearly as conspicuous as those of chestnut, and the wood lacks the evenness and luster so characteristic of cherry.

The lesson taught by this is that planted wild cherry will probably never amount to much in a commercial way, because if the trees are far apart, the rapidly grown wood will not be handsome; and if close together, so as to produce slow growth, the period of waiting for the timber to come into market will be so long that taxes and interest will eat the profit out of the investment.

The Story Told by Figures

OFFICIAL FIGURES compiled by the government are beginning to tell the story of the war's effect on the export of American lumber. Heretofore there has been considerable guessing as to what would happen, and some of the guesses have been found nearly correct. The export figures for September are now available, and may be compared with data for the corresponding month last year. It may be said, as a summary of the whole situation, that American exports of forest products have declined nearly everywhere, and have gained scarcely anywhere. Exports to some countries which are far removed from the scenes of hostilities have fallen off to a remarkable degree; but the largest losses have occurred in the trade of the countries actually at war, or in proximity to the troubled areas.

Italy furnishes an example of the war's blighting influence on trade, though Italy is at peace. In September, 1913, American exporters sold 5,878,000 feet of hewed and sawed timber in that country. During September of this year not one foot was sold there. Holland supplies another example. September sales last year amounted to 6,548,000 feet of timber, and not one foot went there during the same month this year. It is less surprising that the sales of this commodity in France and Germany fell from several million feet last year to nothing in the past September.

The only country in all Europe which bought hewed or sawed timber last September was the United Kingdom, that is, England, Scotland and Ireland. Sales there actually increased from 15,554,000 feet for September, 1913, to 16,263,000 for last September. In-

cluding all countries of the world, American sales of timber fell from 41,165,000 feet in September, 1913, to 21,214,000 feet for the same month this year, and from a value of \$824,575 to \$347,504.

The general showing the world over for lumber is about the same as for timber. The total fell from 213,654,000 feet for the designated month last year to 103,329,000 feet this year, a decline exceeding one-half. The only portion of the whole world which bought more of our lumber in September this year than last was British Oceania—that is, chiefly, Australia and New Zealand. It thus appears that Great Britain and its possessions were the only portions of the entire world that were able to increase their purchases of our lumber and timber in the face of the war. This is an instructive commentary on what it means to have control of the sea.

Sales of our furniture abroad have fallen to less than half, when the September of this year and last are compared, that is, from \$625,323 to \$252,512. Cuba is the only country that increased its purchases of our furniture.

If there is any comfort in the situation for our exporters of forest products it lies in the fact that the markets abroad are becoming empty and when foreigners again begin buying, they will purchase on a large scale to meet the demands of their customers. There is prospect that this will happen before long. Banking facilities between the United States and many foreign countries are being improved for the special purpose of encouraging trade, and when trade again sets our way it will come in greater volume and under better conditions than ever before.

Active Plans for Combating Substitutes

THAT CONCERTED ACTION has been necessary and is increasingly necessary in order that the firms and individuals engaged in the manufacture of lumber and its finished products may maintain a fair share of their legitimate markets in face of the growing propaganda of wood substitute advocates has been realized for a long time. The realization, however, has been individual and not collective in its character. No matter what the individual ideas of lumber manufacturers might be there could be no possibility of accomplishing anything to offset the ill effects of substitute activities without a concerted and aggressive movement binding the lumbermen as one unit in opposition to unfair methods which have been used in many instances in fostering the interests of substitute manufacturers.

The realization has recently been effected that it will be necessary to enlist the active co-operation of distributors of forest products in a pro-lumber movement in order to get in immediate touch with the ultimate buyer.

Such a policy has heretofore been difficult of consummation, as the distributors have for the most part not felt the decreased demand developing from substitutes in lumber, or at least they have not as a class realized that slackness in their business is due in part at least to this changed demand.

Seemingly they have at last realized the situation they are facing in common with the manufacturers and now seem entirely willing to co-operate with producers, especially to prevent the passage of anti-wood ordinances where these ordinances seem direct results of propagandist work of competitive interests.

Plans, as a consequence, are being worked out whereby producers and distributors will co-operate with associations now in the field for the purpose of discussing the whole subject.

The National Lumber Manufacturers' Association is behind the movement and will call a general conference of representatives of all branches of the trade to be held in Chicago during January, 1915. In order to prepare an intelligent program and to make the necessary arrangements, the National association has issued an invitation to the officers of all of the associations of lumbermen, including the local associations of lumbermen in various cities, to attend a preliminary meeting to be held at the LaSalle hotel, Chicago, on December 17.

Thus the question is brought squarely up to individuals representative of lumber organizations and it now devolves upon them to show that they are in earnest and that they fully realize the absolute necessity for checking the inroad of substitutes not only by attending

the meeting, but by coming prepared to offer intelligent and helpful suggestions. They will be treated with some excellent addresses by men in position to discuss various subjects coming under the general heading of inroad of substitutes. The program has tremendous possibilities and cannot but be of extreme benefit to those lumbermen who have the ambition to co-operate in this cause for the benefit of all. Surely nothing of more vital importance to every branch of lumber manufacturing has ever come up. The full co-operation of all lumbermen is deserved and should be forthcoming.

What the Foreign Trade is Offering

FREQUENT REPORTS OF SALES of large volumes of a variety of manufactured articles made in different parts of the United States are bringing pleasing smiles to the countenances of certain manufacturers. To a great extent this has been confined to lines that are, to say the least, remote from lumber, and the average lumberman has been rather inclined to treat the information more or less pessimistically as far as any benefit to him personally is concerned. He feels that a big sale of blankets, saddles and woolen socks, or any other similar article cannot by the most persistent use of the imagination be connected favorably with the lumber business, as far as constituting a good omen for the future of that particular industry is concerned.

This general attitude is rather unjustified as no one will dispute, upon considering the economic laws prevailing under such circumstances, that advancement in any line of industry in this or any other country, if that advance is at all consistent and continued, is going to react favorably upon all other lines, to a lesser degree it is true, but in the end to an appreciable extent.

Of course the orders which have been received have been a mere drop in the bucket of normal export volume, but it must be remembered that so far the tide across the water has but just started and the momentum which it is gaining is going to increase its force tremendously. As it increases, it is going to cover a greater variety of trades and even now it has actually touched the lumber business noticeably. As an instance, there is a firm manufacturing knock-down houses which has just received an order from the British government for 600 such structures, these houses to be used for winter quarters for the troops. As a consequence 7,000,000 feet of lumber manufactured in this country will go abroad in remanufactured form, which is an even better development from an economic point of view. The lumber trade has felt the effect of demoralization of sources of supply abroad in other ways also.

A very pleasing number of sales on different species of stock have been commented upon in these pages from time to time, and these sales have covered large quantities of walnut for gunstocks and other purposes. They have helped the poplar manufacturers, the belligerent nations having purchased very substantial quantities for mess tables. The oak manufacturers have felt the good effect to the extent that they have shipped oak for various construction purposes, for wagon building, for use in naval construction, and in other lines.

It is true, of course, that the warring nations have provided a great quantity of supplies of different kinds, Germany particularly having equipped herself with remarkable thoroughness. However, in the case of some of those nations which are now battling for their very existence, they have relied upon their abilities to secure raw material and manufactured articles from neutral nations rather than in the case as with Germany, of relying strictly upon their own accumulation of supplies and the maintenance of facilities for manufacturing them.

The result will be that as the conflict goes on and a greater and greater number of men is mobilized for army purposes, while at the same time various war accoutrements are being captured or destroyed, there will be increasing necessity for augmenting such supplies. No one doubts for a moment that the United States will furnish the bulk of the raw material at least.

Then it must be remembered that a vast quantity of canned goods will go abroad from this country, and all these goods are packed in boxes which in the main are made of wood. The box business is pretty active even under present circumstances, but it will be in-

creasingly so when the effect of this exodus of American canned foods begins to be felt.

The main point to be borne in mind, however, is that whether the exports are of lumber direct or of manufactured articles made from lumber, any prosperity resulting to any other American industries either as a direct result or as an indirect result of the war, is going to bring, to a corresponding degree, not only actual prosperity to those persons directly affected, but through increased purchasing power of many employes many other lines will be helped. It will have a strongly favorable mental reaction.

With the maintenance of a more sane and optimistic viewpoint, business will be benefitted tremendously. This country has not gone to the dogs nor is it going to the dogs. It is rapidly adjusting itself to conditions which it has never before been called upon to face. When this readjustment is completed, the thought of the country will be directed at the problem of increasing productive capacity rather than sales.

Opening for American Oak

AN INFLUENTIAL LUMBER TRADE JOURNAL of London recently criticized the government for specifying Austrian oak in a contract for book cases in one of the public offices. It was pointed out that there was other oak that could be had. The purpose of the criticism was wholly patriotic, on the part of the English editor who was naturally not pleased to see an order go to a country at war with England. Business men on this side of the sea observe proper neutrality, as between countries at war on the other side; but when it comes to selecting oak for furniture, the American dealer has a right to speak in behalf of American oak.

The international strife is breaking up old trade relations, and new ones will be established. When business is about to change hands, the American lumber dealer who does not try to get his share of the new deal is entirely too timid for his own good. If the English, for reasons satisfactory to themselves, should decide not to use Austrian oak, there is no reason why they should not use the American wood. It is of as high grade as Austrian oak, as high in class, as high in character of its service, and the only thing in which it does not rate as high as the Austrian wood is price.

The commercial oak of Austria, England, Italy, and of most other regions of southern and western Europe, is all of the same species. If there is any difference in the wood, it is a difference due to soil and climate. It is handsome and substantial. Its color is a little darker than old, mature American white oak, and not so dark as old red oak. It has a pleasing, subdued tone. It may be quarter-sawn, and that is sometimes done; but it is said that the plain-sawn stock is more popular in Europe; and it is certain that little quarter-sawn European oak is ever seen on this side of the Atlantic. When this oak comes over here it is sold at about double the price of mahogany.

It is not claimed that American oak is an exact substitute, but the claim can be made without reservation that it is as handsome and as serviceable. It would seem to be an auspicious time for American dealers in high-class oak, suitable for furniture, to gain a footing in European markets. It is useless to waste time with poor or common stock. The English are good judges of wood, and while probably somewhat severe in condemning what does not please them, they are fair in their decisions. The American oak should win on its merit, and it ought to be given a chance to take some of the market which Austrian oak seems in a fair way to lose.

One of the most expensive woods used regularly in an established industry in the United States is boxwood, the favorite material for wood engraving. It has been quoted at four cents a cubic inch, and about \$1,300 by the thousand board feet.

What is supposed to be record speed in getting men to a forest fire is reported from Oregon, where on one of the national forests, a ranger went to town, hired ten men, and got this force to the fire twelve miles away within forty-eight minutes after he was notified by telephone.

World Markets for American Lumber

BY HU MAXWELL

SEVENTH ARTICLE

Editor's Note

The eastern and southern regions of Asia are old in history but new in the lumber trade, so far as American supplies are concerned. Douglas fir from the Pacific coast of the United States is now beginning to enter some of the districts of India which ages ago shipped structural timbers 5,000 miles to the Euphrates valley to build cities which became ruined mounds centuries ago. Thus do the centers of lumber supply change. America is now one center, and Siberia is destined soon to become America's rival in the regions of eastern and southern Asia. At the present time the lumber exporters of the United States are securing a foothold. It is no more than that yet, but the trade should greatly increase in the near future. Asia is populous; it has valuable resources; its people have been traders for thousands of years, and they are anxious to extend their export business. The time is opportune and the occasion is favorable for pushing our trade in that field. The Panama Canal is open, and it should lead to an increase of hardwood products in our business with Asia. The disturbance of former trade relations between that region and Europe ought to increase opportunities for export of American lumber to the Orient.

The countries of eastern Asia constitute a field for the sale of American lumber, but it awaits development. At a few points here and there a market has been found, and in certain centers the sales have been satisfactory; but as a whole, and considering the extent, resources, and population of the region, only the first steps have been taken toward placing American forest products on a proper footing there.

The trade has been confined almost wholly to species which are lumbered in California, Oregon and Washington, therefore, softwoods. The eastern hardwoods have not yet entered, except in the form of cooperage, furniture, or some other manufactured articles; and the trade in these articles has not been large.

At the present time there is no reason to expect much increase in our exports of hardwood lumber to eastern Asia. That region's hardwood resources are as large as ours, at least in variety, and apparently in quantity also. It would seem that whatever field is open in eastern and southern Asia for the sale of American hardwoods will take finished products rather than rough lumber.

The prospect is quite different and much more encouraging for American softwoods. When they reach the shores of Asia they are not compelled to compete with native softwoods on such a close basis that all profit is squeezed out of the transaction. There are softwoods in eastern Asia, but south of Siberia they are of a rather poor kind; and, except small stuff, they are not plentiful. This can be shown more fully by a brief discussion of the probable supply of timber in the leading Asiatic regions where the American lumber dealers are looking for trade.

Siberia

Siberia, as is well known, is a province of Russia. It is a vast region with resources very similar to those of Canada, and its area is even greater than that of Canada. It has 27,000 miles of navigable rivers. One railroad crosses the country from east to west, and there are branch lines of considerable length, but aside from these railroads and the rivers, the country is without facilities for moving heavy freight. The State of Illinois has more railroad mileage than all of Siberia. It is apparent that the forest resources have not been greatly developed under such conditions. Nearly all the natives are of Mongolian or Chinese origin; but in recent years many Russians have settled in the country, and a few people of other nationalities. Practically all of Siberia, or as much of it as was considered worth claiming, was at one time or another a part of the Chinese Empire.

Its forest areas are enormous. They extend 4,000 miles, from the Ural Mountains to the Pacific Ocean. They run north until they finally disappear in the cold country toward the Arctic ocean, just as the case is in Canada. Southward, they overlap into China; but in the southern portions there are treeless regions as well as forests; while in other parts of southern and eastern Siberia the wheatfields resemble those of Manitoba. The clearing of land for agricultural purposes is in active progress, and forest fires are ruining large areas of forest, exactly as has happened in the United States and Canada.

SIBERIA'S FOREST RESOURCES

Apparently no official survey of Siberia's forests has been published; but travelers have crossed the country in every direction, and from their descriptions a general idea of the timber resources may be

had. One of the books ("Siberia and the Great Siberian Railway") gives a good summary in a single paragraph:

"There are many localities where for tens or hundreds of miles in every direction stand clean plantations of pine which, with their interlaced summits, hide the sky. The absolutely naked trunks, rising perfectly straight to an enormous height, are so monotonous that a man who once chanced in such a part of the Siberian primeval forest, cannot find his way out again."

A partial list of the timber trees of Siberia is given below. Some of these at the present time are so remote from means of transportation that they cannot reach market for years to come. In fact, most of the timber of Siberia is in that situation.

By consulting a map of the country, it is seen that nearly all the large rivers of Siberia flow away from the railroad; that is, the railroad through the country crosses the headstreams of those rivers. They cannot be utilized for floating logs to the railroad. If lumbermen should try to float logs or rafts on them, the farther they floated, the greater distance they would be from market. Therefore, the country's forests cannot be marketed at the present time by using the rivers as means of transportation; but additional railroads must be built, which, in time will be done.

Among the timber trees of Siberia which are now of commercial importance, or promise to be in the future, are a number of oaks. The Japanese oak is one of them in the southeastern part of Siberia and over the border in Manchuria. This oak is regularly sold in the Pacific coast cities of the United States where it competes directly with American oaks. It competes also with American oak in some of the European markets, and, of course, it is so firmly established in the markets of eastern Asia that oak from the United States has little chance there.

JAPANESE OAK

Japanese oak is not a single species, but consists of at least three. In most markets all pass as one. All are found on the mainland of Asia, though probably all are not met with as far north as Siberia. The supply seems to be ample. These oaks occur over a region half as large as the United States, but are lumbered principally in southeastern Siberia, Manchuria, Korea, and Japan. This oak appears to be the most important hardwood of eastern Asia, and American exporters will meet it in many markets.

Siberia has three elms, *Ulmus campestris*, *pendiculata*, and *montana*. It cannot be ascertained that any of this wood is now going to market outside of Siberia. Supplies are said to be large.

The country has at least four kinds of maple, but there is little information concerning quality, but in some regions the trees reach large size.

Two species of ash occur, *Fraxinus excelsior* and *manshurica*. The wood looks like the common white ash of the United States.

There are large forests of birch. Trees are generally small and are similar to the white birch of New England.

Aspen or popple is abundant and is of the same quality as that growing in New England and the Lake States.

There are three species of basswood in Siberia, and they are said to be of excellent quality and abundant.

Two walnuts are native in the country. They closely resemble Circassian walnut, but they are more valuable for the nuts they bear than for the wood; consequently, little Siberia walnut lumber reaches market. The two species are *Juglans stenocarpa* and *manshurica*.

The foregoing are hardwoods. They are not the rivals most to be feared by American lumber exporters. The softwoods from the Siberian forests may be expected to make a fight for the markets of eastern Asia, though they have not yet done so. If the popular names of the softwoods are relied upon, there is danger of error in classifying them. What is called "Ayan pine" is a spruce (*Picea ajanensis*); another called pitch pine is likewise spruce (*Picea orientalis*); the tree known as Siberian cedar is a pine (*Pinus cembra*). The Siberian fir (*Abies sibirica*), the Siberian larch (*Larix sibirica*), and Dahur larch (*Larix dahurica*) are softwoods growing abundantly over large areas. Another pine (*Pinus communis*) is said to be plentiful. Manchurian cedar, an important timber tree, is another case of misnaming. It is not a cedar but a pine (*Pinus manshurica*).

The foregoing Siberian softwoods may be expected to put in their appearance in the markets of eastern Asia as soon as transportation facilities provide means for taking them out of the forests.

Time only can tell how keen will be the rivalry further south in Asia between these Siberian softwoods and those exported from California, Oregon, and Washington. There is little rivalry now, because the Siberian product is not going to market in distant regions. Douglas fir and redwood from California and Washington can be laid down in Hongkong, Singapore, and other ports of China and the southern countries at less cost than can the softwood from northern Asia. That may not be the situation always.

If general descriptions may be relied upon, Siberia has much large timber; but absence of exact information on this subject should be noted. Probably the country produces nothing of size to match the large structural timbers cut from Douglas fir.

Japan

Though Japan is a small country, it produces large quantities of timber. Forests are cared for like farm crops, and lumbering is carried on after the most economical methods. The wooded lands cover 55,000,000 acres. These are stocked with the best classes of timber, and the yield per acre is high. The oak was mentioned above in connection with Siberia. Practically all Siberian species grow also in Japan, but the thrifty Japanese do not permit unprofitable kinds to cumber the ground. The best kinds are given the best chance. The result is that Japan, in proportion to its size, is probably the best timber producer in the world. Its lumber merchants are keen competitors of the Americans in the markets of eastern Asia. However, the Japanese are handicapped in markets where large dimensions are wanted. They have nothing to match Douglas fir cut in Washington and Oregon. They cannot afford to let their timber stand long enough to attain such sizes as are common in the forests of our Pacific coast states.

Japan's strong point in contending for markets is in pushing small sizes of timber vigorously wherever purchasers are to be found. Utilization is close and prices can be made low. Railroad cross-ties constitute an important item in Japanese exports. Their carefully managed forests produce these in great numbers. They can grow a carload of cross-ties on a plot of a few square rods, and they have the knack of making every rod count. The Japanese oak which in California, Oregon, and Washington, is beginning to crowd out American oak, is grown in the same economical way. Individual transactions are small, but the American lumber exporter to the Orient will find Japanese forest products the keenest rivals that he will be called upon to face in that field. However, that competition will be less severe where dimension stock of large size is concerned.

China

The popular belief that China is a country without timber is wrong. The income from its forests exceeds that of Japan, but China is a much larger country. However, the typical Chinese forest is a thing different from what it is in America. The Chinese do not grow timber, they grow poles. They plant the seed and care for the plantations; but when the poles are from six to twelve inches in diameter, they are ready for the market. "Foochow poles," so named from the district where most of them are marketed, are sold by the million. The sales annually at one depot to which place they are brought down the rivers, amount to \$5,000,000. The region back

of Foochow, toward the interior, has been described as "resembling a crazy quilt," with its thousands of woodlots of evergreen trees interspersed among thousands of farms.

China is a large country, and all kinds of conditions prevail. Some vast regions are absolutely treeless, others are fairly well timbered. The poles are not sawed into boards. Their principal use is for house posts. Houses there use many posts to support the walls and porches. The poles are all softwoods, usually pine and fir. They are rough and knotty, and are often used without much dressing or smoothing. In fine buildings these rough, knotty poles may be covered with gilt or paper to hide the knots.

The exporters of building lumber to China must meet that competition. Chinese shacks have little use for sawed beams, rafters, and siding. Poles, bamboo, thatch, brick, and tile are the building materials. The construction timbers sent from America are bought by the builders of railroads, wharfs, and modern works of various kinds. China now has 6,000 miles of railroads, and a program, which will doubtless not be carried out for a long time, provides for 75,000 miles more. Suu Yet San's scheme called for railroads crossing the empire in various directions, ultimately connecting with western roads at Constantinople.

The lack of roads in China makes the distribution of lumber difficult. Boats on the rivers reach portions of the interior, but nothing heavy can be moved inward from the river banks. There are no roads, and wagons are practically unknown. Highways are usually paths for footmen or for wheelbarrows.

Southern Asia.

The countries of India, Siam, Burma, Indo China, and the Malay Peninsula constitute a densely populated region of southern and southeastern Asia where some American lumber is beginning to find its way. Our exports to those countries are principally softwoods. Little prospect is seen for a hardwood market there, because those countries have hardwoods of almost infinite variety. With such they supply not only their home demands, but they export certain kinds to America and Europe. Ebony, padouk, teak, and satinwood are well known imports into the United States from those countries. There are many more which occasionally come to us, and hundreds of others would come if our markets would take them.

It would appear to be a hopeless case for America to attempt to secure a foothold for its hardwoods in southern Asia in face of the almost infinite variety of native woods which would be active competitors; but there is good prospect of increasing the sale of certain articles there, which are manufactured in part of American hardwoods.

Agricultural implements are the most promising class. American manufacturers of such implements consume 321,000,000 feet of wood yearly, and any extension of the market for the product will increase the sale of hardwoods. There is a small market in that region for American furniture and for vehicles, and a prospect of increasing the market. Some supplies of that kind, which formerly came from Europe may be expected to drop out of the markets of southeastern Asia, and Americans ought to be able to make substantial gains there.

The prospect for an increased sale for softwoods in that region is encouraging. Most of southern Asia is tropical or semi-tropical, and softwoods are usually rather scarce in such climates. The mountains of northern India produce cedar and pine, and some of the timber is of large size and excellent quality; but it is too far from the coast to compete seriously with the cheap and abundant softwoods of Washington, Oregon, and California, especially on the eastern coast of southern Asia, where the American woods are securing a foothold.

Although labor is cheap in southern Asia, lumber operations are expensive because of the primitive methods in use in cutting the timber and bringing it out of the forest, and also because much of the timber is remote and scattered. Teak in the Rangoon country, it is said, scarcely averages one good tree to the square mile. Some of the timber which reaches the market on the coast of Siam and Indo China has been floated a thousand miles down rivers. Timber from Washington and Oregon should have no difficulty in competing with native timber of southern Asia which reaches market along a route so expensive.

Exports of Lumber

The exports of lumber and other forest products from the United States to the countries of eastern and southern Asia for 1913 are shown in the following statistics:

Round timber amounting to 11,000 feet, board measure, was shipped to Hongkong, while Japan bought 753,000 feet. Hongkong bought 14,000 feet of square timber, and Japan 241,000. Lumber shipments to the various countries are here shown:

Country	DOUGLAS FIR	Feet
China		89,510,000
British India		11,698,000
Japan		14,312,000
Hongkong		6,760,000
Straits Settlement		228,000
Korea		155,000
Siberia		19,000
Total		125,682,000

China purchased 37,000 feet of shortleaf pine lumber, 78,000 of spruce, and 319,000 of all other kinds, and Hongkong bought 123,000 feet of miscellaneous kinds. Redwood found purchasers in the following amounts: British India 2,000 feet, Hongkong 15,000, Japan 64,000. Forty-one thousand shingles were shipped to Japan.

COOPERAGE EXPORTS

The countries of eastern Asia are good customers of American boxes and cooperage, as the following figures of exports for 1913 shows:

Country	BOX SHOOKS	Value
Straits Settlement		\$2,466,632
Hongkong		541,750
China		304,948
Japan		172,030
British India		5,922
Siam		36
Total		\$3,491,288

Country	BARREL SHOOKS	Value
China		\$171,638
British India		2,851
Hongkong		100
Japan		100
Total		\$177,692

Country	STAVES	Number
China		220,780
British possessions		154,298
Total		375,078

Country	EMPTY BARRELS	Value
China		\$20,212
British India		16,600
Hongkong		73
Japan		38
Total		\$36,923

Country	OTHER COOPERAGE	Value
China		\$ 9,221
British India		8,444
Japan		2,687
Siberia		57
Hongkong		25
Korea		10
Total		\$20,444

Country	SASH AND DOORS	Value
Korea		\$1,796
Japan		629
British India		450
China		175
Siberia		36
Total		\$3,086

Country	FURNITURE	Value
British India		\$ 74,900
China		25,125
Straits Settlement		15,422
Japan		11,830
Korea		6,812
French China		4,791
Hongkong		3,532
Siam		2,056
Japanese China		991

German China	352
Siberia	209
Persia	133
Total	\$146,153

Country	TRIMMINGS AND MOLDINGS	Value
British India		\$5,591
Japan		1,608
Korea		1,385
Straits Settlement		525
China		483
Total		\$9,592

Country	INCUBATORS	Value
British India		\$470
China		286
Japan		122
Straits Settlement		50
Total		\$928

Country	WOODENWARE	Value
British India		\$4,175
China		2,258
Straits Settlement		623
Korea		50
Total		\$7,106

Country	WOOD PULP	Pounds
British India		84,158
Other British possessions		9,052
Straits Settlement		6,701
Total		99,911

Country	OTHER MANUFACTURES OF WOOD	Value
Japan		\$ 84,978
China		13,155
British India		10,133
Hongkong		7,342
Korea		2,615
Straits Settlement		2,418
Siberia		716
Arabia		281
Siam		258
Total		\$121,797

Eastern and southern Asia are qualified to carry on a large timber trade with the United States. They have abundant products to exchange with us, and many ways in which they can use American lumber. Nearly or quite one-half of the world's population is contained in the countries of eastern and southern Asia. This enormous population is not found on the immediate coast only, but it is within trading distance of the coast, if means of inland communication were modernized. That will not be fully accomplished for many years; but in the meantime there is room for a great expansion of our lumber trade in those regions.

Distance From Markets

Asia is no farther than South America from the Pacific coast of the United States. The distance from Seattle to Japan is 4,200 miles, and from San Francisco 4,536. Of course when the coast of Asia has been reached, it is still a region of "magnificent distances." The markets of China, Siam, and India are far beyond Japan, but the distance is easily and quickly covered by the fast ships that distribute our Pacific coast lumber to many remote parts of the world. Distance is not a serious problem in the lumber trade when transportation follows the routes of the high seas.

The shipment of furniture, cooperage, and other manufactured forest products from the eastern, middle and southern states has been greatly helped by the opening of the Panama canal. Cargoes can now be sent by water from origin to destination, which formerly were shipped by rail to San Francisco or Seattle, and transhipped from those ports by water.

The eastern coast of Asia, principally China, is anxious to find increased markets for tea, rice, silk, furs, chinaware, and certain kinds of woodenware and furniture. India has much the same class of articles to sell, with others in addition. With these commodities they can pay for lumber and other forest products which we sell them. Trade is seldom one sided. There must be an exchange of commodities. Those regions of Asia are as anxious to sell to us as we are to sell to them. When that condition exists, the way is easily opened for profitable trade both ways. Ships that go loaded one way are not under the necessity of returning in ballast.

Chair Makers' Annual

The annual meeting of the National Association of Chair Manufacturers came to a close November 13, at noon, following beneficial discussions and the transaction of business of importance.

The following officers will serve during the approaching year:

PRESIDENT, A. W. Highfield, Superior Wis.

VICE-PRESIDENT, Ashton P. Derby, Gardner, Mass.

TREASURER, Nels Johnson, Chicago, Ill.

SECRETARY, J. L. Malby, Chicago, Ill.

EXECUTIVE COMMITTEE: Calvin H. Hill, Chicago, Ill.; E. A. Zundell, Sheboygan, Wis.; J. H. Conrades, Jr., St. Louis, Mo.; K. P. Burkhardt, Dayton, O.; M. J. Murphy, Detroit, Mich.; C. F. Finch, Thomasville, N. C.; M. H. Gunlocke, Wayland, N. J.; F. M. Fenton, Buffalo, N. Y.; M. J. Greenwood, Gardner, Mass., as well as all officers.

The opening session was given over to the hearing of addresses of welcome and responses. The first session was called to order by President Highfield and George S. Powell was the first speaker. He welcomed the visitors to this city on behalf of the city of Asheville, the local Board of Trade and the Appalachian Park Association. He said that in selecting Asheville as the place of holding their meeting, the chair makers eliminated all spirit of commercialism, remarking that the visitors to and residents of the "Land of the Sky" are so busy drinking pure mountain water, seeing sights of grandeur and exploring excellent systems of highways that they have but little time to use chairs.

On behalf of the Western North Carolina Lumber and Timber Association President W. O. Riddick welcomed the visiting manufacturers to this city. He referred to the fact that Asheville is in the midst of a great hardwood district and invited the visitors to visit the various lumber plants of the western counties of North Carolina before returning to their homes throughout the country.

Mr. Conrades responded to the addresses of welcome, stating that the members of the organization are delighted with the city of the clouds and have been impressed with the spirit of hospitality in evidence on every hand. He remarked, however, that the chair makers would not be able to spend a great deal of time in the pursuit of pleasure, saying that the meeting was purely a business session at which the manufacturers would discuss matters of vital interest to their commercial welfare.

One of the interesting features of the meeting was the decision of the organization to use its influence to secure country-wide endorsement of the movement to hold but one exposition a year, this decision being reached following an interesting address delivered by Mr. Derby, who urged such action. In presenting the matter, he declared that the holding of various shows in many different sections of the country works a hardship on the manufacturers and the jobbers, the cost of making the exhibits at all seasons and in different sections being a heavy expense on the former while the expense and loss of time necessary to attendance upon many expositions each year keeps the attendance small among the latter. Benefit will accrue both to the manufacturers and the jobbers by holding but one exposition a year, the speaker declared, and in this declaration he had the endorsement of the other members of the organization.

The discussion of factory efficiency by L. J. Cleary, Grand Rapids, Mich., was heard with close attention. Mr. Cleary declared that the manufacturer must devise methods which will make all of his departments work in harmony with the minimum expense, loss of time, wear and tear of machinery and accidents to employes. He gave some interesting experiences gained along these lines. Following his address, the members exchanged ideas as to the best methods of producing a product which will not suffer in quality at a smaller outlay of money.

Chairman Fenton, of the committee on freights and tariffs, reviewed the work of his committee during the past year and reported that excellent progress is being made on the movement looking to the adoption of a uniform classification of chairs and other packages shipped from chair factories, both in carload lots and smaller quantities. The speaker said that the members of his committee are impressing upon the freight officials of the different railroads that the association is not antagonistic to the interests of the carriers but is

desirous that chairs be handled with a fair profit and with the minimum loss of time and breakage. He said that many reports have been investigated during the past year, and expressed his appreciation of the services of the other members of his committee and the spirit of co-operation manifested during the past twelve months among the members of the organization.

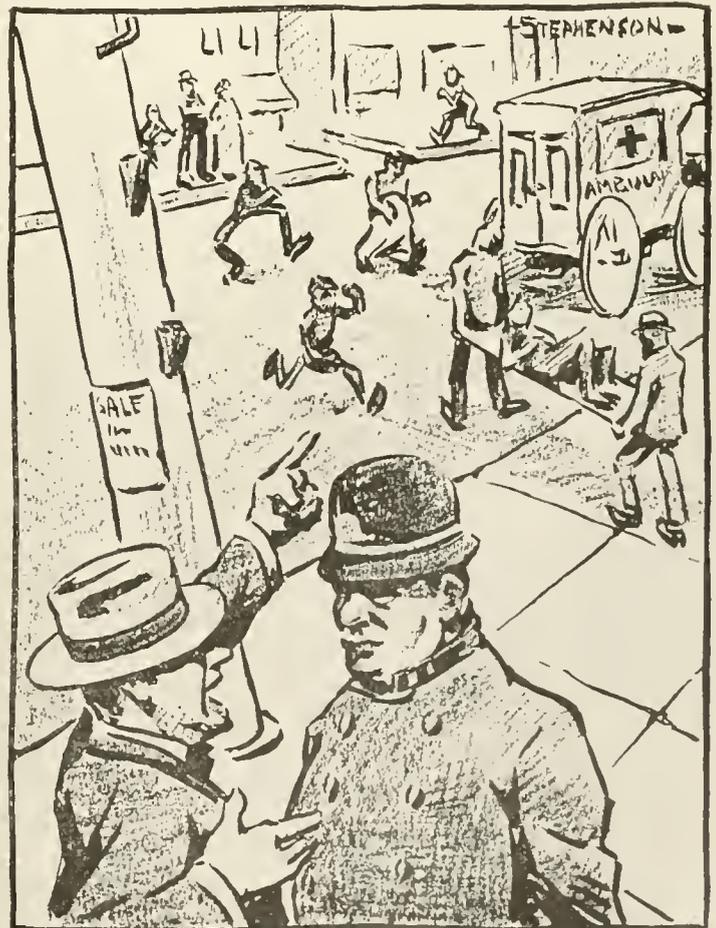

J. T. Ryan, High Point, N. C., secretary and treasurer of the Southern Furniture Manufacturers' Association, spoke at length on the problems which have confronted that organization during its career and the methods which have been resorted to in solving them. He said that the question of freights and tariffs had given the members no little trouble and gave some of his experiences.

It was decided at this meeting to hold the association's next meeting at Chicago on May 14 and 15.

The King of England has given permission to have a part of the royal estate placed at the disposal of the school of forestry at Cambridge University for purposes of experiment and demonstration.

The Russian government has placed an embargo on all kinds of lumber, to prevent its exportation; walnut lumber, including Circassian walnut, much prized by American furniture makers, is specifically mentioned.

Recent experiments indicate that round timbers of all the pines, of Engelmann spruce, Douglas fir, tamarack, and western larch, can be readily treated with preservatives, but that the firs, hemlocks, redwood, and Sitka spruce, in the round, do not take treatment easily. This information should be of value to persons who contemplate preservative treatment of round posts, poles, or mine props.

EXCITED BYSTANDER: "What's happened, officer; Is he hurt?"
OFFICER: "Naw, he just sold a car of lumber."

The Lumbermen's Round Table

Importance of Proper Piling

Never has importance of proper piling of hardwoods been more thoroughly or more widely demonstrated than during the past year. Those who have their lumber stock well piled find that it has benefited by waiting for orders because it has dried out more thoroughly, thus reducing the freight item enough to pay interest on the capital involved in carrying the stock over. On the other hand where lumber has been improperly piled the result of delay, and standing in piles, has meant depreciation in value. It has led to crooked stock and to stain and decay, and where too close to the ground on poor foundations it has been an invitation to worms and insects. One of the important lessons the trade has learned the past season is that proper piling is worth while, and if this lesson is taken home more care will be taken, both in the equipping of foundations and in piling the lumber.

Different Angles of the Selling Game

During the period of the slow movement of stock there was in evidence several radically different ideas as to what should be done about the selling end of the business. Some, realizing that it is not a time to push business but to go slowly and wait for the demand to revive, take life lazily and pass considerably more time playing golf than they would have done had the lumber trade made heavier demands upon them. Others feel that the way to stir things up is to get out and hustle, and the harder it seems to sell stock the more industriously they circulate over the territory so as to get what orders are to be had. There is no question of the good logic of letting the trade rest at times and letting up on the effort to force sales. This is logic founded upon sound reasoning. On the other hand, there is no question but that the fellows who industriously cover their territory while others are taking their ease get some of the trade that might otherwise have gone to their competitors. So there you are, and you can take your own choice as to which is the wiser course. The interesting point is seen in the different angles from which different people view the matter. Some of those who keep quiet and hold their lumber may eventually be more benefited than had they pushed sales more energetically. On the other hand, some of the industrious fellows have gained a foothold that will make them more important factors in the trade in the future.

The Advertising Side

One of the interesting and important phases of every business is the advertising side. Sometimes, too, some queer contradictions are presented. When business is good there is some disposition to treat the question of advertising lightly. On the other hand when a business depression comes along many people seem to think the place to cut down expenses is in the advertising. The fact of the matter is, there is seldom a time when it pays to let up on advertising, except when one is preparing to retire from business, and then there is some special advertising called for to clean up the business and sell out the assets. If there were ever a time when it is a mistake to curtail, that time seems to be right now, especially in the lumber trade, and the logic may apply to many other lines. There is a shifting about, an opening of new channels and a general reorganization in trade lines, and the man who would keep in touch with these and get what is coming to him is losing an important line of connection when he cuts down his advertising. The new customer looks over advertising in the trade papers to find what he wants and it is through trade paper advertising that most of the new connections for fresh channels of trade will be built up. That is why it would seem false economy to trim down on advertising at a time like the present. Instead of doing that, those who want business should be making their wants known and should be exploiting their business conspicuously through advertising.

The Item of Rosewood

Rosewood is an item in the cabinet and some other branches of the lumber trade that many people have mistaken ideas about. Rosewood is considered by some as being a relative of mahogany, though

somewhat redder. In reality it is more closely related to ebony. It is dark and heavier than mahogany and it is difficult to get it in wide boards or big logs. The logs are usually small and rough and, in size and shape, suggestive of Circassian walnut, but much heavier. Rosewood is often sold by the pound at prices varying from about three cents for the logs to fifteen cents a pound for bits of rosewood lumber. Since it is a decidedly heavy wood it doesn't take much of it to weigh a pound and it really is entitled to be classed as one of the most expensive of the imported woods used in this country.

Odd Effect of Price Slashing

"It is a peculiar fact," said a hardwood man who had just come in from a selling trip on the road, "that a man can overreach himself even in price cutting to sell hardwood lumber. I have met in my rounds some remarkable offers in the way of low prices on stock, evidently made by men who were desperate to get business and thought that was the way to do it. Their prices were so much lower than those generally quoted by reputable concerns that the prospective customers are afraid of them. I have sold to men who had prices so much lower than mine that it would make a big difference in a carload of stock. They were, too, men who were looking for bargains and driving prices down to the lowest notch. Yet when some fellow came along with too much of a cut in prices they were afraid the excessive reductions could be made up only by a shading in the quality of stock, inferior service or some other item. It is likely that an occasional cut of a dollar or two does land an order here and there, but those who have thought they could surely land business by making deep cuts have simply overreached themselves and scared their customers out of buying."

This incident strongly supports an idea that has been advocated heretofore, that invariable price cutting creates an impression of inferior quality, whereas to ask a higher price than usual, while it may not land a sale at the time, does leave an impression of quality of a superior product, and that is worth something. It is worth more, perhaps, than many a lumberman gives it credit with being.

Walnut Is Still Coming

Manufacturers of American black walnut are jubilant over prospects for the January furniture shows. Though the wood was prominent at the July exhibitions, something like two score factories showing walnut goods, a much larger number of furniture houses will include walnut in their lines in January, it is predicted, while those which have been using the wood during the past year will be able to make a more elaborate and inclusive exhibition. Since July, too, a number of manufacturers have begun to try out walnut, and have had sufficiently good results to warrant the development of this feature, and their displays will, of course, include something in walnut.

Walnut men are also noting with much interest that retail furniture dealers in a good many cities are featuring walnut furniture in their newspaper advertising. This is especially pleasing in view of the fact that it is disseminating information about the situation among ultimate consumers, whose verdict, in the last analysis, must be heard before reaching a conclusion on the subject. This publicity is not only stimulating interest on the part of the public, but it is also resulting in calls for walnut goods from dealers who have not been carrying them to factories which have not been making them, and is thus helping to get other manufacturers started along this line.

Altogether, prospects in the furniture trade are declared to be unusually good.

Outside of its use for fence posts, black locust finds its principal utilization in insulator pins and brackets for telegraph and telephone lines.

One hundred shade trees will be planted by the Massachusetts Forestry Association in cities or towns of four population classes which win prize contests for excellence in street tree planting.

The Greenheart Industry

BY C. D. MELL, FOREST EXAMINER, FOREST SERVICE

A new foreign wood often meets with a very indifferent reception in the American markets, and the enterprise of commission merchants and timber dealers in their attempts to develop a market for a little-known wood, is, as a rule, ill requited. Sometimes the fault lies in not properly grading the wood that is shipped, but more often certain kinds are selected which satisfy no present want and for which a demand has first to be created. Although the wood itself may be intrinsically valuable, and may subsequently come into general use, yet the process of establishing a

years, it did not reach the American markets until a few years ago. It is the opinion of those who are familiar with this wood that if it were better known it would enter largely into construction in the United States, especially in places where timber of a more perishable character cannot be employed, and where, in consequence, some more expensive material has to be substituted. A number of attempts were made in the past to interest marine architects in this country to specify greenheart for wharf and boat construction, but in nearly all cases the high price of the rough hewn logs served to discourage its use.

It seems opportune to dwell briefly upon the character of the greenheart tree, as well as upon the qualities and uses of the wood, which is recognized abroad as the foremost timber for marine construction. The consideration of greenheart is especially appropriate at this time, because it is now being used on the lock and dock gates on the isthmus, which is the best means of bringing it to the notice of those by whom alone greenheart can be brought into still greater repute. Greenheart cannot, therefore, be regarded as an altogether new wood in this country for marine structures. There are a great many other uses to which it can be put, and the sooner these become more generally known the greater will be its use.

The greenheart is one of the *Nectandrae*

SHOWING THE STAGING ON WHICH THE MAN WHO SELLS THE TREE HAS TO SUPPORT HIMSELF. IT IS SAID THAT THE WOOD NEAR THE SURFACE OF THE GROUND IS TOO HARD TO BE CUT WITHOUT BREAKING THE AXE, AND FOR THIS REASON ALL TREES ARE CUT FROM SIX TO EIGHT FEET ABOVE THE GROUND

A GROUP OF GREENHEART TREES

A MASSIVE GREENHEART TREE FALLING. THE LOG OBTAINED FROM THIS TREE MEASURED 85 FEET IN LENGTH AND 14 INCHES SQUARED IN THE MIDDLE

trade among large wood users who generally have strong prejudices against a wood not well known, is so slow that the original importer almost invariably suffers loss. Deficiency of information concerning the origin and properties of a new wood is another fertile source of injury to experimental importations.

Timber is one of the most important requisites in the arts and manufactures, and although in these days iron and steel have superseded wood for shipbuilding, and concrete is now largely employed for wharf construction and various other purposes, yet wood never can be entirely supplanted by its formidable rivals. Chief among the uses requiring strong and durable woods are ship and harbor construction. The native timbers that excel for these purposes are becoming rather scarce, or cannot compete with certain new woods that can be obtained from other countries. The various powerful tendencies of modern building and marine construction seem to point strongly toward a larger consumption of foreign timber.

One of the best timbers in the world which has recently attracted some attention in this country for marine construction is the British Guiana greenheart. While this wood has been known and used rather extensively in England, Holland, and France during the last hundred

so common to the tropical parts of South America. This species, which is botanically known as *Nectandra rodiaei* Schomb., is found principally in the Guianas and eastern Venezuela. The largest and most desirable trees grow just back of the alluvial deposits and in the slightly elevated regions where the soil consists of clay and sand. It is a large, evergreen tree, ranging from sixty to one hundred feet in height, and from two to four feet in diameter. The mature trees are without branches for three-fourths of their total height. They

generally have clean, symmetrical boles for the first fifty or seventy feet, and timbers from eighteen to twenty inches square can often be obtained. Logs eighty-five feet to the first branch and fourteen inches square have been cut. The crown is open and broad, with a few heavy branches.

The sapwood of greenheart is usually of a pale yellow color and the heartwood varies from a light grayish-brown to cinnamon or almost black. On exposure the wood invariably turns darker. The color of both the heartwood and sapwood varies considerably in different trees, and in different parts of the same tree. The heartwood may, in fact, vary from pale yellow to black, and just what the actual color is cannot be ascertained until the sapwood has been cut through. The proportion of sapwood is usually excessive, especially in young trees, often amounting to one-fifth, and sometimes one-third of the volume of the trunk. This, however, has little effect upon the lasting qualities of wood when used above water.

The heartwood of greenheart is exceedingly hard and heavy (specific gravity ranges from 1.08 to 1.32, or about 75 pounds per cubic foot), tough, strong, elastic, and fine-grained. It is said to be the strongest timber in use, with a crushing strength of 12,000 pounds per square inch, sixty-five per cent greater than that of English oak. In a smooth transverse section (unmagnified) it resembles superficially the wood of a palm. Greenheart takes an exceptionally fine polish, and works comparatively easily when its extreme hardness is considered. It warps and shrinks very little, and is, therefore, often worked up before it is thoroughly dry, because it can be manufactured more easily in the green state than in the dry condition. Users of greenheart in England never specify that the wood shall be seasoned when they order a cargo of logs. While the logs are apt to open up at the ends, there are no checks along the sides. It stands wear and tear better than almost any other wood, and is, therefore, employed rather extensively for flooring, and has been known to last from fifty to seventy-five years without showing any signs of wear or decay. Greenheart is a fire-proof wood, and for this reason is preferred for buildings. When the cathedral in Georgetown, British Guiana, was destroyed by fire a year ago, the foundation timbers, which were greenheart, were found in almost perfect condition after the fire and were used again in another building.

Greenheart enjoys the unique distinction of being proof against the attacks of marine borers and other destructive animals. The remarkable lasting qualities of mature greenheart wood have given it a world-wide reputation. Exposed to the alternations of air and weather, soil or sea-water, it is not materially affected, remaining perfectly sound after many years of trial. Authentic records show that the best grades of the wood surpass iron and steel in durability. Other considerations of importance are large size and reasonable cost as compared with timber of the same class now available in this country. These facts place it in a class by itself, and it is naturally in demand for such purposes as in ship and dock building, especially for keelsons, beams, engine bearers, planking, dock gates, lock gates, piers, and piling. It has been known to stand in wharves for a period of sixty years, and logs of greenheart which were under water for one hundred years have kept in perfectly sound condition.

OVER 150,000 CUBIC FEET OF TIMBER IS STORED IN THESE FLATS; 5—HAULING GREENHEART LOGS ON CARS; 6—A GREENHEART CAMP SHOWING THE PRIMITIVE CHARACTER OF THE HOUSE. ALL SUCH TEMPORARY HOUSES ARE PUT UP IN A VERY SHORT TIME WITHOUT THE USE OF A SINGLE NAIL; 7—A LANDING PLACE ALONG THE RAILROAD WHERE GREENHEART LOGS ARE LOADED ON THE CARS TO BE SHIPPED TO THE TIMBER FLATS ON THE DEMERARA RIVER; 8—SQUARING A GREENHEART LOG IN THE FOREST. ALL LOGS ARE SQUARED IMMEDIATELY AFTER FELLING THE TREE. IT MUST NOT REMAIN IN THE FOREST FOR MORE THAN TWO OR THREE DAYS AFTER FELLING AND SQUARING, OR BORERS WILL WORK INTO THE SAPWOOD OF THE LOGS.

All the gates, piers, and jetties of the Liverpool docks and practically all the lock gates of Bridgewater canal (England) are of greenheart. It furnished material also for the fifty pairs of lock gates in the Manchester (England) ship canal. Greenheart was also supplied for harbor works at Rosario and Bahia Blanca in Argentina, and also at Coatzacoaleos in Mexico and at La Guaira in Venezuela. It was used extensively at Oban and in the new naval dock at Methil, both in Scotland. Indeed, H. W. Hunter, a well-known marine engineer, has asserted that, apart from its practically unlimited durability, greenheart has many advantages over steel for such purposes. It is, in fact, impossible to fix a limit to the durability of lock gates built of greenheart, the only element in their construction which might curtail their length of service being the iron bolts and other fastenings. These, however, can usually be renewed without serious difficulty. When the greenheart dock gates in the Mersey Harbor were removed, in order that the channel might be deepened and widened, the wood originally used in their construction was again employed in building the enlarged gates. Similarly, the wood in the gates of the Canada dock, built in 1856, was used again in its re-construction in 1894.

Nansen's Arctic ship *Fram*, and the South Polar discovery ship *Gauss*, of Antarctic fame, are planked with greenheart which withstood the grinding and shocks of ice without deterioration. The wood is used also for trestles, bridges, buildings, shipping platforms, staging, millwork, cellar flaps, flooring, wagons, carriage shafts, automobile spokes, belaying pins, tobacco pegs, turnery and for all purposes involving great wear and tear. The darker grades of greenheart resemble the wood of *lignum-vitae* (*Guaiaecum officinale* Linn), and are considered as an excellent substitute for the latter.

The total production of greenheart grows from year to year, but this increased output is obtained only by going farther back into the forest and by developing better means of transportation. In the early days of the industry the timber was obtained only along the rivers, and the average output was considerably smaller. The annual production of greenheart in British Guiana has now risen to more than 300,000 cubic feet. In ten years the amount of greenheart exported has markedly increased, and it is believed the export at the end of the next ten years will be more than double what it is at the present time. An ominously rapid advance of the logging operations toward the interior of the colony indicates that greenheart is not inexhaustible. The colonial authorities fully appreciate the necessity of increased effort to maintain a supply and to regulate the cutting so that a complete exhaustion will not be imminent. They have issued warnings to producers and grantees and have suggested improvements in existing methods of working and closer utilization.

Many efforts have already been made to find a wood for use in marine construction that will serve as a satisfactory substitute for greenheart, since the supply of the latter will soon be short of the demand. The ingenuity of a few timber merchants and architects is constantly being exercised to provide good serviceable wood for the true greenheart. These imitations or substitutes, are sometimes difficult to be distinguished from the genuine. The expert, however, is familiar with the gross and minute characters of the wood, which will be of service in determining whether the wood delivered is genuine or not. There are closely allied trees whose woods are coming into more general use, but the test of years has shown that they are far less serviceable. A most accurate knowledge of the structural characteristics of greenheart is imperatively necessary to be able to discriminate between the true and the inferior kinds, the timber of which, notwithstanding the close specific affinity of the trees themselves, is often found to be widely different in its adaptability to a particular work or in its resistance to the ravages of marine borers or other destructive animals.

The true greenheart shows in smooth transverse sections numerous small pores that are evenly distributed and filled with a greenish resinous substance known as tylosis, which is said to be poisonous. The pith rays are very narrow, indistinct, and the wood does not show any rings of growth which are so easily detected by means of a hand lens in the majority of woods. These more or less con-

spicuous features, with others of a more minute character, can be readily observed in a transverse section and will enable the expert to recognize true greenheart as distinct from every other kind of wood which may be offered as such.

A very close resemblance to the true greenheart is the wood of a British Guiana tree which is called washiba, and which is probably a species of *Tecoma*, a tree entirely unrelated to greenheart. Washiba wood resembles greenheart more completely than any other wood in South America. It can be easily recognized, however, by the fact that the pith rays of washiba are arranged in horizontal lines as seen on a smooth tangential surface. This wood is now being imported into the United States under the patented name of bethabara, and is used extensively in the manufacture of fishing rods.

Another wood that is occasionally recommended to take the place

of greenheart in marine construction is the bulletwood (*Mimusops globosa*), which is produced by one of the largest trees in South America. It is particularly abundant in Dutch Guiana, but is also very plentiful in Berbice, British Guiana. Bulletwood is very hard and heavy and possesses many properties which render greenheart so valuable. It cannot be recommended for piling and marine construction, because it is not proof against sea worms, and great care should be exercised not to include logs of this species when greenheart is specified. True bulletwood is one of the easiest woods to be recognized by means of a hand lens. On a smooth transverse surface can be seen numerous fine, short lines of small pores arranged in radial rows, and still more numerous, though less conspicuous, are the concentric lines of soft tissue which run at right angles to the indistinct pith rays.

Graves Analyzes National Issue

Henry S. Graves, forester of the United States, returned to Washington recently from field work which took him to the Pacific coast states, and to Arizona and New Mexico. While in the West he was in direct touch with many of the lumbermen in connection with the study of the lumber industry recently inaugurated by the Forest Service of the Department of Agriculture and by the Bureau of Foreign and Domestic Commerce of the Department of Commerce.

In speaking of his trip, Mr. Graves pointed out that his view of the present lumber situation, which is admittedly bad from the standpoint of business, is primarily from the angle of the consequences to the general public. "I recognize very clearly," says Mr. Graves, "that when a great industry, second in importance in the country, and the one which employs the largest number of men, reaches a condition of depression, the whole country suffers a loss. A part of this public loss can be definitely measured in dollars and cents. Another part of it cannot be so expressed, for it concerns the problem of actual existence of hundreds of thousands of individuals who are dependent for a livelihood directly or indirectly on this industry.

"Not only does the public lose through the consequences of an industrial depression, but there is a very definite loss from the standpoint of conservation of our lumber supply. Every operator must appreciate this when he is forced to waste large quantities of material because he cannot market it; yet the conditions are such that he must continue to operate to meet financial or moral obligation. In other words, he must keep up interest charges on his investment, or maintain his working organization to prevent suffering in the community which he had built up and which is dependent upon him. It is elementary that, when a business is not prosperous, it will be difficult to work out plans which must go hand in hand with such prosperity. To make forest resources go as far as possible with a minimum of waste, to continue and renew these resources, and to build up and make permanent the industries depending upon them, require that the business must be carried on at a profit. I have found that there are still many who do not appreciate this interrelation and interdependence of conservation and industry.

PROBLEMS OF THE LUMBER INDUSTRY

"As I see the problem, it has three general divisions:

"First, there are inherent problems in the handling of a natural resource under conditions resulting from private ownership, such as those leading to over-production, destructive competition, and forced timber cutting.

"Second, problems due to defects in the way the lumber business is handled, such as imprudent bonding, over-investment, and inadequate knowledge of costs and methods of distribution.

"Third, those problems which arise from a failure of the public and of the industry to get together in a spirit of co-operation, and in general a failure to recognize their mutual interests in attaining an end essential to the welfare of the industry and of the people as a whole.

THE GOVERNMENT'S INQUIRY

"In this connection, I wish to point out particularly that the present inquiry by the government is not undertaken with any inquisitorial attitude, but in a constructive spirit to find out and to bring forward for the benefit of the public and of the industry just what are the present conditions and the causes of the depression.

"The three points to be covered are: First, the economic problems from the point of view of the producer; second, the distribution, with a view to finding out ways to benefit both the producer and the consumer; and third, the extension of foreign trade. The bringing of these facts together cannot be otherwise than helpful to the industry, because the presentation of the whole field as a result of such study by an impartial public agency should result in a better relationship than now exists between the industry and the public."

LOCAL PROBLEMS

On being asked whether he had investigated specific problems on the national forests, Mr. Graves stated that among the important special questions which he had studied were the development of plans for the handling of the Olympic national monument in Washington and the Grand Canyon of Arizona. In general the principal aim of the field trip was to study how the forests may be made to serve the local public in the building up of their communities and industries. Co-operation in this field is already far advanced as is evidenced by the local support which is being given to the Forest Service in its work of fire protection and forest administration.

On being asked about the bad fire situation this year, Mr. Graves stated that in portions of the Northwest the seasonal conditions were just as bad as in 1910. "The only difference from 1910 lies in the fact that during the year just closed the Forest Service mastered the fire situation and kept the damage down to an insignificant amount. The organization was put to its greatest test and stood up under that test. It was definitely demonstrated this year that it is possible to protect the western forests from fire even in the worst years. In 1910 the Forest Service was unable to cope with the situation without large loss, primarily because the forests were not equipped with trails, telephones, and other improvements. While an enormous amount of work along this line remains to be done, nevertheless with the improvements already complete and the more experienced and efficient organization, the serious season just closed was passed after a hard fight with small damage to the public. Instances occurred outside of the national forests on private lands where the protective organization of the owners broke down and enormous damage resulted; in one or two instances the efforts of individual states were not successful, due to lack of effective organization. All these facts demonstrated the necessity for the closest co-operation between all agencies interested in timberlands and the need of full public support in order to provide for effective machinery to prevent forest fires. Altogether greater progress was made in the matter of handling fires during the current season than during any previous year."

Southern Traffic Developments

A test case of interest to all southern shippers of hardwood is that of Doran & Co., manufacturers and dealers of Cincinnati, versus the Nashville, Chattanooga & St. Louis Railway. A brief for the complainant has been filed with the Interstate Commerce Commission setting forth reasons why a through rate, plus a reasonable charge for re-consignment, should be allowed on lumber. Doran & Co. shipped five cars of hardwood lumber from Chattanooga to Cincinnati re-consigned to Toronto and London, Ontario. The carriers collected the sum of the local rates from Chattanooga to Cincinnati and from Cincinnati to the Ontario points. This rate is declared to be unreasonable as lumber should be considered one of the commodities entitled to the privilege of a through rate plus a reasonable charge for re-consignment.

Excepting walnut, cherry and cedar, a fourth section order has been issued providing that rates on all lumber from Alabama and Florida points to eastern cities may be established at two cents per hundred pounds higher than the rates concurrently in effect on yellow pine.

At the request of the Southern Cypress Manufacturers' Association of New Orleans, its case against Morgan's Louisiana and Texas Railroad and Steamship Company has been dismissed.

At the request of the complainants, the case of the Alexandria Coopersage Company versus the Louisiana Railway & Navigation Company has been dismissed.

After consideration by the commission, the case of the Meeds Lumber Company versus the Alabama Central Railway has been dismissed.

At the request of the complainant, the case of the Chestnut Lumber Company versus the Louisville & Nashville has been dismissed.

A new tariff effective December 1 cancels proposed increases on lumber on the Illinois Central and the Yazoo & Mississippi Valley to New Albany, Indiana, and allows for the dismissal of the investigation which was in progress in regard to the increases which were under suspension.

An important fourth section order has been issued this week providing a rate of twenty-six cents on mahogany in earload lots from Gulf ports to Grand Rapids. The minimum weight is placed at 30,000 pounds. This rate is intended to apply to mahogany from Latin America. Mahogany from Europe, Asia, Africa, Australia, New Zealand and the Philippines is excluded. The rate applies only on imported mahogany and may not be applied to shipments from Gulf ports proper.

A suit has been entered in the supreme court of the United States by the Export and Import Lumber Company versus the Port Banga Lumber Company. Each company operates in the Philippines.

Exports of lumber through Gulfport, Miss., showed some increase during October. This was due entirely to increased demand from South and Central America and the islands. Not a single cargo went to Europe. Total shipments amounted to 7,819,000 feet as compared to 6,030,400 feet in September.

An unusually large number of complaints from lumber companies were received last week at the Interstate Commerce Commission. Among them were:

C. C. Mengel & Bro. Company, Louisville, versus the Baltimore & Ohio, et al. It is stated that an unreasonable rate is being collected from Louisville to Philadelphia on cedar logs. A rate of twenty-eight cents is charged on cedar and twenty-three cents on mahogany. It is claimed that the two varieties of logs should take the same rate. Reparation on past shipments is asked.

J. V. Stimson Hardwood Lumber Company of Memphis, Tenn., and Mounds, Ark., versus Chicago, Rock Island & Pacific. It is claimed that unreasonable charges were made on hardwood logs from various points to Memphis, due to tariff requirements. The commission is asked to stop these requirements, adjust rates and award reparation.

Florida Cypress Company, Pensacola, versus Louisville & Nash-

ville. Unjust rates on cypress from Pensacola to various destinations. Reparation asked.

Ohio Valley Tie Company, Louisville, versus Louisville & Nashville. It is charged that unreasonable rates are being collected on red oak ties from Kentucky points to Indianapolis. Reparation is asked. A separate complaint charges unreasonable rates on ties from Kentucky points to Erie, Pa. Through rates and reparation are asked.

American Column and Lumber Company, St. Albans, W. Va., versus Chesapeake & Ohio. Overcharges alleged.

Palmer & Semans Lumber Company, Uniontown, Pa., versus Baltimore & Ohio. Unreasonable rates are alleged.

North State Lumber Company, Greensboro, N. C., versus Southern Railway et al, unreasonable and discriminatory rate to New York. Reparation asked.

T. B. Stone Lumber Company, Cincinnati, versus Illinois Central, overcharge. Reparation asked.

Beekman Lumber Company, Kansas City, versus Tremont & Gulf et al, unjust rate. Reparation asked.

Fullerton Lumber Company, Minneapolis, versus Chicago, Rock Island & Pacific. Unreasonable rate on cedar posts to Michigan points claimed.

R. B. Homer Lumber Company, Baltimore, versus Southern Railway et al. Unreasonable rate on lumber between Blacksburg, S. C., and Jersey City claimed. Reparation asked.

Union Lumber Company, Houston, Tex., versus Gulf, Colorado & Santa Fe. Lumber rates from Milvid, Tex., to Humansville, Mo., declared unreasonable. Reparation asked.

In the case of R. J. Darnell, Inc., of Memphis, versus the Yazoo & Mississippi Valley, a reply brief has been submitted by the railroad. It is stated that the order of the Interstate Commerce Commission included "branch line points." Leland, Miss., is on a branch of the Southern Railway which runs from Percy to Richey. Consequently as Leland is north of the junction of the Southern and the Yazoo & Mississippi Valley, a rate of eleven cents on gum lumber to New Orleans is held to be authorized. The railroad claims that the act to regulate commerce has not been violated and that a fair interpretation of the ruling of the commission has been made.

Lower rates than to intermediate points have been allowed on thin lumber manufactured from native woods from Augusta, Georgia, to Mississippi and Ohio river crossings.

An oral argument of the case of the Wisconsin and Arkansas Lumber Company versus the St. Louis, Iron Mountain & Southern will be heard in Washington by the commission, December 12.

Oral arguments of the case of the Butters' Lumber Company versus the Atlantic Coast Line and the Mullens Lumber Company versus the Southern Railroad will be heard December 9.

Postponement of the lumber hearings to be held in Memphis and Birmingham has been granted by the Interstate Commerce Commission. John R. Walker, representing several lumber companies together with counsel for the carriers joined in asking for this postponement. The hearings are to be on the general lumber rate advances, scheduled to go into effect October 1 but which are under suspension. The hearings were set for December 14 and December 16 in Birmingham and Memphis respectively. This did not allow the required time to get together the large amount of data that has to be used, as so many of the rate structures are involved. The hearings have been reset as follows: Memphis, January 13; Birmingham, January 18; Louisville, January 19.

An important case to the hardwood industry is that of the Himmelberger-Harrison Lumber Company of Cape Girardeau, Mo., versus the Frisco lines. The hearing is to be held in St. Louis and it is hoped that the arguments advanced there will be the wedge opening the way for a general reduction of hardwood rates from southern Missouri to Thebes and beyond. This is a test case and attacks the rate from Morehouse, Mo., where the mills of the Himmelberger-Harrison company are located, to the Thebes gateway and points

beyond. John R. Walker of Washington, will appear for the Himmelerger-Harrison company.

Hearings have been announced by the commission as follows: December 2-3, Portland, Ore., before Examiner Wood: Eastern Oregon Lumber Producers' Association versus Chicago, Burlington & Quincy, et al.; December 8, Atlanta, before Examiner Watkins: Byrd-Matthews Lumber Company, et al, versus the Gainesville & Northwestern; December 12, Birmingham, Ala., before Examiner Watkins: Holland-Blow Stave Company versus Illinois Central; Standard Lumber Company versus Atlanta, Birmingham & Atlantic; Chickasaw Lumber Company versus Louisville & Nashville; Scotch Lumber Company versus Michigan Central; December 14, Chicago, before Examiner Butler: Indiana Silo Company versus Pittsburgh, Cincinnati, Chicago & St. Louis.

There seems to be a good chance of winning the case before the Interstate Commerce Commission against the increase in the rate on club turned spokes on central western lines. This case was argued in Washington last week. The complainants are the Spoke Manufacturers' Association of Poplar Bluff, Mo., and the Hickory Products Association of Moline, Ill. In a former similar case the commission ordered the same rates used as applying to general lumber. The same adjustment is sought in this case at the points not involved in the former case. The railroads failed to show points of differentiation in the present suit.

The 1915 edition of the General Lumber Tariff, issued by the Lumbermen's Bureau of Washington, is in the hands of the printer. It will be ready for distribution before Christmas. It contains the rates between all lumber producing and consuming points.

Shipbuilding and Lumber

Among the interesting news items coming from Washington recently was one stating that during the month of October there were 131 ships added to the United States merchant marine. Something of this kind was to be expected because the cutting away of certain restrictions around our navigation laws makes it practical for foreign built ships to enter under the American flag. It is not this which is the startling feature of the news, however, but the fact that of these 131 ships an even 100 of them were the product of the American ship yards and of these ninety-two were of wooden construction and eight of metal.

It is these ninety-two wooden ships, turned out by our ship yards in one month, that constitute the center of interest in this item for the lumber fraternity. The ships were not of so large type or heavy tonnage as some of those entered from other countries; neither were they all ocean going vessels. The Atlantic and the gulf ports contributed fifty-seven of the ships, the Pacific coast eight, the Great Lakes twenty-two, and western rivers thirteen. So, part of these were comparatively small, being river steamers, but even so it illustrates very graphically the activity in American ship yards and is apparently but the beginning of a busy season that will continue through the next year or two at least.

This shipbuilding is calling for a heavy volume of lumber, much of it being special stock out to order. The work of the ship yards should be attracting more general attention in the lumber trade than it is. There are people who might profit from it directly who seem to consider it not worth looking into. Some interior hardwood people talked to on this subject show a disposition to pass it off with the statement that it is a trade they have no direct connection with; consequently while there is evidence that it is doing good and helping out in a way, they do not take enough interest to make inquiries and to see what the possibilities are for developing trade with shipbuilding concerns.

Presumably, most of these ships are freighters and they do not carry the elaboration in interior trim and cabinet work that is found on the big ocean passenger ships. However, there must be cabin work as well as rough decking and compartment work, and this is interesting, both directly and indirectly, to everybody in the hardwood trade. Extensive shipbuilding means a more extensive use of wood in millwork for equipping cabins; it means paneling, some in solid wood and some in veneer, and finally, it means more in the furniture line, which also increases the volume of consumption in hardwood.

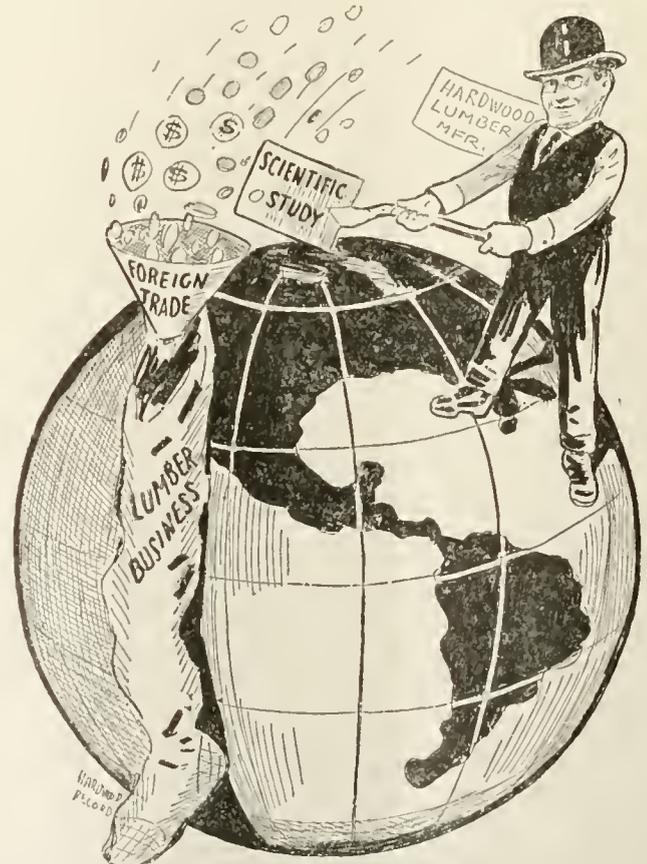

Indeed there is enough to interest every man in the hardwood business in this increasing activity among the ship yards, and if it is practical for those in the interior to ship hardwood abroad it should be practical for them to get in touch and supply the needs of ship yards and of people who get out the millwork and furniture for steamship equipment. The shipbuilding trade is helping the hardwood business right now, and by the manifestation of a little more active interest in the subject, many in the hardwood trade might reap direct instead of indirect benefits from it.

Statistics compiled by the United States Forest Service show that the annual use of wood for boat and shipbuilding in this country amounts to approximately 200,000,000 feet. Those employed in largest quantity are yellow pine, oak and Douglas fir, but about forty other woods find a place in this industry, and most of them are hardwoods, including maple, birch, larch, chestnut, red gum, tupelo, yellow poplar, ash, locust, cottonwood, basswood, elm and even such scarce woods as cherry and black walnut.

Forbach, Germany, is said to have the most profitable town forest known: it yields an annual net gain of \$12.14 an acre.

The state school of forestry at Bottineau, N. D., announces that it will have 1,000,000 trees for distribution to the citizens of the state during 1915.

The town forest of Baden-Baden, Germany, yields an annual profit of \$5.25 per acre, or a total net profit of nearly \$37,500.

A CHANCE FOR THE AMERICAN LUMBER MANUFACTURER TO FILL HIS CHRISTMAS STOCKING

What Lumber Means to Chicago

Editor's Note

The following is an address delivered by Ernest H. Burgess, assistant secretary of the Herman H. Hettler Lumber Company of Chicago, before a recent meeting of the membership bureau of the local Chamber of Commerce. It contains some new and pointed arguments showing the unfairness of the present campaign of wood substitute manufacturers.

I wonder how many of you, not lumbermen, have any idea of the vastness of this industry? Are you impressed with its extensiveness when you contemplate the many and diversified uses of lumber? Just to mention a few of these at random: the houses you live in and most of their furnishings, like furniture, trim, sash, doors, etc.; the passenger coaches of steam, electric and street railways; freight cars; railroad ties; planking for bridges and roadways; crating and boxing lumber; the chairs you are sitting on; the tables you eat from; matches; your daily papers are printed on pulp wood; etc. Summed up: Lumber supplies the natural needs of man more than any other substance, excepting the soil.

Chicago is preëminently the greatest lumber market of the world and is destined to remain so. Last year there was received in this market a total of 2,504,434,000 feet of lumber, which is equivalent to a total tonnage of 8,413,302,000 pounds. These figures may not appeal to the non-lumbermen so I will present this comparatively.

Last year's grain receipts in this market were as follows:

Wheat	50,372,000 bushels
Corn	127,773,000 bushels
Oats	124,405,000 bushels

equivalent to a total tonnage of 14,158,568,000 pounds. The total lumber tonnage for this same period was more than any one of these three staple items of grain and fifty-nine and one-half per cent of the total grain tonnage. Of the total lumber tonnage railroad companies received all but eight and two-thirds per cent, which represents receipts by water. I will not bore you with further statistics to prove above statement, as I consider such statistics are of value only to lumbermen. You will, however, be interested to learn why Chicago has this distinction—primarily because of its geographical location. Here are assembled the lumber products of the entire United States and Canada, also of some foreign lands. From Michigan, Wisconsin, Minnesota and Canada the following soft woods are procured: White pine, Norway pine, spruce, hemlock, American larch, balsam of Gilead, etc.; and the following hardwoods: Maple, beech, birch, ash, elm, basswood and oak.

From Pacific coast states we receive: Fir, red cedar, spruce, western pine, sugar pine, redwood, etc.

From the northwestern states we receive: Idaho white pine, western hemlock and western pine.

From southern states, principally from Mississippi, Georgia, Alabama, Louisiana, Arkansas and Texas we receive yellow or southern pine. From some of these states and Tennessee, Kentucky, West Virginia and Ohio the following hardwoods are procurable: Poplar, oak, ash, cypress, etc.

From foreign countries, like Africa, South America, there are brought to this market mahogany logs, etc., which are here worked into veneers and high class finish.

The lumber yards of this city, for mental convenience, can be divided into two classes: The pine yards and the hardwood yards. Few of the pine yards make any effort or attempt to carry a stock or assortment of hardwood lumber, and vice versa. The hardwood lumber yards specialize in their particular line. Crandall & Brown, of which firm our worthy chairman is a member, handle hardwoods exclusively and specialize in cypress.

To give non-lumbermen some idea how a wholesale and retail lumber yard is operated in Chicago, I will present a little data of the Herman H. Hettler Lumber Company's business. There are other lumber yards operated practically along the same lines but I am better informed and can speak more intelligently of the company I am associated with.

Our office is located at 2601 Elston avenue, on the northwest side, near Diversey boulevard and north branch of Chicago river. Our

lumber yard covers an area of eighteen and one-half acres. Our stocks of lumber vary from 28,000,000 to 35,000,000 feet. In conjunction with our lumber yard we operate a planing mill, equipped with modern type of machinery. We can furnish dressed lumber to suit the individual needs of each customer. We also operate a hardwood flooring plant and all the paraphernalia which goes with this, like dry kilns, etc.

SHIPPING FACILITIES

Our yard is located on the north branch of Chicago river and on the Wisconsin division of Chicago & Northwestern Railroad. Practically all of the northern products of lumber are received by boat during season of navigation, for which reason we have a large river frontage. With few exceptions our own boats carry this lumber. The Chicago & Northwestern Railroad performs switching service during the night so as not to interfere with either the loading or unloading of cars during our working hours.

For local delivery we have motor trucks and horses. Large, heavy loads and long hauls are combinations especially attractive for our motor truck service.

SALESMANSHIP

Just a few words about the salesmanship of lumber. I have long ago learned that Providence has created certain woods for certain purposes. The successful lumber salesman is the one who has studied lumber business from this angle. He should know the peculiarities of each kind of lumber and this knowledge should enable him to give wholesome and profitable advice to the consumer. Lumber exposed to the elements must be of lasting quality to withstand the elements and ravages of time. Lumber placed in the ground or next to the soil must not be susceptible to moisture. Lumber used for planking or floors on which there is constant and heavy traffic must have strength and durability.

The following article which appeared in September 20 issue of *Construction News* emphasizes this point:

It is unfortunate that so little attention is given to educating the users of lumber as to the best wood intended for the respective kinds of work. A shoe dealer would not sell a laborer a patent leather light-soled shoe for work in the swamps, or a heavy boot to use on a dance floor. God in His wisdom gave us the forests to use wisely and judiciously. When, therefore, you sell a quick-decaying wood for exposed work, you are helping to mold public opinion and make the buyer believe that lumber is no good for a durable job and further lead him to the straight road to try something other than lumber. We know that proper lumber of a proper grade will withstand the ravages of time as will nothing else at an equal or higher price. We point with admiration and reverence to old homesteads of wood that have stood for fifty to seventy-five years and are still inhabited. Have you heard of a modern metal sheathing that will stand for ten years without paint every six months, a plaster or composition board that can beat a seven-eighths-inch wood ceiling for wear, a cement floor in a basement that will not be cracked, concave or convex in ten years? A floor on cedar or white oak sleepers with proper ventilation will last twenty-five years. A shingle roof will last thirty-five years in the country or sixteen to twenty years in the city. Show me a composition that will hold up one-half as long. Put your galvanized bucket against the old oaken bucket or cedar bucket. We dote on antique furniture: it was built to wear and we cherish it. How long will steel cases last after they get dented and the lacquer off? Would our descendants cherish it? Metal furniture is finished to imitate wood. How complimentary!

COST OF LUMBER

There is a general impression among non-lumbermen that lumber is very scarce and, therefore, high in price. Just the contrary conditions exist. Lumber is plentiful (and this applies to all kinds, even soft cork white pine, which ever and again is referred to as "now almost extinct," and prices are reasonable. These erroneous statements are being circulated by manufacturers of other materials which are hoped will eventually replace lumber. A brick concern recently published a booklet from which I quote the following:

Millions of acres that were once the source of supply of cheap lumber are

now farms. Through lack of scientific forestry vast forests have been cleared, without heed for the future, until today our sources of timber supply are limited. According to government statistics, the general increase in the cost of lumber during the past thirty-five years has averaged 100 per cent every three years.

Let us assume for the sake of argument that this is a true statement and that the cost of lumber has increased 100 per cent every three years for the period mentioned. Supposing at the beginning of that period the initial cost is placed at \$10 per thousand feet. At the end of thirty-three years at the above ratio of increased cost, it would be selling for \$20,480 per thousand feet or just a trifle over \$20 per lumber foot. The statement is not only untrue but positively ridiculous, not even worthy of serious consideration.

ECONOMY AT POINT OF MANUFACTURE

Lumber manufacturers are often criticized for their wasteful habits at mill manufacturing points. If there were the proper co-operation between the United States Government, its Department of Agriculture, its Forest Reserve Commission, its Interstate Commerce Commission, the railroads with transportation companies and the lumber manufacturers, much of this seeming waste could be eliminated. Perhaps few of you gentlemen are aware of the fact that the freight rate on lumber is the same whether shipment consists of the highest grades or high-priced lumber or of the lowest grades or cheap lumber.

What if the railroad companies through their classification bureau assessed lumber freight rates as follows:

A certain rate for dressed lumber of the higher grades which provide interior finish, trim, partition, wainscoting, ceiling, etc.

A lower rate for the rough product of medium-priced lumber and a still lower rate for the offal suitable for fuel wood. If this were done many of the cheaper and poorer grades could be shipped to far-away markets instead of being consumed in the burner at the mill or wasted.

I can assure you that at our Chicago yard and plant there is very little waste because defective pieces of lumber are cut into shorter lengths for pail and tub stock, also for short length wainscoting, beveled siding, etc. In the manufacture of barrel heads many short pieces otherwise useless and worthless are utilized. The offal is disposed of for kindling wood, shavings and sawdust. In European countries, and I refer particularly to France and Germany, there is less waste at source of manufacture than in this country, because the finished product need not be shipped there the great distances that it must in this country. Again, as a tree is felled, it is stripped of its branches and its bark. Branches of the thickness of a man's wrist or thumb are gathered and bundled according to size. Twigs are also gathered and bundled. The leaves are gathered and packed; the bark is removed. There is absolutely no waste because each of these items is utilized for some purpose. Such a thing is impossible in this country so long as there is no consuming market in the immediate vicinity of our great forests. Our freight rates make it prohibitive to ship these items any great distance.

So much for the lumber business in general. The balance of time allotted me I want to devote to a question of vital importance not only to lumbermen but to the entire city of Chicago, because its solution affects the whole United States, namely:

EXTENDING CHICAGO FIRE LIMITS

This is merely another attempt of brick, concrete, cement and kindred manufacturers to secure local control of all building operations to the exclusion of lumber and kindred forest products. In the *Manufacturers' News* of September 24, issued in the interest of the Illinois Manufacturers' Association, there appeared an article by T. R. Waddell, secretary of the committee on publicity and education, which committee organized fire prevention day, from which I quote:

Extend the fire limits of Chicago.

Make the city safer, more beautiful, more sanitary and more enduring in the restricted area.

Build all dwellings and apartments and business structures of brick, concrete, stone or other permanent material, so they will last for generations.

The proposition to extend the fire zone was revived last spring in the city council.

Arguments against the permanent class of buildings simmer down chiefly to the single one that they are too expensive. The principal objection urged to the use of non-combustible material for dwellings is the claim that the cost is prohibitive for a man of small means.

Figures were secured on dwellings actually constructed, and it was found that the cost of a brick building with non-combustible roof was only 6 per cent higher than frame for buildings costing less than \$2,000, while for concrete with non-combustible roof the cost was a small fraction less.

It was argued that the lower cost of maintenance and insurance, the greater durability and the fact that they were warmer in winter and cooler in summer more than outbalance the slight increase in cost, to say nothing of the reduction of the conflagration hazard involved in the abolition of shingle roofs and exterior frame construction.

I am obliged to contradict these cost statements by figures which last January were submitted before our city council, and I will take just a little time to quote the following comparative statement:

These figures or estimates were secured from reputable local contractors who were then and are now still engaged in the contracting business.

On exhibit "A" six estimates were secured from as many contractors. The average bid on the:

Brick house was.....	\$2,133.17
Frame house.....	1,680.17

Difference\$ 453.00 In favor of frame house, or equal to 27%.

On exhibit "B" four estimates were secured from as many contractors. The average cost of:

Brick house was....	\$2,389.00
Frame house.....	1,887.25

Difference\$ 501.75 In favor of frame house, or equal to 26½%.

On exhibit "C" five estimates were secured from as many contractors. The average cost for:

Brick house was....	\$3,058.20
Frame house.....	2,383.50

Difference\$ 674.40 In favor of frame house, or equal to 28%.

On exhibit "D" four estimates were secured from as many contractors. The average cost of:

Brick house was....	\$3,639.75
Frame house.....	2,939.25

Difference\$ 700.50 In favor of frame house, or equal to 24%.

Compare a saving of 27 per cent on the first house, 26½ per cent on the second house, 28 per cent on the third house and 24 per cent on the fourth house with the 6 per cent difference in cost statement referred to in Mr. Waddell's article.

In this connection I wish to inform you that a committee of local lumbermen is now procuring comparative estimates on buildings under construction, these estimates to cover frame houses, brick houses and stucco houses. With your permission at some later date I will submit those figures which were not available at this time.

Apparently under the guise of educating the public, but obviously to secure spectacular advertisement, local brick manufacturers and allied interests of non-combustible material on fire prevention day, October 9 last, staged on lake front the timely melodrama of brick vs. lumber. The principal characters in this drama were a brick cottage and a frame cottage. These puppets had to suffer the humiliation of being consumed by fire in order to impress the audience and mold the opinion of the public to the thought that by extending the fire limits and by building homes of brick and non-combustible material conflagration is prevented, hence the solicitous warning of the brick manufacturers, "Don't build to burn."

The *Manufacturers' News*, issue of October 15 last, reported this drama as follows:

Combustion in the frame house broke the windows before the brick house showed any signs of damage. Then, to be perfectly fair, policemen klicked in the door of the brick structure so it would have a draft also. "I think it was rather more than fair," said a brick manufacturer afterward.

Robbed of the spectacular and theatrical, this episode merely gives you some idea how active local brick manufacturers and allied interests are to secure general control of the building operations

of this city to the exclusion of lumber. Is it their object to develop a finer type of citizenship for this great city of ours, to pave the way for the humble wage-earner to become a home-owner and that more rapidly than he is capable of at his present stride? Why this antagonism to lumber interests?

At a meeting of the building committee of the city council, held March 5, 1912, a prominent official of the fire department made a statement that with the water mains enlarged and high water pressure and with the splendid fire department then at his command it would make no difference whether buildings were made of wood or brick construction, he could then take care of any fire.

This statement is practically also borne out and corroborated by a representative of a prominent fire insurance agency of this city, one of the largest in the world. From his report I quote:

In the question of desirability from a fire insurance standpoint, as to whether there is any real difference in loss ratio between a frame dwelling with a shingle roof and a brick dwelling with a gravel roof, if statistics could be obtained, they would prove that there is no radical difference in the loss ratio of each to the premiums of its class. A brick dwelling, after a fire, contains salvage to the insurance companies in the walls, but because of the numerous windows and door openings, it is as serious in exposure to its neighbors as a frame dwelling. Naturally a frame dwelling would have a higher loss ratio on account of the difference between frame and brick as far as salvage goes, but from an insurance standpoint, it is immaterial which class of construction is used.

Conflagrations are no respecters of construction. Total losses have occurred in reinforced concrete buildings occupied only for office purposes; as an illustration, the concrete office of the Emerson-Brantingham Company, at Rockford, built for and occupied for office purposes. Enough combustibility in the furniture, fixtures and stationery caused a complete loss to construction. It would be as easy to have conflagrations start through a brick dwelling house district as it would through a frame dwelling house district. When sufficient heat has been generated plus the velocity of wind, fire will sweep through any form and character of construction, rendering same practically a total loss from every standpoint. The question of frame construction in the outlying parts of Chicago or Cook county is, therefore, no more serious a menace from a fire standpoint than if the same were constructed of brick, especially as the brick would be full of window and door openings and after all is but a frame construction with a brick covering.

It is not possible to obtain statistics that show enough results on the dwelling house business. Ordinarily, a frame dwelling constructed these days, is not expensive and the loss on same, if total, as compared with the premium charged for it, is a far less ratio of loss to the insurance companies than a four or six-story double apartment building which proves, after a fire, to be a very heavy loss.

It would seem to me, as if on account of the smaller values in the ordinary frame dwelling as compared with the increased values in brick dwellings and especially apartment buildings which must be classified as a dwelling house these days, that figures, if they could be obtained, would prove that a frame dwelling house business at the rates charged, would show a higher rate of profit to the insurance companies than it will on the balance of the so-called preferred brick dwelling and apartment building classification.

As it applies to the initial cost of a home and particularly the difference in cost between a brick and frame house, I quote the following letter from the *Chicago Daily News*, November 3, 1914, published under heading, "Views on Many Topics":

Every year we set aside one day that we call fire prevention day. This year two buildings were erected in Grant Park, one of frame, the other of brick. The object of this was to show which would burn down more rapidly. But whoever saw a whole row of frame buildings burn down in the outlying districts of Chicago in the last ten or fifteen years since there has been an ordinance that a building must be one foot from one lot line and three feet from the other lot line, giving four feet of space between two houses?

A \$3,000 house is usually bought by a workingman, whose income is \$1,000 a year or less. He will buy on payments of about \$25 a month. This same \$3,000 house in brick would cost 25 per cent more. Therefore, his payments would be about \$32 a month. Some people may say: "Oh, that is only \$7 a month more. He can meet that just as easily." I know from experience that he cannot, for I have seen many of these men's wives go out to work and wait eagerly for their children to reach working age in order to help meet these \$25 payments.

Some years ago Sweden sent a representative to America to find why Swedish people had left their homes. On returning he said that the fact that a man can buy a home on "time" and be his "own landlord" was one reason.

Why deprive the man of the small "frame shack" when he cannot afford a brick house?

You must all admit that the best type of citizenship is developed from the home owner. To the man of small means and slight income

the initial expense in the purchase of a home is of vital importance. It has often been my privilege to discuss the matters of cost and terms with men and women about to let a contract for a home. Consider the vast areas of real estate within the limits of this great city that are being transformed from truck farms to residential lots. While I am an ardent admirer of Nature, I certainly prefer to see this change, and from personal observation I have seen acre after acre evolve from truck farm to a community of home owners. Do you realize that to these people a difference of a few hundred dollars—yes, even \$50—in the cost of a house too often stands between them and the possession of a home? I have discussed only the cost. As regards the permanency, the beauty, the safety and the sanitation of frame houses, I leave these to your better judgments.

Supposing sprinkler manufacturers, to expand their business, should urge our city council to pass an ordinance making it compulsory to install automatic sprinklers in your homes, offices, churches, etc., just to reduce the fire hazard of this city. Would not the cost of installation of automatic sprinklers have to be considered in proportion to the saving of insurance premium? Is the fire hazard here so great that the quiet beauty of our homes, etc., must be invaded by these unsightly sprinklers whose domain of usefulness is confined to department stores, factories, storehouses, etc.? The same is applicable to fire escapes.

The tactics of local brick, cement, stucco, etc., manufacturers are unethical. By legislation they are trying to secure business prestige which along legitimate competitive lines would be denied them. Do lumbermen fear their competition? No. Do lumbermen try to persuade or induce a home-builder to contract for a frame house when his means permit the luxury of a brick house? Emphatically, no. Now what is to be done to solve this problem which is cropping up in all directions, in Cleveland, Buffalo, Milwaukee, Seattle, Baltimore, Chicago, etc. Fortunately for Chicago lumbermen, this city of ours has a most efficient organization whose influence is far-reaching and salutary in public, commercial and municipal affairs. I am referring to our Chicago Association of Commerce.

I want to impress this on all of you, and particularly the lumbermen who are members and yet misunderstand the wonderful work of this association. I may aptly term their committee appointments to handle and consider this vital question of extending the Chicago fire limits a "round table" conference. At this "tribunal" the subject can be discussed pro and con from the various angles and viewpoints of the insurance interests; the brick, cement and allied interests; the lumber interests and interests of the outside public which after all is the most important to consider, because the enhancement of citizenship depends on it. The Chicago Association of Commerce is neither fostering nor sponsoring this movement; merely assisting these various interests in solving this important question. What has the Chicago Association of Commerce done? It has placed at the disposal of Chairman Dunn a committee selected from and representing these various interests. The work of this committee has been aggressive and thorough and if it has not succeeded in solving this question to the entire satisfaction of each committeeman or the interests he represents, I want to comfort the committee with former achievements of the Chicago Association of Commerce. My personal experience with the association has taught me that it is ever-ready to consider the report of the objecting minority. The policy of the Chicago Association of Commerce is so broad-gauged that it can solve a perplexing question like this one and still satisfy all interests because it is so co-operative in spirit. I personally wish Chairman Dunn and his committee every success and if some features of this momentous question have not been satisfactorily solved, I can assure Mr. Dunn that each interest stands ready to assist him and his committee. Gentlemen, it is in this association "where all to each would lend a helpful hand."

Wireless telegraphy is being used in Canada in reporting on forest fires.

The best excelsior is made from basswood, or linden. Aspen and cottonwood, however, supply nearly half of the total amount manufactured.

Lead Pencils and Penholders

It seems that undue importance has been attached to the recent announcement that the cutters of red cedar wood for pencils in Tennessee have quit work because the pencil slats, which are the partly-manufactured material, cannot now be shipped to Germany where the pencils are made. It is doubtless a fact that the Tennessee cedar cutters have quit making pencil slats; but that does not imply that America will experience a scarcity of lead pencils. Nothing in the nature of a pencil famine need be looked for. This country has not depended to any great extent on Germany and Austria for pencils, as some persons have supposed; and at this early period of the war steps have already been taken to make in America the line of pencils which have been coming from Germany.

It is reported that a large factory is to be located in Toledo, O., owned by Americans, to make the Faber pencil, or a grade corresponding to it. It has been made in Germany up to the present time; but now its American distributors have decided to build their own plant, and have selected Toledo as the place. It is said that the factory will cost \$200,000 and will employ 200 people.

Leaving the proposed factory out of consideration, no distress would be caused in this country by cutting off the pencil imports from Germany. The United States is able to take care of itself in that respect. The German and Austrian imports of this article have been greatly overestimated in popular opinion, as a preliminary investigation will amply show. One of the first unexpected facts to be brought out by such an investigation is that England furnishes more of our lead pencil imports than Germany and Austria combined, and it is further shown that thirteen countries, instead of one, ship pencils to the United States, though very small quantities come from some of them, as the following table of lead pencil imports in 1913 shows:

Country	Value of lead pencil imports
England	\$295,143
Germany	254,980
France	2,929
Austria	722
Netherlands	387
Canada	316
Scotland	314
Japan	48
Italy	38
Switzerland	25
Turkey in Asia	8
Hongkong	4
Denmark	3
Total	\$594,917

In the foregoing table, and in the following statistics in this article, crayons, if made of graphite or plumbago, are included with pencils.

THE AMERICAN SUPPLY

The United States exports more pencils than it imports. Such exports are over and above what its own people use at home. The following figures show the export of lead pencils from this country last year:

Destination	Value of lead pencils exported
North America	\$336,410
Europe	173,202
South America	48,910
Oceania	43,657
Asia	21,956
Africa	1,413
Total	\$625,548

These pencils go to nearly every country in the world with which the United States has any trade. The largest purchaser is England, Canada is second, Mexico third, and Cuba fourth.

Eleven establishments in the United States make lead pencils. One is in Georgia, one in Iowa, one in Massachusetts, two in New York,

two in Pennsylvania, and four in New Jersey. These establishments rate in size as follows: One turns out a product of less than \$5,000 a year; two have a product exceeding \$5,000 and less than \$20,000; two produce more than \$20,000 and less than \$100,000; two over \$100,000 and less than \$1,000,000; and four exceed \$1,000,000 output.

There are 4,134 wage earners making pencils in the United States. This does not include those who cut the wood in the forest and dig the graphite. The invested capital is \$7,867,247; the expense \$6,804,058 per year; and the total product is worth \$7,378,744.

It may be noted that the output is stated in value, not in pencils. It would be difficult to determine the actual number of pencils made in a year, because crayons and pencils are listed together. Estimates of the number are published from time to time, as stray items of news, but such estimates do not appear to be founded on reliable statistics. The figures which the government collects to show exports, imports and manufactures all are based on value and give no information regarding the actual number of pencils produced. An estimate, which is perhaps as nearly right as any, places the production of lead pencils in the United States at 220,000,000 a year.

The principal pencil wood is southern red cedar, but several others are used. A wood of dark color is wanted, and it must polish smooth, whittle easily, and in first class pencils a pleasing cedar odor is expected. Many attempts have been made, some of which have been fairly successful, to color woods artificially for the pencil makers; but no artificial product has yet been devised to equal, in all respects, the heartwood of mature southern red cedar.

PENHOLDERS

Penholders are not classed as lead pencils, and have no right to be so classed; yet they are pretty closely related so far as manufacturing is concerned. In some factories the penholder is a by-product of the pencil. Wood may not be satisfactory for a pencil, yet suitable for a penholder. This is particularly true of the sapwood of red cedar. The maker of high grade pencils will not use it, but the penholder maker asks for nothing better.

It is probable, however, that most penholders never see a pencil factory. They are made of woods which do not go to pencil makers, such as basswood and white pine. In addition to the enormous numbers of penholders used at home, we export them to the value of \$74,508 a year to practically every country in the world. England is the largest buyer of these penholders, Canada next, Argentina third, Mexico fourth. The number exported last year amounted to 11,221,056.

New Specifications for Hickory Handles

Through new specifications for ax, sledge, adz, pick and other hickory handles, the Panama canal authorities have recently purchased large quantities of this class of material for one-fourth less than formerly paid, and at the same time are getting just as serviceable stock.

The War Department and the Navy Department, as well as the Panama Canal Commission, have adopted these specifications, which were prepared by the Forest Service primarily for the use of the various branches of the federal government. Subsequently, however, they have been approved by the trade, both manufacturers and dealers, and adopted by several of the leading railroads.

The new rules are the result of a long study of the subject, covering exhaustive strength tests, investigations of the growth of hickory in the woods, processes of manufacture and market conditions. Under the new specifications handles are selected according to weight, as influenced by the density of the wood, and they now include material which may be either partly or wholly of heartwood, known generally as red hickory. Red hickory was formerly discriminated against in commercial grading, but it is now accepted, since it has been found that weight for weight it is just as serviceable as the white hickory. Handles which contain small sound knots or bird pecks, so located as not to affect the strength, are also accepted.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 825—An Opportunity for Profitable Investment

HARDWOOD RECORD recently received the appended letter which is published herewith because it seems to offer an excellent opportunity for some one to make some money. We believe that by stimulating interest in legitimate investments the situation might be changed for the better.—EDITOR.

Philadelphia, Pa., November 16.—Editor HARDWOOD RECORD: Won't you please be kind enough to make mention in your columns of the fact that there is a planing mill at Reading, Pa., belonging to the late B. F. Sbeeder Est., which can be bought for about \$15,000 and which is well situated on a nice piece of ground and has a first class new brick building and outbuildings and is thoroughly equipped with modern and new machinery? This is one of the best propositions I know of for any planing mill man who desires to go into that business and is an excellent opportunity.

It would not require a great deal of financial backing, as there are mortgages on the building at the present time, which are in good hands and which would not be called in at once. Any party with responsibility and a certain amount of financial backing could handle this matter to good advantage, as we consider it one of the best opportunities that we know of at this time.

B 826—Wants to Sell White Oak Flitches

Charleston, Miss., November 14.—Editor HARDWOOD RECORD: Will you please advise by return mail the names of firms who purchase white oak flitches for manufacturing veneers?

The company writing this letter is in position to turn out a very high-grade line of flitches. Interested firms should address this office.—EDITOR.

B 827—Wants to Buy Large Quantities of Oak Ties

The following is a personal letter addressed to the editor of HARDWOOD RECORD by a friend in Port Arthur, Can. HARDWOOD RECORD does not know the gentleman referred to, but knows that the medium through which this information reached this office is entirely reliable.—EDITOR.

Port Arthur, Can., November 12.—Editor HARDWOOD RECORD: A friend from London, England, is out here just now looking over pulpwood limits. He has been commissioned in England to locate a supply of white oak ties for railroad purposes, about 9' 6" in length, and if a satisfactory price can be arranged they are willing to contract for a supply of 60,000 ties per month covering a period of ten years. The writer is of the opinion that the best source of supply of white oak is the southern-central states. Would you be kind enough to give me names of lumbermen in the South who could supply this class of material, giving my friend an opportunity to get in touch with them? He no doubt will make a trip to Chicago and travel South from there in a few weeks, but in the meantime would like to get all possible information shaped up before making the trip. He will ask them to state a price F. O. B. cars at any of the ports on the Atlantic coast.

Any manufacturers of ties who have not yet received this information can have the necessary data by addressing HARDWOOD RECORD.

B 828—Wants to Sell Black Locust

Barbourville, Ky., November 13.—Editor HARDWOOD RECORD: We are in position to supply black locust timber in large quantities and do not know the exact market for same. Will you please advise us for what purpose black locust is used in the manufacture of wagons, buggies, etc.?

Anyone interested in purchasing black locust in such large quantities as will make it a staple article can secure the name and address of the above firm by writing HARDWOOD RECORD.—EDITOR.

B 829—Wants Data on Cost of Veneer Manufacture

Boston, Mass., November 13.—Editor HARDWOOD RECORD: Can you give us any information in regard to the cost of making three-ply veneers $\frac{1}{8}$ " thick to $\frac{3}{8}$ " thick—made from logs that cost \$5.00 per M. at the mill? We want the cost of cutting the veneers on a rotary machine and glueing three pieces together to make three-ply veneers.

HARDWOOD RECORD has advised that cost accounting methods so far have not been worked out in the veneer line to any degree of uni-

formity and that discussions and studies along these lines have not proved satisfactory as yet. Suggestions from any of our friends in the veneer and panel trade will be deeply appreciated.—EDITOR.

Clubs and Associations

Yellow Pine Association to Dissolve

At the meeting of the board of directors of the Yellow Pine Manufacturers' Association held in New Orleans, La., November 10, 1914, it was unanimously decided to recommend the dissolution of the Yellow Pine Manufacturers' Association, and the liquidation of its affairs, and the organization of a new association to carry on uniform grades and inspection only, with headquarters near the center of production and that a meeting of all members be called at New Orleans on Tuesday, December 8, at 9 a. m. at Hotel Grunewald to consider both propositions.

The National Lumber Manufacturers' Association has called a meeting of all manufacturers of yellow pine, to be held at Hotel Grunewald, New Orleans, La., Tuesday, December 8, to convene at 2 p. m. for the consideration of a new organization of yellow pine manufacturers.

Indiana Hardwood Men to Hold Annual

At a meeting of the board of managers of the Indiana Hardwood Lumbermen's Association, it was decided to hold the sixteenth annual meeting at the Hotel Severin, Indianapolis, on Wednesday, January 20, 1915.

The business meeting will be held at 2:30 p. m. and in addition to the regular business, a very interesting program is being arranged. The meeting will close with a banquet, at which many guests will be present.

Convention of Upholstered Furniture Manufacturers

Atlanta, Ga., was the headquarters of the annual meeting of the National Association of Upholstered Furniture Manufacturers. About fifty members were in attendance coming from different parts of the country. The addresses were mainly technical and of interest only to the trade. The association is striving to abolish graft in factories, to assure the use of genuine leather, to promote honest advertising and to increase efficiency in factory methods.

Following are the officers of the association: C. J. Kindel, Grand Rapids, Mich., president; F. E. Spearman, Jamestown, N. Y., vice-president; C. S. Kimmeth, Chicago, Ill., treasurer; J. K. Maltby, Chicago, secretary.

Philadelphia Exchange Meeting

The Philadelphia Lumbermen's Exchange held its regular monthly meeting, preceded by a luncheon, on the evening of November 12, William H. Fritz, president, in the chair. Under the persuasion of the office and entertainment committee, Dudley Bartlett, chief of foreign trade bureau of the Philadelphia Commercial Museum, consented to address the members on "The advantage of the Philadelphia Commercial Museum to the business interests of Philadelphia." Mr. Bartlett as a preliminary explained the origin of this museum. He said its present director, Dr. W. C. Wilson, who has been an extensive traveler in foreign lands, where he succeeded in gathering a large amount of raw material to be used in manufacturing, together with much valuable data of a business character, interested a few wealthy friends to place same on exhibition. To this not overpretentious nucleus were added later various other collections of a like nature, and then others, until an interesting and valuable accumulation of stuff was acquired. This was the beginning; since then unlimited sources of knowledge have been added, educational, commercial and economic. Communication with exporters of constructive material in foreign countries has been established for the benefit of the whole business world. The museum library with its manifold works on every conceivable topic and achievement has no counterpart anywhere. This institution is not only the recipient of reports from every consular point but has direct communication with correspondents all over the world; in fact it is in possession of later data of importance as regards some of the foreign countries than the people living there. Names of buyers, condition of business, character of goods needed, cost of shipping, tariff and useful data as to best methods in packing and shipping can always be obtained here. A bureau has been established where merchants unacquainted with the language of any foreign country can have their business letters translated in the language desired. The institution is maintained by appropriation from the state and city, but the running expenses, which are considerable, are met by the fees obtained for valuable data furnished. At this time eighty per cent of the inquiries made can be answered off the reel, while only twenty per cent need further investigation. Trade directories, trade journals, daily and weekly newspapers from every important business center in the world are on file in this museum and open to the public for perusal. It also has on file the records of 500,000 business men in foreign countries. Lectures are given by the institution every day to from 200 to 300 school children, who are divided up into grades on various educational subjects, which lectures are accompanied by facilitating lantern slides; samples of materials used in constructive work are also shown; a public lecture is given every Saturday.

The address was intensely interesting and much appreciated by all

present. On motion thanks were voted to Mr. Bartlett for the treat he had given them.

At this meeting the E. P. Burton Lumber Company and the Ellwood Allen Lumber Company were elected members of the exchange. Routine work completed, an interesting report was read by Thomas B. Hammer, chairman of the committee which attended the convention of the Atlantic Deeper Waterways Association, held in New York, September 22 to 26. The report proved an interesting recital of the great needs of an inter-connecting waterway in the event of war as well as for commercial purposes. Incidentally it is appropriate to state that all reports of committees of which Mr. Hammer is chairman are looked forward to as replete in interest and of valuable data.

The exchange was requested to send delegates to the eleventh annual convention of the National Rivers and Harbors Congress to be held in the New Willard hotel, Washington, D. C., December 9, 10 and 11.

The exchange put itself on record at this meeting as being in favor of a one cent letter postage.

The following resolution was passed:

It has been a great misfortune to lose by death our fellow member and friend, Frank C. Gillingham, who has been identified with this body since its organization. We desire to express our appreciation of his loyal and valuable service, honorable business methods, unquestionable integrity and kindness of heart. He always manifested a keen interest in the welfare of the lumber trade and the success of the Lumbermen's Exchange. He was a Christian gentleman of sterling character whose qualities of mind and heart endeared him to all with whom he came in personal contact. As a token of our deep sympathy we direct that a copy of these minutes be sent to the bereaved family.

A recent report to the detriment of the well-known firm of P. Elmer Weitzel, Bro. & Sons, now known as the Weitzel Lumber Company, reflecting upon the business methods of the concern, was answered at this meeting by Samuel Shoemaker, who personally read the following, which is self explanatory:

Rumors have been circulated that I have charged P. Elmer Weitzel Bro. & Sons with rebbing me and some other customers by short measure in delivery of lumber. I may have said something like this: if so I desire to correct as freely and effectively as possible any statement, impression or rumor that your firm has ever wronged me in any way, shape or form, or anyone else that I know of.

SAMUEL SHOEMAKER.

The meeting then adjourned.

Memphis Club Meeting

There were sixty-two members and guests present at the regular semi-monthly meeting of the Lumbermen's Club of Memphis, held at the Hotel Gavoso, Saturday, November 14. The usual luncheon was served. J. D. Allen was in the chair. A number of out-of-town visitors were present, among whom the following were quite prominent: A. N. Richardson, Chicago; N. H. Walcott, Providence; Horace Taylor, Buffalo; Charles F. Fisher, New York; D. F. Palmer, Paducah, and W. C. Dwyer, Louisiana.

The most important action taken by the club at this meeting was the appropriation of \$500 for the relief of the Belgians. It was ordered that this fund should be given by the club from its treasury and the resolution provided means for the raising of the necessary money if there were not enough in the treasury to take care of this disbursement. A special committee was appointed, consisting of F. E. Stonebraker, chairman; George C. Ehemann and W. L. Cresshaw, to decide upon what channel should be used in getting this fund to the Belgians. A number of the members of the Lumbermen's Club of Memphis have always done a large export business, much of which has been with Belgium. It was the consensus of opinion that nothing could be done that could show the sympathy of the members of the club more than this gift, which met with the approval of all members of this organization.

Secretary Kadel was instructed to write a letter to E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, inviting it to hold its next annual meeting at Memphis in March, 1915.

Resolutions were adopted thanking the statistics committee for its efforts in the direction of securing statistics covering the hardwood business in Memphis during 1913.

The visitors whose names have already been given were called upon for brief talks, and all responded in quite happy vein.

Hoo-Hoo Active

The resonant Hoo-Hoo cry, having sounded again throughout the eastern district of Pennsylvania, a brisk rattling was heard among the dry bones, and lo! a lively re-incarnation of the old favorite organization in Philadelphia. A concatenation was held at the Philadelphia Lumbermen's Exchange rooms on November 3 by the recently appointed vicegerent snark, John J. Rumbarger, who had lined up without difficulty eight kittens anxious to take their first lesson in a purring and spitting contest for glory and renown. Unfortunately some of the embryo felines were compelled to leave town a day or two before the concatenation, others were delayed to their great disappointment on their business trips, which left only the solitary George Houck, general manager of the Highland Lumber Company, Inc., Seth, W. Va., now residing in Philadelphia, to hold up the honor of the occasion, and a brave initiate he was who took his inauguration medicine, nauseous as it was, without a flinch, and enjoyed it immensely. The absentees all promised that nothing short of an earthquake or smallpox should prevent them getting in line at the next concatenation on February 13. The officials who conducted the concatenation comprised the old popular "Thomases": Snark, John J. Rumbarger; senior Hoo-Hoo, Jerome H. Sheip; Junior Hoo-Hoo, Ben C. Currie; bojum, Frank T. Rumbarger; scrivener, St. George Bond; jabberwock, Thomas B. Hoffman; custocatian, Joseph P. Dunwoody; arcanoper, William D. Kauffman; gurdon, George Koon. The

one initiated kitten, who will now undoubtedly be able to make the fur fly, is hereafter to be known as George Show-me Houck, as a middle name is always assumed according to the rules of the order, and this one was appropriately inserted as Mr. Houck came originally from Missouri.

The concatenation over, the whole bunch proceeded to Griffith Hall, on the second floor of the building, where a creditable representation of members with their ladies were in waiting for the banquet. The smiling countenances of twenty-four men and ten ladies is a compelling endorsement of the new departure of inviting the ladies at all the banquets and dinners. With the coming of coffee and cigars Snark John J. Rumbarger made a few pertinent remarks as to what promise the future held for the order in this section, after which he introduced Ben C. Currie as toastmaster for the evening. As a foreword Ben spoke encouragingly of the outlook for this revived order of Hoo-Hoo, especially as Mr. Rumbarger designed to eliminate all objectionable features likely to creep in, and so build it up to a high moral standard.

Mr. Currie then introduced the new born kitten, who contrary to kitten rule displayed wide open eyes, George Show-me Houck, who was not a little surprised that after serving a willing target for the evening's fun he must do the further service of entertaining the guests. However, his claws were kept well under as he smilingly complied with the request. He promised to be a good and loyal kitten and wound up his little speech with a laughter provoking anecdote.

To vary the masculine rule and to show his colors as to the suffrage question, especially as his wife had a sharp eye on him, Mr. Currie called upon Mrs. John J. Rumbarger for a speech. Although taken much unawares Mrs. Rumbarger acquitted herself remarkably well and promised to do much better next time. Emil Guenther, a staunch friend of Hoo-Hoo and the second oldest member present, was next called upon. He thoroughly endorsed the snark in his efforts to build up a Hoo-Hoo here on clean and sane lines, and prophesied that under stricter discipline many new members may be counted upon. The toastmaster next called on Jerome H. Sheip, ex-vicegerent of the order, who also approved emphatically the new rules, especially of admitting the ladies, for which Snark Rumbarger is responsible. Mr. Sheip then explained concisely the origin of the order, and of the emergency death fund a splendid adjunct, which could not be too highly commended. After a few appropriate remarks from Mrs. George Houck, and some more of the members, the singing of Auld Lang Syne closed a specially enjoyable evening. Many absentees say they can be relied upon for the next occasion, as they are hand in glove with a clean cut local Hoo-Hoo.

Plans for Manufacturers' Convention Progressing Nicely

Arrangements for the thirteenth annual convention of the Hardwood Manufacturers' Association of the United States, which is to be held at Hotel Staton, Cincinnati, January 28 and 29, are proceeding rapidly, and the program this year will be of unusual interest. Secretary Weller has already secured two of the speakers, and negotiations are in process with others.

The European war, which has practically closed the lumber export outlet in that direction, has turned attention of lumbermen to possibilities of trade with South America, and the government is now making a study of the South American markets. The Hardwood Manufacturers' Association is co-operating actively with the representatives of the forestry department in this work, and H. S. Graves, forester, Washington, D. C., has consented to address the convention on the subject of "Present Day Forest Problems." Mr. Graves will have an interesting message for the lumbermen as to the possibilities of an export business with South America. About a month ago Roger E. Simmons of the forestry department left for South America to gather first hand information along this line. Mr. Simmons, before leaving, was in conference with the officers of this association, and he has been supplied with sets of the various grades of hardwoods.

Another subject of vital importance to the lumber manufacturer is that of insurance. Lumbermen are already aware, through preliminary announcements in the lumber trade press, of the action by the National Lumber Manufacturers' Association in organizing and backing an Inter-Insurance Exchange. Formal organization has just been effected, and the new venture is to be known as the National Lumber Manufacturers' Inter-Insurance Exchange. Charles F. Simonson of Chicago has been appointed manager of the exchange. Mr. Simonson has consented to address the convention on the purpose and work of the new Inter-Insurance exchange, explaining all details, and he will also answer any specific questions relative to insurance. This new insurance organization will be strictly a lumberman's movement, and operated for the benefit of the insured rather than for private profit.

The association is already beginning to aggressively advertise the meeting, and, like the last convention, is extending an invitation "to everybody interested in the lumber business." Members are being urged to bring their neighbors with them, and particularly those who are not now members. General business and market conditions are such that the lumber manufacturer will welcome the opportunity of attending for the purpose of comparing notes with competitors, as well as getting an all-around idea of the probabilities and possibilities of the immediate future.

Golfers In Tournament

The Philadelphia Lumbermen's Golf Club held a tournament on the links of the Overbrook Golf Club, November 11. Twenty-seven members, divided into six four-somes and one three-some, entered vigorously into the game at one p. m. The game was one of unusual interest, as Presi-

dent J. Anderson Ross had presented a special prize to be contested for and known as the "Belgium Fund Loving Cup." In this connection every member of the club was solicited to contribute one dollar toward the fund now being collected in this city for the Belgium sufferers. The result of this collection was forty dollars.

S. P. Bowers won the president's prize, a small loving cup. He was also awarded first low net prize, score 70, a pair of golf shoes. The second low net score, 77, a silk muffler, went to Horace W. Smedley; third lowest net score, 78, a pair of golf gloves, fell to W. H. Smedley. An additional prize, given by H. C. Magruder, and known as the Magruder high gross prize, was a tie between H. Winfield Allen and William T. Betts, with scores of 124 each. On resorting to a toss up Betts won. No one was enlightened as to the character of the prize, and considerable curiosity was manifested as to the contents of the mysterious package. On opening a dozen beautifully appearing golf balls met the eye. Admiringly they were lifted, but alas! they only proved a clever trick in painted paper.

A fine dinner was served at 6:30, after which the meeting was called to order, with President J. Anderson Ross in the chair. After the reading of the minutes of previous meeting, a resolution of thanks was voted to H. C. Magruder, J. I. M. Wilson, Eli B. Hallowell, Carl Saye and R. Wyatt Wistar, who are members of both the Lumbermen's and Overbrook clubs, and to the Overbrook Golf Club, for courtesies extended. Horace W. Smedley, R. Wyatt Wistar, William P. Shearer and J. Elmer Troth, who tied for a prize in the September tournament, and who made the identical score at Huntingdon Valley Country Club links on the outing of the Lumbermen's Exchange in October, played together again on this occasion for decision as to the prize winners, but so equally were they matched that the result was still another tie. A toss up, which seemed the only settlement, ended in Shearer and Troth hearing off a Norfolk jacket as prizes. J. I. M. Wilson had kindly prepared for the golfers at this meet a light luncheon of which they were invited with much appreciation to partake immediately on return from the links. The weather was ideal and the game, including other events of the day, was enjoyed to the full by all.

National Lumber Manufacturers' Inter-Insurance Exchange

After more than a year and a half of discussion and agitation the officers of the National Lumber Manufacturers' Association have at last launched the inter-insurance department as recommended by the members at the annual meetings of the National association, held in Kansas City, June, 1913, and in Chicago, May, 1914. The new department will be known as The National Lumber Manufacturers' Inter-Insurance Exchange, and owing to the general support promised by the manufacturers will be ready to begin business at an early date.

At a meeting of the board of governors held in Chicago October 6, President Downman was authorized to appoint a committee with power to inaugurate the insurance work of the association. The committee met in Chicago last week, and concluded all the necessary arrangements. The work will be under the direct supervision of the advisory committee, which consists of the following members:

William Irvine, Northern Pine Manufacturers' Association, Chippewa Falls, Wis.; C. F. Wiehe, Northern Pine Manufacturers' Association, Chicago, Ill.; F. E. Waymer, Georgia-Florida Saw Mill Association, Jacksonville, Fla.; W. E. DeLaney, Hardwood Manufacturers' Association of the United States, Cincinnati, Ohio; Chas. A. Bigelow, Michigan Hardwood Manufacturers' Association, Bay City, Mich.; Nathan O'Berry, North Carolina Pine Association, Goldsboro, N. C.; W. A. Holt, Northern Hemlock and Hardwood Manufacturers' Association, Oconto, Wis.; E. A. Selfridge, Redwood Manufacturers' Association, Willits, Cal.; Edward Schwartz, Southern Cypress Manufacturers' Association, Burton, La.; Geo. X. Wendling, Pacific Coast Sugar & White Pine Manufacturers' Association, San Francisco, Cal.; W. B. MacKay, West Coast Lumber Manufacturers' Association, Portland, Ore.; J. P. McGoldrick, Western Pine Manufacturers' Association, Spokane, Wash.; H. H. Foster, Yellow Pine Manufacturers, Malvern, Ark.; J. Lewis Thompson, Yellow Pine Manufacturers, Houston, Tex.; John L. Kaul, Yellow Pine Manufacturers, Birmingham, Ala.; R. H. Downman, President National Lumber Manufacturers' Association (ex officio), New Orleans, La.; J. E. Rhodes, Secretary-Treasurer, Chicago, Ill.

Secretary Rhodes presented communications from over one hundred of the members of the affiliated associations in which they promised to support the exchange from its inception.

Chas. F. Simonson of Chicago, was engaged as manager, and will occupy offices adjoining those of the National Lumber Manufacturers' Association in the Otis building, Chicago. The committee feels fortunate in having been able to secure the services of Mr. Simonson for this office, as he is exceptionally well qualified by experience to place this work upon a successful and satisfactory basis. For the past twenty-five years he has held responsible positions in connection with the insurance

business in both the field and office. For six years he made a study of mill and factory hazards for the Western Factory Mutual Fire Insurance Companies. He was general inspector of the Hartford Fire Insurance Company, western division, for nine years, and during the past few years has been superintendent of the governing committee of the Western Union, Chicago, during which he instituted a uniform system of schedule rating, formulating over thirty-two schedules containing more than two hundred classifications, including schedules covering sawmills, planing mills, lumber yards, etc.

Mr. Simonson is very familiar with inter-insurance, and is considered competent to establish a very thorough system of inspection.

The members of the committee do not believe that the National exchange will be any material competition with the existing inter-insurance associations, for it is very evident that there is more business to be placed than all combined can carry. The influence of the National exchange will be exerted toward the reduction of fire hazards in saw-mill plants. A schedule of basic rates will be prepared as nearly on the basis of rates made by existing inter-insurance associations as possible, and the business of the exchange will be reinsured until such time as it is possible to safely carry its risks alone. No policies will be issued until powers of attorney have been signed representing at least two million dollars' of insurance, and this is already promised on approved plants. Subscribers will not be confined to members of the affiliated associations of the National Lumber Manufacturers' Association alone.

Risks will be accepted upon a basis of physical conditions without regard to association membership. The work of the manager will be under the direct supervision of the executive committee of the advisory committee, which consists of the following members:

William Irvine, Northern Pine Manufacturers' Association, Chippewa Falls, Wis.; W. E. DeLaney, Hardwood Manufacturers' Association of the United States, Cincinnati, Ohio; Edward Schwartz, Southern Cypress Manufacturers' Association, Burton, La.; W. A. Holt, Northern Hemlock & Hardwood Manufacturers' Association, Oconto, Wis.; C. F. Wiehe, Northern Pine Manufacturers' Association, Chicago, Ill.; John L. Kaul, Yellow Pine Manufacturers, Birmingham, Ala.; R. H. Downman, President National Lumber Manufacturers' Association (ex officio), New Orleans, La.

The committee has secured the best possible management, and will take every precaution necessary to safeguard the interests of the subscribers. The success of the National Lumber Manufacturers' Inter-Insurance Exchange is assured from the start.

Annual of New York Lumber Trade Association

About 120 members were present at the luncheon and meeting of the New York Lumber Trade Association on November 11. The occasion was the twenty-eighth annual of the organization, and special efforts were made to have a good representative attendance. Luncheon was served at 1 o'clock and there was much fun of an informal nature. After luncheon the business meeting convened and heard reports

from officers and committees covering the past year. The report of the trustees reviewed in detail the work done since last November.

The election brought back to office for another term all the old incumbents, as follows:

PRESIDENT—Russell Johnson Perrine.

FIRST VICE-PRESIDENT—John F. Steeves.

SECOND VICE-PRESIDENT—Frederick W. Starr.

TREASURER—Charles F. Fischer.

Sycamore in England

The sycamore which supplies considerable timber in England is very like that of the United States, though of a different species. There is always a demand for large sycamore timber, that is, of course, if clean and fairly conveniently situated, and prices are high. It is not often, however, that large, clean sycamore wood is offered in quantity, and when a goodly batch of such trees are put on the market they are generally snapped up at once, the price obtained varying greatly according to district, condition of roads, and distance from railway. But it is rarely that sycamore trees are found in quantity together, such as in a plantation, the bulk of the timber of this kind coming from fields and hedgerows. The sycamore is a farm tree, excellent for shelter, not too hard on the adjoining farm crops, and for these reasons it has become the farmer's friend, and has been extensively planted all over the country. It is a profitable tree, too, as the growth is rapid, and at, say, sixty or eighty years' growth it will contain from forty to sixty cubic feet of wood, which, under the most favorable conditions, will bring 62½ cents per cubic foot in the woodland. This very price was paid for a large number of sycamore trees on the Fernhyn estate, in Wales, the majority of which were removed from farms and hedges at various parts of the estate. The usual price is from 30 to 50 cents.

CHAS. F. SIMONSON, CHICAGO, MANAGER OF THE NEWLY ORGANIZED INTER-INSURANCE EXCHANGE

With the Trade

Klostermann Veneer Company

Notice was published in *HARDWOOD RECORD* recently regarding the incorporation of the Klostermann Veneer Company at Cape Girardeau, Mo., stating it was the successor to the Cape Girardeau Box and Veneer Company of that place. The Klostermann Veneer Company was incorporated under the laws of the state of Missouri, July 24, 1914, with a capital stock of \$40,000, divided into 400 shares of \$100 each. The company takes over the plant formerly operated by the Cape Girardeau Box and Veneer Company and is engaged in the manufacture of rotary cut veneers, principally for the box manufacturers. The plant is on the St. Louis-Memphis line of the Frisco and is so situated that raw material can be secured without trouble.

The officers are J. L. Stout, president; L. K. Juden, vice-president; R. W. Matteson, secretary; Mrs. M. Klostermann, treasurer.

Richardson-Young

Roy S. Richardson, secretary and treasurer of the Richardson Lumber Company and manager of the company's interests at Bay City and Rogers City, Mich., is to be married on Wednesday evening, November 25, to Miss Florence Ambrose Young, daughter of Mr. and Mrs. Walter Dickson Young of Bay City. Both the bride and groom are well-known in lumber circles as well as among a wide circle of social friends outside of the lumber business. Miss Young is the daughter of the head of W. D. Young & Co. of Bay City, which firm surely needs no introduction to the trade.

The ceremony and reception will take place at the Young home, Hide-a-Wee, Bay City, the ceremony being at 7 o'clock and the reception at 8 o'clock.

Miss Young is a social leader in Bay City and is well-known in the social set of many other cities. Mr. Richardson is the youngest man representing any mill in the North. He comes from "lumber stock" and inherits his knowledge of and keen interest in lumber affairs. However, he has gained his experience through close application and has thoroughly mastered every branch of the business. His practical experience, combined with a natural aptitude and liking for the work, has made him one of the most competent lumbermen in charge of northern operations.

Mr. Richardson graduated from the University of Michigan in 1909 and went to work for the Rust-Owen Lumber Company at Drummond, Wis. He went through the entire operation at Drummond, where he worked three years, and from there went to Bay City, assuming the position of manager of the Bay City and Rogers City mills of the Richardson Lumber Company, of which he was made secretary and treasurer.

The couple leave immediately after the reception for an extended trip through the South and Cuba and will return to Bay City some time after the first of the year, taking up their residence in that place.

Receiver for Big Southern Companies

Judge James E. Boyd recently named W. J. Grandin, president of the Grandin Lumber Company of Grandin, N. C., as receiver for the Grandin Lumber Company and the Watauga and Yadkin River Railway Company. Mr. Grandin has already assumed charge of the business as receiver. The railway company is a subsidiary of the lumber company. The total assets of the two companies are placed at \$7,000,000, and the liabilities, secured and unsecured, at \$1,950,000.

Date of Sale of Philippine Concessions Changed

The Bureau of Insular Affairs of the War Department, Washington, D. C., has received a cablegram from Manila, Philippine Islands, advising that the date for the opening of bids at the Bureau of Forestry in Manila for a concession covering the large forest known as the Tayabas-Camarines tract has been changed from November 14, 1914, to January 14, 1915.

First Shipment of Hardwoods Through the Panama Canal

What is probably the first shipment of hardwood lumber to move through the Panama Canal reached Mobile early in the month via the New Orleans, Mobile & Chicago Railroad, coming from the Ferguson & Palmer Lumber Company, New Houlika, Miss. The lumber was moved in a special train of twelve cars and was given a daylight run in order that the benefits arising from the opening of the canal and the advantages of the port of Mobile in connection therewith might be made apparent. Each car bore a large streamer describing the shipment.

Big Blaze at St. Louis Plant

On November 14 the plant of the Henry Quellmalz Lumber and Manufacturing Company of St. Louis was destroyed by fire. According to Henry Quellmalz, president and treasurer of the company, the loss was about \$30,000 and included the storage shed, the wagon and buggy stock factory and boiler house. The plant covers two and a half acres, having a frontage of 300 feet and depth of 600 feet. Origin of the fire was not determined.

Harry Raymond Occupies New Quarters

Harry Raymond of High Point, N. C., advises *HARDWOOD RECORD* that he has enlarged his facilities at High Point for handling veneers and lumber and has taken larger quarters across from the Southern Car Company. He recently added to his veneer and lumber connections the National Process Company of Indianapolis, Ind., and will handle that firm's Atlas vegetable glue.

A Complete Catalogue

Lewis T. Kline of Alpena, Mich., has just issued his 1915 catalogue describing the extensive line of excelsior and wood-turning machines manufactured at his Alpena works.

The excelsior machines include machines for the manufacture of excelsior, and special machines such as baling presses, wood splitters, cut-off saws, brakers, knife grinders and spur grinders. Under the wood-turning machinery he has broom handle machines, spool machines, plug machines, bolting saws and splitting saws.

The illustrations are exceedingly interesting, as they describe a line of machinery that is distinctly special in its character. The excelsior machines are especially interesting.

MRS. ROY S. RICHARDSON, BAY CITY, MICH.

ROY S. RICHARDSON, BAY CITY, MICH.

Mr. Kline has established an enviable reputation for the integrity of his products. He states he will be very glad to give full information to interested parties.

A New Shrinkage Gauge and Moisture Percentage Indicator

C. J. Maural, manager of the dry-kiln department of the A. H. Andrews Company of Chicago, has just issued an attractive bulletin No. 230 describing a Zighometer shrinkage gauge and moisture percentage indicator. The Zighometer is a simple, practical instrument which directly measures the shrinkage (across the grain) of lumber, and which also indicates the per cent of moisture contained in the lumber tested, with reasonable accuracy, sufficient for all commercial purposes. According to claims of the bulletin, for quick and convenient testing of air-dried lumber in the yard and at the kiln, and for the quick and convenient testing of lumber during and after kiln-drying, the determination of moisture content by measurement of shrinkage is easier, quicker and much more convenient and is much more reliable than any weighing process could be.

The booklet then analyzes the subject of moisture content, maintaining that wood contains two different kinds of moisture, one of which is free moisture and the other fibre saturation. The free moisture is contained in the cells and pores and is evaporated first, generally with air-drying. The loss of this free moisture does not shrink or change the wood in any way, excepting certain species not in commercial use.

After giving up all free moisture the wood then only retains the fibre moisture, which is held by capillary attraction in the fibres. As soon as the fibre moisture begins to leave the fibres, shrinkage of wood begins. Slow drying at high temperature will cause shrinkage.

The booklet contains statements that a large number of carefully executed tests have demonstrated:

First: That most air-dried lumber before it is placed into the kiln has been dried to or slightly below the saturation point.

Second: That the actual difference in the shrinkage of test pieces of same length and moisture content, but of different species, is comparatively small and need not be taken into consideration.

Third: That the amount of shrinkage of test pieces of the same length varies in direct proportion to their moisture content. It is on these facts that the Zighometer was designed.

The catalogue contains some excellent illustrations showing the exact working of the instrument.

Death of M. F. Greene

M. F. Greene, one of the foremost hardwood lumbermen of Nashville, died suddenly at his home in that city, aged sixty-one years. Mr. Greene was a member of the Davidson, Hicks & Greene Company, one of the largest firms in this territory. He was preparing to go to his office, when he was suddenly stricken at his home, and died in a few minutes. Mr. Greene was a native of Youngville, Pa., and came to Nashville when twenty-nine years old. At one time he conducted the Union Lumber Company, and later was associated with John B. Ransom & Co. For sixteen years he had been one of the active members of the Davidson, Hicks & Greene Company, having held the position of secretary and treasurer a large part of the time. He was prominent in church and fraternal circles. He leaves a widow and two sons, the latter being J. L. and H. M. Greene, who are associated with the company.

J. W. Thompson and E. E. Taenzer Leave Memphis

Memphis is about to lose two gentlemen who have been prominently identified with the hardwood trade of this section for a number of years, J. W. Thompson and E. E. Taenzer. They will leave Memphis within the next few days to engage in the business of manufacturers' agents on the Pacific coast. Mr. Thompson was for a number of years at the head of the J. W. Thompson Lumber Company. More lately he has been engaged in the commission business under his own name. E. E. Taenzer was the principal owner of E. E. Taenzer & Co., and when this business was closed out he became a member of the Darnell-Taenzer Lumber Company. Several years ago he withdrew from the latter and reorganized E. E. Taenzer & Co., conducting a wholesale business in hardwood lumber. Both of these gentlemen have been quite prominently identified with the Lumbermen's Club of Memphis and with various other associations, and much regret is expressed in local lumber circles over the fact that they have decided to cast their lot in such a far country.

growth. Since 1850 the population of the United States has more than quadrupled, being approximately 100,000,000 at the present time. In the same period, however, foreign commerce has grown from \$318,000,000 to \$4,259,000,000 and the per capita value of exports from \$16.96 to \$23.27. National wealth has increased from \$7,000,000,000 in 1870 to approximately \$140,000,000,000; money in circulation from \$279,000,000 to \$3,419,000,000, and New York bank clearings from approximately \$5,000,000,000 to over \$98,000,000,000, while for the entire country bank clearings have grown from \$52,000,000,000 in 1887, the earliest year for which figures are available, to \$174,000,000,000 in 1913.

Evidences of improved social conditions among the people are also found in the Statistical Record. For example, 19,000,000 children are now enrolled in public schools and about 200,000 students in colleges and other higher institutions of learning, and the total expenditures on behalf of education now approximate \$500,000,000 a year, the result being a rapid increase in general intelligence and a marked decrease in illiteracy. Over 22,000 newspapers and periodicals are disseminating information among the people, and the report shows a steady growth in the number of libraries in the country. In 1850 depositors in savings banks were 251,000 in number; today the number is 11,000,000 with deposits, exclusive of those in other savings institutions, aggregating \$4,750,000,000, or more than 100 times as much as the middle of the last century.

Increased activity on the farms, in the factories, and in the great transportation industries has also developed during the last half-century. The value of farms and farm property increased from \$4,000,000,000 in 1850 to \$41,000,000,000 in 1910; the value of manufactures, from \$1,000,000,000 to over \$20,000,000,000; and the number of miles of railway in operation from 9,021 in 1850 to 258,033 in 1912. In the last quarter-century the number of passengers carried has increased from 492,000,000 to 1,004,000,000, and the volume of freight handled from 632,000,000 to 1,845,000,000 short tons. Nearly 20,000,000,000 pieces of outgoing mail matter are handled annually by the postoffice department, which disbursed in this important public service last year \$262,000,000, or \$2.70 per capita.

The range of subjects included in the Statistical Record extends to many other factors of national life, such as farm production, production of minerals, the consumption of liquors, prices of staple commodities, and financial conditions; while broad outlines are shown with respect to the world's development in population, production, commerce, carrying power, etc. The book is sold by the Superintendent of Documents, Washington, D. C., for ten cents a copy.

American Hardwoods in England

The London *Timber Trades Journal* says that American hardwood conditions, as they affect that side of the Atlantic, continue to move in favor of holders of spot stocks. The demand has been reduced considerably of late, but, on the other hand, arrivals have gradually diminished, for a variety of reasons. Apart from the holding up of contracts by buyers, shippers have in some cases delayed shipment themselves. Then again there was the tonnage available to bring shipments forward, and added to this, buying since the war began has been very restricted. The factor, however, which has had most influence on market conditions and prices is the absence, or rather the gradual reduction, of consignment parcels. There can be little doubt that so far as the outlook is concerned there is no reason to suspect any increase in the volume of consignments in the near future. Freight rates and other things will certainly tend to restrict, if not indeed prevent, anything of the kind for some time to come. The latest advices, if they can be relied upon, says the London paper, indicate

Pertinent Information

Statistical Record of the Progress of the United States

An epitomized record of the nation's growth in area, population, and resources is contained in a pamphlet just issued by the Department of Commerce through its Bureau of Foreign and Domestic Commerce, entitled "Statistical Record of the Progress of the United States, 1800-1914." In all cases where the statistical data permit, the tables cover more than a century; the later inauguration of certain lines of statistics necessarily restricts, in those cases, the period covered.

A half-century retrospect, readily available by reference to tables appearing in the pamphlet, affords a clear perspective of the nation's

THE LATE M. F. GREENE, NASHVILLE, TENN.

J. W. THOMPSON, MEMPHIS, TENN.

E. E. TAENZER, MEMPHIS, TENN.

the possibility of the hardwood mills in the United States closing down forthwith.

Forestry and Warfare

The fighting in Europe has called attention to the possible place which forestry may have in warfare, according to military critics, and incidentally has proven the wisdom of the plans which Uncle Sam has worked out for the planting of screens of trees near the principal coast defenses in this country, particularly the defense batteries that protect New York harbor, Long Island sound and Boston harbor. Trees will also be planted to screen the batteries which will protect the Panama canal where needed.

Americans will be interested to note what use the United States has planned to make of forests, both natural and planted, as a part of its preparations for any possible war in which this nation should ever become involved. Because of the forest cover which already exists along most of the eastern coast of the United States, and also because foreign intervention is considered such a remote possibility, no effort whatever has been made heretofore to maintain or to secure forests for their relation to military movements.

In recent months, however, the War Department has called upon the Department of Agriculture to make working plans for the planting of screens of trees near the principal coast defenses of the East, and experts of the United States Forest Service have already completed the plans for the artificial forests which will screen coast defense batteries which will protect New York harbor, Long Island sound, Boston harbor and Pensacola, Fla. Congress has not yet made appropriation for the planting work, but it is believed that it will do so at the coming session, now that the value of forests in warfare has been demonstrated in the European war.

American army officers have pointed out that the retention by France of certain forests along her eastern border has had a profound influence upon the movement of troops, the placing of batteries and the concealment of war moves in general. It has been stated that the French forests have offered particular advantage to the armies of the Allies because of the character of their growth.

Disease Attacks Mountain Sheep and Goats

The Department of Agriculture has undertaken the investigation of a serious disease which is affecting the Rocky Mountain bighorn sheep and the mountain goats, and is reported as existing on the Lemli national forest in Idaho.

The forest officers think that it is the same disease that caused the mountain sheep to die in great numbers during 1882-83. The nature of the disease is not known, though it results fatally and sheep affected with it seem to have rough and mangy coats and are very much emaciated. Three bureaus of the department are engaged in the study—the Biological Survey, Bureau of Animal Industry, and the Forest Service. A competent veterinarian has already gone to Idaho to start the work.

‘The Last Kick’

Orchardists and foresters say that when a tree is about to die it concentrates all its energy and produces a phenomenal crop of fruit or seeds. This is called “the last kick.”

The walnut trees of England bore an unusually heavy crop of nuts this season, which circumstance is thought to have an uncanny significance. The walnut trees in England were not planted for their nuts, but to have a supply of wood for gun stocks when the hour of need should arrive. The hour has come, and many a walnut grove and isolated tree will stock rifles before the forests bloom again. People who are inclined to be superstitious are wondering why this year's crop of walnuts happened to be unusually large.

The largest walnut grove in England is at Kempston, near Bedford. It contained at first 365 trees, one for each day of the year, which were planted about a century ago by the then owner of the farm, who cynically remarked that wars would never cease and the timber would always be wanted for gunstocks.

Building Operations for October

As compared with September, the building operations for October show improvement. As compared with October, last year, there is a decrease. Permits issued in 71 cities during September decreased 32 per cent, as compared with the permits issued during September last year. The shrinkage in October, as compared with the corresponding month of 1913 is about 20 per cent. The loss in itself is serious enough. The favorable condition is that during the early days of November there have been distinct gains in a number of cities. The easier money markets are permitting the delayed execution of many plans.

The official reports of building permits, issued by 74 cities, during October, received by the *American Contractor*, Chicago, total \$42,657,228, as compared with \$52,988,653 for October, 1913, a decrease of 20 per cent. About one-fourth the cities show gains and about three-fourths, losses. It is interesting to note that among the cities showing gains is New York, the building operations of which for the month expanded 16 per cent over those for October, last year, the boroughs of Manhattan, Brooklyn and the Bronx showing gains, and Queens and Richmond, losses. Scranton and Syracuse make the best statements, gains of 194 and 141 per cent respectively.

For the first ten months of the year the aggregate, as shown in the detailed statement below, is moderately below that for the corresponding period of 1913. Details are as follows:

City—	October, 1914.	October, 1913.	Per Cent Gain. Loss.
Akron	\$ 304,815	\$ 463,425	34

The Inventor of Shrapnel

Most everything seems to get back, sooner or later, to the lumberman. Shrapnel—an explosive shell filled with bullets—are just now being heard and heard of pretty frequently in Europe.

The *Timber Trades Journal* says that it is not generally known that a well-known member of the London timber trade is a great grandson, in direct descent, of the inventor of the shrapnel shell which has been adopted by all countries as a weapon, and in every land goes by the name of the inventor. The gentleman alluded to is H. V. Shrapnel, now one of the managing directors of the North Russia Timber Agency, Ltd. The inventor of the projectile was General Henry Shrapnel, R. A., who was born in 1761, and was the son of the owner of a large cloth mill at Bradford-on-Avon, in Wiltshire. After serving with the Duke of York in Flanders, young Shrapnel, inspired by the trivial effect of round shot and the very limited ranges of case and grape shot against troops in the field, set to work to devise a better projectile, with the result already known. He, however, labored long to bring his invention to perfection, and it was not until 1802 that the spherical case shot, as it was originally called, was adopted for issue to the British army. The statement that shrapnel shell won for England the most important battles in the Peninsula, and even Waterloo, is no exaggeration; the dispatches of Wellington and the reports of high artillery commanders testify to that. General Shrapnel was approached on several occasions by emissaries of foreign powers offering him large sums for the secret, but he spurned these offers, the secret being eventually discovered by a Belgian in 1834. All the government gave General Shrapnel was \$6,000 a year, though William IV. offered him a baronetcy in 1837, which honor he was too poor to accept. He died in 1842 a poor, and it is to be feared, an embittered man. The general's son and heir was compelled to sell the family seat, Midway

Manor, near Bradford-on-Avon, and emigrate. It may also be mentioned that the gate pillars of this residence are still crowned with pyramids of shrapnel shells in their original spherical shape.

Reduction in Mahogany Rate

Otis A. Felger of the Felger-Robbins Company, Havana, Cuba, and Grand Rapids, Mich., has been instrumental, through his protest to the Interstate Commerce Commission, in reducing the rate on mahogany lumber shipped from Gulf ports to Grand Rapids from 33c to 26c on a minimum of 30,000 pounds.

With the former rate in effect the company had difficulty in getting the mahogany manufactured at its Havana mill to Grand Rapids, but with the new rate can compete with mahogany from other centers.

The Havana mill is now working sixty hours a week and doing a good business.

A New Walnut Discovered

It is reported that a new species of walnut has been discovered in Mexico, and that botanists have named it *Juglans mexicana*, which in English means Mexican walnut. The tree is said to be large, shapely, and abundant, and the wood fully equal to black walnut in grain and figure, while the color is more like Circassian walnut. The discovery is said to have been made in the little-known region of southern Mexico. Further information is desirable before final opinion can be formed concerning this new wood. There is another Mexican walnut which has long been known (*Juglans rupestris*). It overlaps into Texas, New Mexico, and Arizona. The tree is small, but the wood is fine, and resembles black walnut. It would appear that the new discovery is something different.

White Pine Whittling Sticks

A former popular custom seems to have passed away. The white pine whittling sticks are no longer heard of as a small but appreciated part of lumber shipments from yard to factory or from mill to yard.

Civilized men like to whittle and there is no wood known that whittles better than good white pine, unless it is pencil cedar. It was once a custom with shippers of white pine to throw a few sticks of this wood into the car for the men at the other end of the line to try their knives on during the hours of meditation on Sunday afternoons while sitting about the premises. No charge was made for the sticks. They went in as a sort of thank offering for the customer who bought the lumber.

Hardwood News Notes

< MISCELLANEOUS >

The City Planing Mill of Dallas, Tex., was destroyed by fire on November 12.

Robert E. McQuay has commenced the manufacture of hardwoods at Richmond, Va.

The Land & Timber Company has been incorporated at Escanaba, Mich., with \$50,000.

The Wisconsin Veneer Company of Rhinelander, Wis., it is advised, will reorganize December 1.

It is reported that plans are under way for the erection of a planing mill at Culver City, Cal.

The International Comfort Chair Company has started business at Boston, Mass., with \$25,000 capital stock.

The Hardwood Lumber Company recently began business at Newark, N. J., in the wholesale hardwood line.

The Waetjen-Ingram Veneer Company has been incorporated to operate at Des Arc, Ark., with \$10,000 capital.

The State Association of Tie Manufacturers and Dealers was formed at Little Rock, Ark., on Monday, November 9.

The F. W. Lombard Chair Company of Fitchburg, Mass., will rebuild its factory which was recently destroyed by fire.

The St. Louis Furniture Workers' Association, St. Louis, Mo., has increased its \$50,000 capital stock to \$100,000.

It is reported from Cheraw, S. D., that the Hickson Lumber Company's mill at Dixie, S. D., was destroyed by fire recently.

The Southwestern Cooperage Company will erect a factory building at Fort Worth, Tex., for the manufacture of barrels.

It is stated that the new plant of the Georgia Basket & Crate Company of Thomasville, Ga., is about ready for operation.

The authorized capital stock of the Tri-State Casket Company, which has been incorporated at Kendallville, Ind., is \$20,000.

According to recent announcements the Blewett Manufacturing Company of Spokane, Wash., will begin the manufacture of harvesters.

It is reported that A. B. Newman of Pine Bluff, Ark., recently took over the property of the Triangle Lumber Company of that place.

J. E. Eacchler of Goderich, Ont., is having plans drawn up for the erection of a furniture factory at that point, which will cost \$50,000.

The International Refrigerator Company of Little Rock, Ark., has been chartered by the secretary of state with a capital stock of \$30,000.

The mill of the Hallett Manufacturing Company of Mobile, Ala., was destroyed by fire November 10. The loss is reported to be \$25,000.

The American Show Case Company is the style of a recently incorporated Columbus (O.) concern which will operate with \$35,000 capital.

The Dominion Tie Company has started business at Dover, Del. This is an incorporated concern with an authorized capital stock of \$100,000.

The Spooner-Campbell Company has started business in New York City. The company is capitalized at \$40,000 and will manufacture farm implements.

The Hallett Manufacturing Company, Mobile, Ala., will install sawmill and handle manufacturing machinery to make 15,000 feet of lumber and 6,500 handles a day.

It is reported from Malvern, Ark., that the Band Veneer Company, which has been operating at that place, has recently been incorporated under the same name.

The Gold Medal Camp Furniture Company of Racine, Wis., is preparing to erect modern buildings in place of several old structures and doubtless will be in the market for new machinery.

The Babcock Lumber & Boom Company, one of the operating interests of the Babcock Lumber Company of Pittsburgh, Pa., and located at Davis, W. Va., was visited by a severe fire a few days ago.

The Wolke Furniture Company has filed articles of incorporation with the Kentucky state capital and will operate at Louisville manufacturing furniture. The company has a capital stock of \$50,000.

It is reported that the Wisconsin Refrigerator Company is contemplating removing its operations from Eau Claire to some other locality farther south. The company is looking over propositions in North Carolina and Virginia.

The Merchants' and Manufacturers' Association of Jackson, Tenn., is negotiating with two woodworking plants located in Canada and Ohio, which have been making inquiries for operating such an institution in Jackson.

James A. Carlson, S. W. Smith, C. W. Catlin, John Weinman, Cal Wolfard, A. Peterson, B. C. Taber, C. A. Dooley and N. N. Metcalf have organized the United Furniture Manufacturing Company at Port Allegheny, Pa.

The Knoxville Lumber and Manufacturing Company, Knoxville, Tenn., is preparing to build an addition to its present woodworking plant and to remodel its warehouse. New machinery to manufacture silos will be installed in the latter structure.

< CHICAGO >

F. R. Gadd, vice-president of the Wisconsin Lumber Company, returned to his offices in the Harvester building after traveling through the South the past two and a half months. He is rather optimistic as to the general outlook through the South.

C. E. Davis, representing the Mengel interests at Louisville, Ky., spent several days in Chicago during the past week.

Thomas Montgomery of Marshall & Montgomery, timber merchants of Liverpool, England, spent several days around the Chicago trade last week.

Fred Mowbray of the Mowbray & Robinson Company, Cincinnati, O., was in Chicago last week on a business trip.

W. M. Milne, president of the Philippine Hardwood Lumber Company of Los Angeles, Cal., was in Chicago for three days of last week on a missionary tour in the interests of his Philippine hardwood lumber.

George Hancock, who is selling dry kilns manufactured by the Grand Rapids Veneer Works, Grand Rapids, Mich., said, while in HARDWOOD RECORD offices last week, that he found a most acceptable tone among the trade which he called on.

Burdie Anderson, general manager of the Old Dominion Veneer Company, North Emporia, Va., sold some satisfactory orders for veneer in Chicago last week during a visit of a few days.

George R. Thamer, president of the Empire Lumber Company of Chicago, died a few days ago after a short illness.

The Parris Upholstering Company has recently been incorporated to operate in Chicago to manufacture furniture and cabinet work. Its capitalization is \$2,500.

W. E. DeLaney, president of the Kentucky Lumber Company, Lexington, Ky., stopped off at Chicago for a few days last week, visiting the trade.

W. H. Weller, secretary of the Hardwood Manufacturers' Association of the United States, Cincinnati, O., was busy in Chicago the past week in the interest of his organization.

Roy E. Pickrell of the Pickrell Walnut Company, St. Louis, Mo., favored HARDWOOD RECORD with a call last week.

William Pritchard of J. W. Wheeler & Co., Memphis, Tenn., and Madison, Ark., was a recent visitor in the Chicago trade.

F. J. Kury of the Williamson-Kury Mill & Lumber Company, Mound City, Ill., called on the Chicago trade lately, and reports business looking somewhat improved.

← NEW YORK →

The directors of the Lumber Mutual Casualty Insurance Company of New York held their first quarterly meeting recently and are able to report fine progress for this new trade insurance organization. The company has \$100,000 of premium income, and to date has had comparatively few losses, so few in fact that there is every likelihood of a substantial return dividend to policyholders if the present experience is maintained throughout the year. There are over 200 policyholders, covering over 6,000 lumber trade employees.

H. J. Gott, manager of the local Babcock office, returned recently from a business trip South. He says things are looking up and expects better business with the new year.

Charles Adsit, who is one of Alex. Morton, Jersey City hardwood specialists, has been receiving a lot of inquiry of late. No, it's not all business. He was recently visited by Dr. Stork, who left two fine boys at the Adsit home, so when the news became known there was much inquiry from his friends in the trade.

Wm. E. Van Wert, Emporium Lumber Company; Geo. F. Gray, A. Sherman Lumber Company, and Ferris J. Meigs, Santa Clara Lumber Company, were New Yorkers present at the annual meeting of the Empire State Forest Products Association at Utica, November 12. Mr. Van Wert continued to Coifer, where the new Emporium mill is turning out a fine hardwood output.

S. S. Spiro, hardwood wholesaler, is now in charge of the hardwood department of W. R. Gardy, prominent Philadelphia wholesale lumberman. He spends part of each week in the Quaker city headquarters, but finds time to keep in close touch with the New York trade, which he covered for so long for H. H. Salmon & Co.

The Sumner Lumber Company reports a fair run of business, considering the universal quiet. Herb Sumner says the first of the year is going to bring real and lasting business to the good of all.

← BUFFALO →

One of the events of interest to the hardwood trade is the first exhibition which the Jamestown furniture manufacturers have ever held. It has been on in that city this month, with a good attendance of buyers and some satisfactory results in the way of sales. Jamestown manufacturers have hitherto depended upon the Chicago and Grand Rapids shows to exhibit their goods and they have reached the conclusion that the buyers of the chief eastern cities can be interested in an exhibition held in Jamestown. An exhibition building is needed and a move is on foot to build one.

The rewards offered at North Tonawanda for conviction of the incendiary who caused the Brady Bros.' fire now amount to \$1,600. A suspect named Albert Lamb has been arrested at Niagara Falls who declines to answer questions about lumber yard fires, though he admits setting fires at Niagara Falls.

The A. J. Chestnut Lumber Company reports a change in the condition of the hardwood flooring trade. For some reasons competitors are cutting prices badly and threaten to spoil what has been a good proposition through the dull lumber season.

Hugh McLean was recently in Bathurst, New Brunswick, looking over the operations of the Bathurst Lumber Company, in which he is interested. The company has its new pulp mill under roof and will make pulp by July 1 next.

Davenport & Ridley are finding a good local demand for 4-4 and 8-4 white ash, in which they have been among the largest dealers here lately. Other hardwoods are reported dull.

Blakeslee, Perrin & Darling find trade picking up a little, the principal trade recently having been in thick oak and thick maple. Local inquiry for lumber is on the increase.

T. H. Wall of the Buffalo Hardwood Lumber Company has been in Canada lately on a hunting trip. The local yard finds trade rather quiet this month.

The J. M. Briggs Lumber Company is now located on the ninth floor of the Ellicott Square building. The company was recently organized as a successor to J. M. Briggs & Co.

The Buffalo Lounge Company has filed plans with the bureau of buildings for a four-story brick addition to its warehouse and factory at 567 Exchange street. The cost will be \$10,000.

T. Sullivan & Co. had a cargo of brown ash on the steamer Bradley, which arrived here a few days ago. The demand for this wood and other hardwoods has been rather light of late.

The National Lumber Company reports a dropping off recently in the demand for flooring, which was good during the summer. The yard is, however, handling some oak and maple flooring at present.

The Yeager Lumber Company states that oak and maple continue to be the best sellers among hardwoods, with a steady sale for cypress.

← PHILADELPHIA →

William Whitmer & Sons, Inc., this city, have taken over the office of the Peale-Coryell Lumber Company, New York, which concern formerly handled the Whitmer lumber in that territory. J. S. Richards, long connected with the Philadelphia company, will be in charge of the New York office.

The Highland Lumber Company, Inc., Seth, W. Va., recently opened offices at 1125 and 27 Real Estate Trust building, this city, which will be the main selling headquarters, in charge of George Houck, general manager. The company manufactures strictly hardwood, and makes a specialty of oak. It has a band mill cutting 75,000 feet of hardwood per day, seventy-five per cent of which is oak, the remaining twenty-five per cent being made up of poplar, chestnut and basswood. The company intends to erect a four-band electric mill in the early spring, which it says will be the most complete and up-to-date hardwood mill in the South.

John W. Coles, the popular young wholesale lumberman, recently returned from one of his annual deer hunting trips in the Maine woods. The fame of John as a crack shot had evidently gone before, for the deer were conspicuously absent, but a big black six-foot bear was foolish enough to keep up his parade—result, "dead bear." John is justly proud of his good luck.

John J. Rumbarger has just associated himself with the Babcock Lumber Company, and will start December 1 on a tour of the company's mills to thoroughly acquaint himself with the stock situation before going on the road.

A disastrous fire which started in Munger & Bennett's lumber yard, Camden, N. J., on November 12, also swept through the plant of the West Jersey Paper Manufacturing Company, causing a total loss of about \$125,000.

The Baldwin Locomotive Works recently received an order from Russia for thirty locomotives, two hundred machine tools and other work, which will aggregate about \$1,500,000. These engines will have to be shipped in two months, which will mean rush work.

Yokum Brothers, Reading, Pa., were visited by fire November 9, which destroyed a six-story cigar factory, a three-story junk shop, lumber yard, two-story wheelwright shop and four dwellings, causing a loss of \$130,000, of which Yokum Brothers' loss is placed at \$100,000; Reuben Hoffa, lumber yard \$12,000, wheelwright shop and frame dwellings \$2,500.

The Orchard Knob Lumber and Coal Company, Wilmington, Del., obtained a charter under Delaware laws, November 17. It is capitalized at \$1,200,000.

← BOSTON →

The Massachusetts Wholesale Lumber Dealers' Association will hold its annual meeting and election of officers at Young's hotel, Wednesday evening, December 2. As the program includes the report of the special committee on incorporation, it is probable that definite action on this important change in the organization will be taken at an early date.

At Portland, Me., the Robbins Point Lumber Company has taken out a charter of incorporation with capital of \$10,000. A. F. Jones is president.

Herbert A. Fuller, a well-known northeastern lumberman, died at his home in Watertown, November 8, aged forty-eight. He is the son of Granville Fuller of the old firm of G. Fuller & Son of Brighton District and vice-president and treasurer of the Fuller-Smith Lumber Company of Boston. The latter firm is now reported as being liquidated. Mr. Fuller entered the business with his father when a young man and has been constantly active among the lumbermen.

← BALTIMORE →

The decision of the Russian government to put an embargo upon the exports of all lumber and woods, including Circassian walnut, is proving unfortunate for at least one Baltimore firm, John L. Alcock & Co., the well-known hardwood exporters, having concluded arrangements last summer for shipments of Circassian walnut logs direct from Batoum. Mr. Alcock had succeeded, after protracted negotiations, in establishing a connection whereby he was enabled to get consignments, the first shipment having come by way of New York. Another shipment was made

The Ferd. Brenner Lumber Co., Alexandria, Louisiana

Manufacturers of High Grade Hardwoods

DAILY CAPACITY
125000 FEET

aboard a German steamer, which was to have landed the logs at Rotterdam, whence they were to have been sent direct to Baltimore, but war was declared and the German steamer put in at Constantinople. The logs were discharged there, but what became of them afterward is still to be ascertained here. The stoppage of exports, therefore, is a serious matter for the firm and means at least a postponement for an enterprise which gave every promise of making Baltimore one of the centers of distribution for Circassian walnut.

The steamer Quermore of the Johnston Line, which got in last week from Liverpool, brought sixty-seven logs of walnut, destined for Cincinnati and other points.

A wedding of much interest in the lumber trade was that of Dudley Day Lawton, a son of William T. Lawton, to Miss Ruth Arnold Crawford, daughter of Clinton Lee Crawford of Roland Park, on November 12. The father of the groom is a member of the firm of Joseph Thomas & Son, manufacturers of millwork, one of the oldest firms of its kind in the city, while the groom is connected with the wholesale hardwood firm of Price & Heald, Knickerbocker building. The ceremony was performed by Rev. Dr. Charles C. McLean, pastor of Roland Park Methodist Episcopal Church, assisted by Rev. Dr. J. Ross Stevenson of the Princeton Theological Seminary. Mr. and Mrs. Lawton after returning from a trip West will make their home with the parents of the groom at 1505 Park place. The new benedict is only twenty-three years old, but has already given evidence of sterling business capacity and has made a number of friends in the trade.

J. Paul Frank, for years engaged in the coeprage business in South Baltimore, died November 12 at the home of his son, William Frank, at Hamilton, a suburb. He was eighty-seven years old and had lived in this city for twenty-five years.

Roger E. Simmons of the Department of Commerce and the Bureau of Forestry at Washington, who has been detailed to visit South American countries and see what can be done to extend the business in American woods there, sailed on his mission November 7 from New York aboard the steamer Voltaire for Rio de Janeiro. Mr. Simmons was accompanied by his wife, and will be away the better part of a year. It was his intention to stay at Rio for about six weeks, getting in touch with leading business men and studying local conditions. After that he intends to continue on down the east coast of South America, taking in other prominent ports and also making trips inland. Next the west coast will be canvassed in the same manner.

Forest fires in the Blue Ridge Mountains of Maryland during the first part of the month overran thousands of acres of timberland and caused much destruction of stumpage. Most of the fires are attributed to the carelessness of hunters.

The report of the building inspector for October is not especially encouraging and discloses the extent of the curtailment that has taken place in the activities of the contractors, largely, of course, because of existing financial conditions. The value of the new buildings for which permits were issued during the month did not exceed \$289,567, \$102,000 being on account of alterations and \$88,000 chargeable to additions. The total is smaller than that for any months this year except January and September, and is far below the returns for June, which holds the record with \$2,246,410, and for February, April, May, July and August, with valuations of more than \$1,000,000. It may be stated, however, that the month represents some gain over September, which indicates that the low mark has been touched and that a prospect of recovery is presented.

◀ COLUMBUS ▶

The announcement is made by the officials of the Hocking Valley Railway Company and the Chesapeake & Ohio Railroad Company that extensive improvements will be made on both lines during the coming year. One of the improvements contemplated is the double-tracking of the Hocking Valley from Columbus to Toledo and the increasing of the dock facilities. The Chesapeake & Ohio will start the work of constructing the line from Portsmouth to Columbus at once. The contract for the construction of a large bridge across the Ohio river at Scotoville has been awarded to the Dravo Construction Company of Pittsburgh.

At a recent meeting of the Ohio Valley Improvement Association at Cincinnati resolutions were adopted urging congress to continue with its appropriations to complete the work of securing a nine-foot stage the year around in the Ohio river. The government was urged to secure at once all necessary dam sites.

The plating mill of H. F. Steffen at Pemberville, Ohio, has been destroyed by fire, entailing a loss of approximately \$10,000. The buildings will be reconstructed.

C. M. Anderson, western sales manager of the Elk River Coal and Lumber Company of Clay, W. Va., has opened offices in the Columbus Savings & Trust building, Columbus.

F. B. Pryor of the W. M. Ritter Lumber Company reports that trade in hardwoods in this section is holding up fairly well when business conditions are considered. Buying on the part of factories is now one of the best features of the trade. Buying is being done by furniture and vehicle concerns. Yards are buying only what they absolutely need for the present. Prices are fairly well maintained, although some cutting is being indulged in. Yard stocks are not large.

J. A. Ford of the Imperial Lumber Company reports a better feeling

in the hardwood trade since financial conditions are more settled. The movement is growing better.

W. M. Ritter, head of the concern bearing his name, was called to New York on business about the middle of November.

Manufacturers and dealers in mill work, doors and sash report a fairly good market when the time of the year and business conditions are taken into consideration.

< INDIANAPOLIS >

The mill of the Deeming Lumber Company at Martioeville was destroyed by fire a few days ago.

The Anderson Box and Basket Company of Henderson, Ky., is considering a proposition to move to Evansville.

About 1,500 employes, who were laid off, have returned to work for the Studebaker Corporation, South Bend, which has received orders for war equipment aggregating about \$6,500,000.

The Bauer Coopage Company at Lawrenceburg has resumed operations, the plant having been closed down since July. More machinery has been installed and extensive improvements made.

A memorial to Bedna Young, a hardwood manufacturer of Evansville recently killed in an automobile accident, is to be placed in the new St. Mark's English Lutheran Church in that city.

S. P. Jennings, lumberman and handle manufacturer of Newcastle, died at his home in that city recently. He was seventy-four years old and is survived by several children.

There is a temporary depression in the hardwood flooring business here because of the practical suspension of building operations, due to inability to negotiate loans for building purposes.

< MEMPHIS >

The Anderson-Tully Company of Memphis has sent a check to the Commercial Appeal of this city as a contribution to the fund which that paper is raising for the relief of the Belgians. The amount was \$200, the largest contribution made by any firm or individual in this part of the country and second only to that of \$500 given by the Lumbermen's Club of Memphis, as reported elsewhere in this issue of the HARDWOOD RECORD.

The Galloway-Kennedy Company, Clarendon, Ark., has been granted a charter as successor to the J. B. Galloway Company. It will engage in the general lumber business. The capital stock is \$20,000, all of which has been subscribed. O. C. Galloway is president and secretary and F. M. Kennedy is vice-president and treasurer.

The Richland Lumber Company, Lonoke, Ark., has filed articles of incorporation under the laws of that state. It has a capital stock of \$25,000. Alphonse Brewster is president, E. H. Ellsherry vice-president, and Oscar F. Brewster, treasurer.

The Lenker Hub Manufacturing Company and the Leslie Ice and Power Company, both of Leslie, Ark., have been consolidated.

John M. Pritchard, secretary of the Gum Lumber Manufacturers' Association, is authority for the statement that there is an increasing demand for red gum for interior trim and that many distributors throughout the country are finding it necessary to carry in stock various items made of red gum so as to be in position to take care of the requirements of their clients. It was feared that the war would tend to very materially reduce the use of red gum, but the activity in building operations and the growing favor of this wood are both factors operating in its behalf.

The Commercial Trust & Savings bank presents the first exhibition of red gum as both an interior and exterior finish. There are several buildings here, and a number of offices, in which red gum is used for interior trim, but this is the only structure where red gum has been used on the outside. There is a revolving door at the entrance to this building and around it are large panels of wood in figured red gum. The inner offices used by the bank are also finished in the same material. It is anticipated that this building will prove a splendid advertising medium for red gum and that this exhibition will stimulate the popularity of this wood.

Russe & Burgess, Inc., are also preparing to make their contribution toward the freer use of red gum. They are having their offices in North Memphis rebuilt and figured red gum is being used throughout. The offices, when completed, will be among the handsomest in this part of the country.

The Mississippi river at Memphis is at the lowest point noted at this season for a number of years. Some rivermen predict that by the end of the current month it will be at the lowest point ever recorded here. Ordinarily this would be quite a serious handicap to logging interests, but there is so little timber being moved that very little inconvenience is being occasioned.

There has been quite an increase recently in the demand for tight cooage material for the manufacture of barrels for the handling of lard. There has also been a considerable increase in the number of barrels made for the handling of cottonseed oil for export. In this connection it may be noted that the Chlekasaw Coopage Company has announced the resumption of operations at its auxiliary plant at Gretna.

The Kelsey Wheel Company is planning extensive improvements at its plant in North Memphis which will cost approximately \$100,000. This company has heretofore been engaged almost exclusively in the manufacture of hickory spokes for automobiles and other vehicles. When the

contemplated improvements have been completed it will be in position to manufacture automobile wheels. These will then be forwarded to the plant of the company at Detroit for the addition of the iron rims. John Kelsey, owner of both the Memphis and Detroit plants, and J. E. Foley, manager of the Detroit plant, have been in Memphis during the past few days in connection with these changes. The very large demand for automobiles is largely responsible for the decision of the company to extend the scope of operations at the local plant.

< BRISTOL >

The Bristol Door and Lumber Company is now operating both its planing and band mills. The band mill was idle for some time on account of a scarcity of logs.

H. G. Guyao of Pennsylvania, who several months ago purchased a large area of timber in Wythe county, Virginia, and began the installation of a mill at Atkins, on the Norfolk & Western, has organized the Atkins Lumber Company, Inc., with a capital stock of \$100,000. The mill is being installed as rapidly as possible and will soon be put into operation. The company has a cut of from ten to fifteen years and is erecting a line of railroad.

Beveridge & Taylor, Inc., this city, well-known lumber, hub and spoke manufacturers, last week closed a deal for a large area of timber near Glade Spring, Va. "We will at once install mills and go to work," said Franck Taylor of the firm. "We have every confidence in the lumber business and do not feel any disposition to hesitate on account of the present dullness in the market. We believe the worst is over and that business will soon improve." The company is operating its mill here full time.

The Honaker Lumber Company, which recently lost one of its mills in Russell county, Virginia, by fire, is preparing to rebuild the plant at once.

The Peter-McCain Lumber Company will resume operation of its band mill in Bristol in the spring. The company will then draw from its new timber supply to Johnson county, Tennessee.

< LOUISVILLE >

One good turn deserves another seemed to be the way the Louisville Hardwood Club regarded its annual election, held November 10, as all of the old officers with one exception were reelected. The present roster is H. E. Kline, Louisville Veneer Mills, president; H. J. Gates, Louisville Point Lumber Company, vice-president; C. M. Sears, Edw. L. Davis Lumber Company, treasurer, and G. D. Crain, Jr., secretary. Mr. Sears is the only treasurer the club has ever had, and is starting his seventh year. Mr. Kline became president of the organization a few months ago following the resignation of S. R. Cecil.

A new organization in an allied trade was formed at Louisville on Friday, November 13, the box manufacturers of the fifth district, including Kentucky, parts of Tennessee, Ohio and Indiana, getting together in a section of the national organization. The meeting was held at the Seelbach, Harry W. Embry of the Embry Box Company of Louisville being chosen president. The next meeting will be held at Cincinnati, O., in December.

Most of the local lumbermen interested in fighting the advance on rates from the South are planning to join with a committee formed at Birmingham, Ala., in the employment of John R. Walker of the Lumbermen's Bureau to handle the matter. Mr. Walker has made a fine impression because of his knowledge of lumber rates and his ability to present the shippers' side to the commission, and the Louisville hardwood dealers think that he will be able to get results in the present case.

Railroad orders are coming in more freely, according to a number of concerns which specialize in this branch of the trade. One house reported getting orders for 750,000 feet of hardwoods in one day recently, most of this being from the transportation companies. Those in central territory are feeling pretty good over their five per cent increase in revenues, and are letting go of some of the business which they have been holding back for so long.

A better feeling in regard to plain oak, which has been the medium of most of the price-cutting seems to exist, as local interests declare that they are turning down orders right along which call for delivery at prices which are unsatisfactory, and are not sufficient to cover the cost of replacement. In view of improving business, the cost of timber and other factors, the hardwood men in this section are rapidly coming to the conclusion that it is a mistake to cut prices on plain oak.

The Louisville Hardwood Club is much interested in the workings of the new federal reserve law and the operations of the regional banks, and has invited a prominent Louisville banker to attend a meeting of the club in the near future and explain the details of the measure.

One of the features of the situation which indicates that conditions are improving is the fact that more inquiries are being received from the consuming trade. This means that the factory men are using up their stocks, and are expecting to be in the market in the near future. The furniture manufacturers are feeling better, and expect to do big business at the forthcoming shows. The railroads are buying, and some export business is being handled. Even the building situation is improving, and while it is unlikely that heavy business from this source will develop before next spring, the trade is sure to be forthcoming, it is predicted. All in all, lumbermen hereabouts have found the silver

lining in the war cloud, and are much more optimistic than they have been heretofore.

The Ohio Valley Tie Company of Louisville, one of the leading manufacturers of ties in this section, has sold its plant and yards at Athol, Ky., to E. Johnson & Sons of Richmond, Ind. C. P. Bush, president of the company, explained the significance of the sale by stating that the company is withdrawing from the Middle Fork of the Kentucky river, but will continue to operate actively along the North and South Forks of that stream.

J. L. Cobbs of the Federal Bureau of Forestry has been in Kentucky recently investigating the co-operative work carried on by the state forestry department and forestry owners. County associations have been formed and the expense of maintaining protection organizations has been divided up, enabling the work to be done on a much more comprehensive scale than would have been possible otherwise.

WISCONSIN

A strong plea in favor of continuing and perfecting the Wisconsin state forestry policy was made by various well-known Milwaukeeans at a hearing held at the Hotel Wisconsin in Milwaukee recently by the members of the joint legislative committee on forestry. The Wisconsin plan was strongly commended and the members of the committee were urged to support the present system.

The Eureka Cooperage Company of Menasha, Wis., has amended its articles of incorporation, changing its name to the Menasha Cooperage Company and increasing its capital stock from \$35,000 to \$50,000.

The L. S. Barber & Sons Manufacturing Company of Butternut, Wis., has installed considerable new equipment in its handle factory and is preparing to place the plant in operation.

The McDonough Manufacturing Company of Eau Claire, Wis., manufacturing sawmill equipment, has been getting some large orders for equipment from southern lumber manufacturers.

It is reported that the majority of the holdings of the Willow River Lumber Company of New Richmond, Wis., have been purchased by L. F. Earle, for the past ten years secretary of the company.

The Northland Lumber Company of Green Bay, Wis., has closed its mill while the plant is being overhauled and some new equipment is being installed.

The sawmill of the Rice Lake Lumber Company of Rice Lake, Wis., has completed its run on hemlock and will remain closed until it starts sawing on its winter run of hardwood.

The Crocker Chair Company has closed its plant at Antigo, Wis., while the factory is being overhauled and considerable new equipment installed. Manager L. I. Gibbs says that the close-down is only temporary.

Herman L. Bump, for many years engaged in the lumber business at Merrill, Wis., and a prominent member of the Masonic order, recently died at Dwight, Ill., at the home of one of his sons. Mr. Bump is survived by a widow and several children.

It is understood that the Glidden Manufacturing Company of Glidden, Wis., whose plant was destroyed by fire some time ago, will probably not rebuild the stove and heading portion of its plant, but that it will replace the lighting and power portion of its establishment.

The Gold Medal Camp Furniture Company of Racine, Wis., is razing its old factory and will erect a modern new structure.

The Cornell Wood Products Company of Cornell, Wis., has completed plans for the erection of an addition to its plant, costing about \$13,000. The structure will be of concrete and frame construction, 68x266 feet in dimensions.

The Sheboygan Cigar Box Lumber and Manufacturing Company of Sheboygan, Wis., has purchased an additional strip of land, 670x135 feet in dimensions, to be used as a site for the new plant to be erected. The plant will include a main building, 60x140 feet in dimensions, and two stories high, a powerhouse, 35x50 feet, a warehouse and a dry kiln.

The Keith & Hiles Lumber Company of Craudon expects to carry on considerable logging this winter and has awarded two contracts, each of which calls for the cutting and hauling of 1,000,000 feet of lumber.

DETROIT

That a Detroit furniture factory is well equipped to handle big business is shown by the fact that J. C. Widman & Co. were awarded the contract to supply all furniture in the mammoth addition to the Fuller hotel. The order will mean greater activity at the Widman plant.

The American Wood Rim Company's plant at Onaway, Mich., is now operating only four days a week. The company manufactures rims and hubs and has had considerable demand from the automobile companies. Business does not warrant the operation of the plant more than four days a week, officials of the company say.

Hebard & Sons have completed an addition of 582x82 feet to their docks at Pequaming, Mich., and now have a greatly increased piling space.

The Northwestern Cooperage and Lumber Company is equipping its cooperage, veneer and flooring mills at Gladstone with an automatic sprinkler system.

The business of W. D. Young & Co., flooring manufacturers at Bay City, is declared to be normal by W. D. Young, head of the firm. The

company is now exporting to several European points and is experiencing no visible effects from the war.

The S. L. Eastman flooring mill at Saginaw was endangered when fire, caused presumably by defective electric wires, destroyed a drill house at one end of the factory. The loss was \$2,000.

The A. E. Cartier Sons Company sawmill at Ludington has suspended operations for the winter. The action is not unusual as it has always been the custom of the company to close for the winter months.

The Ludington Woodenware Company will not remove its plant to Wilmington, Vt., until well after the first of the year. It was first decided to move several months ago and preparations were made in part. The company, however, secured additional timber near Ludington and now has secured a second supply which will keep the factory operating at Ludington this winter.

Three Grand Rapids men, David and Benjamin Wolff and C. L. Lockwood, Jr., are interested in the newly formed Michigan Forest Products Company, a \$100,000 company, which has filed articles of incorporation at Muskegon, Mich. The company will manufacture lumber.

last fortnight, although in some special lines the movement has been fairly active. The war has played havoc with business here for the time being, but the business man feels that it will ultimately prove his friend by bringing an influx of trade to our shore. Stocks at mills and yards are low, and the first forward movement undoubtedly will send prices skyward. Building work keeps up fairly well and a good winter business is anticipated. While local trading progresses slowly the suburban and small up-state towns have been buying more liberally. Hardwood prices remain steady and it is generally believed that rock-bottom has been reached.

< BALTIMORE >

While it cannot be said that the hardwood situation has improved, the statement will hold that the movement keeps up fairly well, with the range of prices about as high as could well be expected under existing conditions. More or less unsettlement in the quotations prevails, to be sure, it being more often a case of how much the seller can get than how much the lumber ought to bring. But the needs of the consumers keep

The Hardwood Market

< CHICAGO >

The local market presents a condition of mixed optimism and pessimism, the gradual change with relation to these sentiments continuing to show a greater and greater following for the cause of the optimists. This change in sentiment seems to be based on actual tangible conditions, such as easing in the money situation, the favorable reports on building outlook, greater manifest interest on the part of factory buyers in 1915 offerings and on very favorable conditions of stocks at mills and consuming yards. For the most part, Chicago mill representatives, wholesalers and yardmen are confident of better developments in the next few months. For the most part they are predicting that the close of this year will begin to show a change and that by spring the change will be apparent enough to indicate fairly normal times. In the meantime, the trade is following the situation closely and is watching its expense account, but not so closely as to make impossible taking advantage of the opportunities which will open when the favorable break materializes.

< NEW YORK >

There are no evidences of anything like real improvement in local hardwood affairs in the past two weeks. There is a very pronounced feeling of optimism, however, and some talk of better business and better prices after the turn of the year. From the South comes word of a better feeling, that lumber stocks are going down and output curtailed and some real business finding its way to manufacturing districts. This has a tendency to give strength to the future local market. There is also more talk of holding lumber for a fair price and all in all we seem to have at least started back to something like normal conditions of trading even if the normal demand is lacking. The season is one of small buying and with only one more month to complete the year it is very probable that buyers will conclude the inventory period before entering the market for more than necessary items.

< BUFFALO >

The hardwood trade is about as quiet as it was a month ago, though occasionally a dealer is found who says that there is a slight improvement. It is not very pronounced anywhere, however, and business could be a good deal stronger than it is without being very active. Ocean rates have gone up so that there has been little doing lately in the export trade, and that means that prices have to stand pretty much on a domestic basis. Not much gain has occurred in the price situation during the past few weeks. Excessive competition prevails, even though many mills are closed.

A hand-to-mouth demand prevails in all hardwoods, but now and then a buyer is found who really needs some stock and is willing to pay a fair price for it. The majority of buyers, however, will not take in much stock during the remainder of the year.

The firmest wood just now is quartered oak, though the call for it is not at all large. The stocks available seem to be relatively small. Plain oak does not share any of this strength, prices being a good deal weaker than formerly. Maple and birch are in only light demand and the same is true of the balance of the list. The flooring trade is depressed, because of a larger amount of competition than several weeks ago.

< PHILADELPHIA >

Business, which is now looked upon as in a transition state, seems to have made a tangible gain since the election of November 3, and confidence as to outlook is expressed on all sides. Many lines outside of the lumber business are having a decided boom due to orders coming in from the war quarters, and there is every reason to believe that a progressive living up in the lumber business is close at hand. There has been no aggressive advance in hardwood lumber buying during the

up to about the same proportion, and the general belief prevails that the lowest point has been touched and that improvement is entirely within the range of probabilities. There is disappointment in the export trade, which so far does not attain the proportions looked for, a condition that grows chiefly out of the diversion of shipments to British ports since the beginning of the war. Stocks in the United Kingdom had undergone some reduction when hostilities broke out. England being in control of the sea, many shipments destined for countries other than Great Britain were turned into ports of the United Kingdom, with the result that extensive additions to the supplies in hand were made, while at the same time the demand was in a measure checked by the centering of interest upon army moves. Thus it is that the British markets, which, with those of France are alone open, reduced their requirements, and expectations of an expansion in the demand failed of realization. This naturally affected prices and has been reflected in the hardwood business as a whole. The mills do not find it necessary to push operations, the plants that turned out stocks for the foreign trade being still shut down or running only part time. Some of the other mills also are curtailing their production, so that the offerings available do not really exceed the current needs. That the returns are unsatisfactory must be attributed to the backwardness of commerce as a whole. But there are signs of improvement. The new currency system has gone into effect and is expected to cause an expansion of credits. The cotton situation is being solved not alone by the opening of the exchanges, but by the raising of the fund of \$135,000,000 to enable growers to hold their crops, and the country is beginning to feel the effect of the exceptional demand for grain and other commodities which is turning the balance of trade in our favor. All these developments are certain to help lumber by augmenting the requirements. The hardwood men therefore have reason to be in a more hopeful frame of mind and to regard the future with a measure of confidence. With the approach of the end of the year any gains that may be made will perhaps not attain a large volume, because of the inherent tendency to hold down at this time, but progress toward a better state of things will none the less continue.

← BOSTON →

The demand for hardwood here is apparently even less than it has been heretofore in the present dull period. It is problematical how long this will continue as there is not a parallel stopping of the using industries. There is some report of the woodworking mills running on part time, but the furniture factories are keeping fairly up to normal conditions. The yard-trade is very light. No changes in values are noted, except in plain oak, which seems to be showing a small increase in quotations.

← COLUMBUS →

The hardwood trade in Columbus and central Ohio has been fairly active during the past fortnight, when business conditions are taken into consideration. The demand is not up to that of the corresponding period last year, but that was hardly to be expected with the general business depression and the European war. On the whole the tone of the market is fair and future prospects are not bad.

The demand on the part of factories is now one of the most important features of the business. Furniture, vehicles and implement concerns are buying better. These factories have very little stocks of hardwoods on hand and will be in the market from this time on. Retail trade is rather slow, as dealers are loath to increase their stocks at this time. They are still following the policy of buying only for the immediate future.

Prices are fairly well maintained, although there is some cutting all along the line in order to force trade where stocks have accumulated. The larger concerns are making a strong effort to uphold prices, but their efforts have only resulted in steadying the market. Some orders are being booked for delivery in December at current prices. Dry stocks are not very large and lower prices are believed to be out of the question.

Railroads are capable of handling all shipments at this time. Collections are reported bad in practically every section of the country.

Quarterned and plain oak are both fairly strong and the volume of business is fair. Prices are firm at the levels which have prevailed for some time. Chestnut is probably one of the strongest points in the market, especially sound wormy. Poplar is moving fairly well and there is no accumulation of the lower grades as in the past. Ash is in fair demand and the same is true of basswood. Other hardwoods are unchanged.

← CINCINNATI →

The hardwood business shows a steady increase over last week and lumbermen are now counting on fair business for the remainder of the year. All lumber consuming plants are showing more activity than for many weeks and about the only branch of the industry not showing real improvement is the furniture trade. Even this line in some of its branches is doing much better than a few months ago, but lumbermen do not look for much from the furniture trade in a general way for some time to come. Inquiries come along steadily and are now resulting in business. Quotations are none too high, however, as dealers realize the

fierce competition for what orders there are, and until demand grows more uniform, prices are not likely to become better. This condition will no doubt continue until after the first of the year, possibly a little longer, but as curtailment at mill points continues and no doubt will be kept up for a couple of months at least, dealers do not expect to have much surplus to contend with after next January.

Stocks in the hands of wholesalers of this vicinity are not excessive, but they are full, and wholesalers replenish stocks as soon as there is any movement outbound, having full confidence in the future steady demand, but they are not buying in any large quantities, preferring to simply keep up full assortments and not buy heavy until there is some indication of advances. Just now there is a very good demand for maple, principally in the thicker stock, but a general demand for all thicknesses. The same is true of ash. Sap gum is in fair request in good grades, but red gum is still moving slowly. Quartered oak seems to be in just a little better demand than plain oak, although there is an increasing interest in the latter. Poplar and cottonwood in the better grades are not moving very well at present, but dealers have much confidence in an early betterment in call for this stock. All low grades for box-making are still in active demand.

— < INDIANAPOLIS > —

There is a little more optimism among hardwood interests in this vicinity than there has been for some time. Business has not improved appreciably in the hardwood trade, but there seems to be every indication that improvement is coming shortly.

There has not been much buying during the last two weeks, but the number of inquiries has increased. Factories manufacturing wagons and other equipment that can be used by European nations at war are showing more activity than they have for some time and it is thought this soon will reflect in orders for hardwoods.

There is a temporary depression in the hardwood flooring business here because of the practical suspension of building operations, due to inability to negotiate loans for building purposes.

Prices are still comparatively steady considering present conditions. Occasionally some one tries to unload stock at a low price, but such instances are few and far between. Most of the hardwood wholesalers and manufacturers are holding up prices.

— < MEMPHIS > —

There has been comparatively little change in hardwood lumber conditions here during the past fortnight. Inquiries have been coming forward at a fair rate and there is some business doing all the while. It is admitted, however, that more orders could be taken care of promptly, but it is suggested in some quarters that there will be probably very little increase in this respect until after the turn of the year. The opening of the federal reserve banks is looked upon as a favorable feature, and comment is made regarding improved conditions in the general business situation. At the same time, it is pointed out that a great many members of the trade will be taking stock within the next few weeks and that they will buy in a somewhat sparing manner.

It is said by some members of the trade here that stocks in some lines are decreasing rather sharply, while in other items stocks are about the same as heretofore. The greatest decrease has naturally been in those items which have moved with the greatest freedom. It also follows that prices are somewhat better on the kinds of hardwood lumber which have been in best demand. This has led to some irregularity, but this has not been an unexpected feature of the situation. A reasonably good demand is reported for the higher grades of both plain and quartered oak, but there is comparatively little doing in the lower grades. Sap gum is a ready seller and the movement of this has been fairly full. Offerings are not so large and some surprise is occasioned over the fact that prices are so low. On the other hand, a little more activity is noted in red gum, which is being used on an increasingly large scale for interior trim. The lower grades of cottonwood and gum are in good demand and prices are well maintained at the recent level. There has been some business recently in 5/4 and 8/4 cypress, but it is understood that prices have not been particularly remunerative. Ash is one of the strongest items on the hardwood list as a result of the recent buying in this section to fill orders booked with English brokers.

Export business, as a general rule, is on a quite limited scale. The war has naturally reduced the demand to an appreciable extent and, even where business is offering, the trade is seriously handicapped by the very high ocean rates. These have advanced out of all proportion to anything witnessed for a number of years and some members of the trade do not hesitate to say that they are practically prohibitive. One prominent member of the trade, who has been doing a fair export business heretofore, said recently that anybody else who wanted this business was entirely welcome to it until such time as ocean freight rates were decidedly less of a handicap.

— < NASHVILLE > —

There has been little, if any, change in the local hardwood lumber market. Dealers are inclined to think that a few more inquiries are being received, but business continues of light volume. Demand is reported for oak and poplar, and same for other lines. The advices re-

HARDWOODS

S. E. SLAYMAKER & CO.

Representing WEST VIRGINIA SPRUCE LUMBER CO., Fifth Avenue Building, Cass, West Virginia. NEW YORK

Over

One Million Dollars

in savings has been returned its members by the

Manufacturing Lumbermen's Underwriters

and there remains to the credit of members over

Nine Hundred Thousand Dollars

The membership, which is constantly increasing, is now composed of nearly four hundred and fifty of the best saw mill plants in the country. Insurance in force exceeds thirty-five million and nearly three million dollars has been paid in losses. If you have a first-class plant adequately protected and are interested in low cost fire insurance, correct policy forms, an inspection service which may save you from a disastrous fire, with the certainty of a prompt and equitable adjustment in case loss does occur, and wish a list of members and annual statement we will be glad to hear from you.

Attorney in Fact
KANSAS CITY, MO.

celved indicate that log operators have practically ceased work in this territory, and should a heavy demand develop any time next spring or summer, the probabilities are that stocks will run short. In the upper Cumberland river territory log operations are at a standstill on account of the lack of orders from the manufacturers. At present stocks are liberal, and dealers will be in position to supply a good demand.

< BRISTOL >

A slight improvement in business is noted in this section, but nothing approaching a revival. Most of the mills have closed down and expect to remain idle until spring, unless there should be unexpected improvement. The yards are only fairly well stocked. There has been some movement of lumber within the past few weeks, but the volume was small. The general feeling among the lumbermen is good.

< LOUISVILLE >

"Business is better." This is the general report heard among hardwood men in Louisville. While trade is not enormously improved, in that the volume is probably not a great deal more than it has been, indications are much more favorable, and prospects for business after the first of the year, and indeed before the end of the present twelve-month, are regarded as excellent. Export business, especially in connection with material required for military operations, is promising, and the railroads are buying. These two factors, combined with improving domestic demand, augur well, especially as building, which has been at a low ebb for some time, is picking up slowly but surely. The federal reserve system has gone into effect, releasing a large amount of money which will be available for the needs of business, and this is expected by lumbermen to have a beneficial effect on the situation. Prices are stiffening somewhat, in that lumbermen are not so keen to take business at any price, but are insisting on getting a price commensurate with the intrinsic value of their stock. In view of the present state of production and the constant increase in the demand, the market is expected to stiffen appreciably during the next few weeks.

< MILWAUKEE >

The most noticeable thing in the Milwaukee hardwood trade at the present time is the optimistic feeling regarding the outlook for business after the opening of the new year. Wholesalers and manufacturers seem to be confident that a revival of trade may be expected in January. There seems to be no denying the fact that stocks are light in the hands of retailers and at the various factories. Everybody has been buying carefully, taking just enough lumber to meet their present requirements, so stocks are at a low point nearly everywhere. General business conditions seem to be showing some improvement and it would seem that there ought to be plenty of building carried on next spring. In Milwaukee, at least, there has been considerable building carried over this fall, which will be brought to a head next spring. Retailers and factory interests ought to be coming into the market more freely after the opening of the new year, in order to be prepared for the early spring trade.

Many of the large factory concerns are beginning to work on their annual inventories and business from this source will probably be a little quiet until this work has been completed. Wholesalers are inclined to believe that the inventory work will help to emphasize the fact that stocks on hand are unusually light.

There was a fair amount of new building launched in Milwaukee during the past week. Although there was a decrease of almost \$75,000 compared with the corresponding week a year ago the record shows up well, considering the past few weeks this fall. During the week there were sixty-six permits issued for work to cost \$224,189, as against ninety-two permits and an investment of \$308,060 during the similar week a year ago.

While there is some price-cutting by various concerns who need the money, on the whole prices are being maintained fairly well. The majority of concerns are inclined to believe that there is value in their holdings and that higher prices can be expected after the opening of the new year and the demand shows more life. Stocks at the mills and in all hands are light and the belief is that hardwood stocks will be well cleared up before spring. Birch and maple seem to be moving fairly well.

< DETROIT >

General business conditions in all lines are showing a little improvement and there appears to be some ground for optimism. The hardwood market, however, is not picking up to any degree, but dealers believe that they will not be long without better business if the improvement becomes permanent.

There is reported to be an encouraging number of inquiries in the Detroit market that would indicate a larger buying. Other dealers report orders booked but that shipments are held up, which has been the case for several months.

The building trade at present is not so bright as it should be. New building is not so large as it was a year ago and it is feared that if conditions do not brighten the total for the year will fall below that of 1913.

EASY TO INSTALL

CHICAGO, July 13, 1914.

The National Dry Kiln Co.,
Indianapolis, Ind.

Gentlemen:

We are very glad to advise you that our kiln, which is installed with VERTICAL PIPING system furnished by you, has now been in operation about six months and results are all that we could desire. We wish to state that this material was received in condition which enabled us to install it from the blue print without any difficulty on our part.

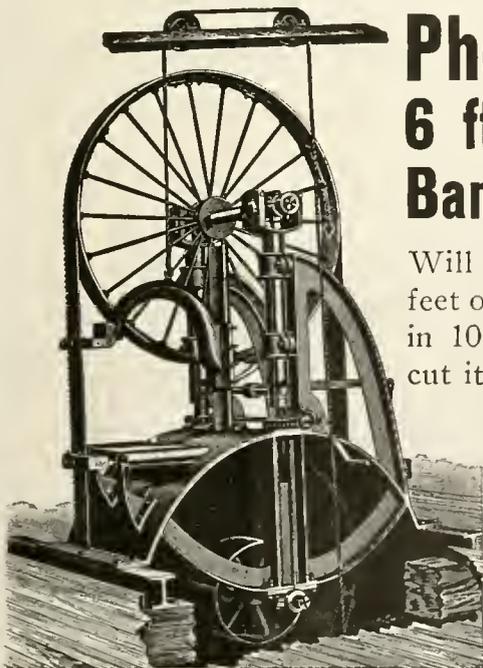

We will be very glad to have you use our company as a reference at any time.

Very truly yours,
ROSELAND MILL & LUMBER CO.,
By R. J. Dickerson.

Perkins Glue Fast Becoming the Standard For All Veneer Work

Manufacturers who use glue for veneer laying and built-up panel work are rapidly realizing the advantages of a glue that does away with the hot, bad-smelling glue room necessary with hide glue and are adopting the modern and efficient

Perkins Vegetable Veneer Glue

because it does away with the cooking process, being applied cold. It is equally as efficient as hide glue and at a saving of no less than 20 per cent over hide glue costs. It gives off no bad odor and may be left open a number of days without souring or in any way affecting its adhesive qualities.

Every shipment is absolutely uniform.

The use of Perkins Glue does away

with blistered work and is affected in no way by climatic changes, thus increasing the advantages of manufacturers, who must ship their goods to hot, cold or damp climates.

Unsolicited testimonials from hundreds in all glue using lines praise its efficiency and economical application.

Write us today for detailed information.

PERKINS GLUE COMPANY

Originators and Patentees

805 J. M. S. Building, SOUTH BEND, IND.

It requires some investment to insure a constant supply of logs for your mill through the purchase of Clyde Self-Propelling Logging Machinery

But remember,

~~You pay more and you keep on paying for the skidders and loaders you don't buy.~~

Now this fact is susceptible of PROOF and we are going to ask you to make us prove it to you.

CLYDE

Do you realize how good a resaw our Ideal is? Every woodworking establishment should have a band resaw, and while you are putting in one, why not put in a good one? Our Ideal Band Resaw embodies the highest type of workmanship, material and design, and is astonishingly low in price. There are a thousand of them in use, giving universal satisfaction, but if their merits were generally known, there would be five thousand. Let us tell you about it, and give you the names of your neighbors who know about this machine.

Brooklyn, N. Y.,

Why Struggle Along

with an old nuisance of a drying system that's perpetually balking — kicking back — laying down — spoiling a scandalous percentage of your product?

The Standard Drying System

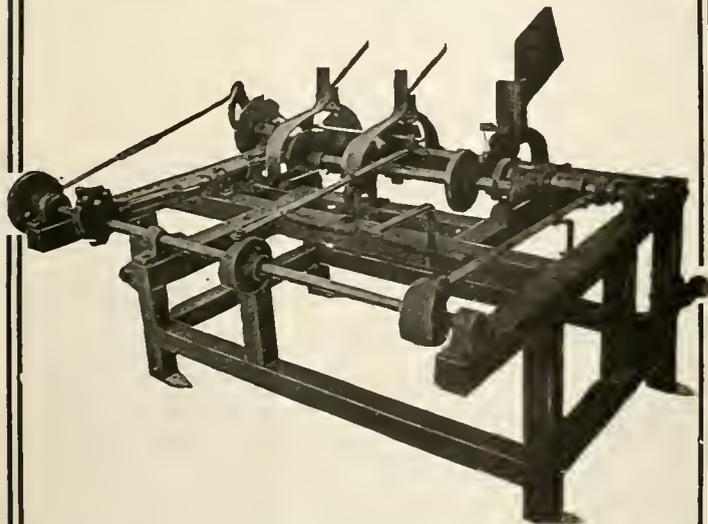

is so adaptable—the drying conditions so completely under control—the apparatus and construction of so high a quality—that the drying is done just right, without fuss or bother, no matter what the variety of the stock.

Write for the catalog and new List of Users. Address: The Standard Dry Kiln Co., 1559 McCarty St., Indianapolis, Ind.

Broom Handle

CHUCKING AND BORING MACHINE

It rounds end of handle and bores small hole in other end automatically at same time. Capacity, 45,000 handles in ten hours. All the operator has to do is to keep the handles fed to the machine. Used by the largest producers. Write for details and price.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

ST. FRANCIS BASIN OAK

THE GALLOWAY-PEASE KIND

* It is a peculiarity of our timber that, growing beyond the over-flow district, it matures slowly—hence has even texture and is soft and light with uniform color.

* Kiln dries without checking. No honey-combing, and minimum shrinkage.

* Total absence of injurious insects insures sturdy, clean growth

* Our band mills cut oak only—hence filer and sawyer get best possible results.

SPECIAL ITEMS ALL BAND-SAWED STOCK

WHOLESALE LUMBER

Always in the market for OAK, GUM and POPLAR

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

What Veneer and Panel Consumers Will Use in 1915

This information is shown in our service of veneer and panel consumers' requirements lists—complete according to 1915 requirements.

The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us give you the details.

HARDWOOD RECORD,

CHICAGO, ILL.

WALNUT AT THE SHOWS

Every indication is that American Black Walnut will again take a leading position at the furniture shows, which will be held next in January. Manufacturers who have been making a few numbers during the past six months will add to their line for the next season; and many additional houses will be represented in the American Black Walnut field. Furniture concerns and lumbermen interested in the furniture trade should consider these facts with reference to their own purchases of American Black Walnut lumber and veneers. For stocks ready to ship, see the list shown below.

89%

of HARDWOOD RECORD subscribers are owners of steam plants. Eighty nine per cent are, therefore, buyers of wood-working machinery. There is little percentage of waste circulation in HARDWOOD RECORD for machinery advertisers.

NASHVILLE

THE LOGICAL PLACE TO BUY HARDWOODS

THE following is a list of stocks offered to the consuming trade by the hardwood lumbermen of Nashville. The character of the timber from which Nashville hardwood men secure their stocks places them in a peculiarly strong position as far as quality of lumber is concerned. Nashville lumbermen have always been noted for their strict adherence to all terms of sale, and in short have an enviable reputation for making good both as to the quality of lumber and as to grading.

The members of the Nashville hardwood trade solicit your attention to these facts and an opportunity of demonstrating their truthfulness.

Review and Outlook

General Market Conditions

BY FAR THE MOST IMPORTANT DEVELOPMENT as affecting the country's lumber trade, and in fact trade in almost all classes of raw material, is specific evidence that the railroads are taking down their "not interested" signs and are actually placing orders for quantities of raw material that amount to a very considerable item in the aggregate. It hardly seems possible that they are actually making plans for increasing their general expenditures for actual equipment, but nevertheless they are planning repair work on a large scale and are demanding considerable lumber for this purpose.

Were the evidence not available through the orders being placed with lumbermen, conditions would be seen by noting the activity in the freight yards in some of the large cities where in many cases long strings of freight cars are laid up on the tracks with gangs of men busy making the necessary repairs, which do not require the cars being taken to the shops. It is only reasonable to suppose that this condition is general and that it includes much more extensive repair work than can be seen without a thorough investigation.

Fortunately this demand for railroad material includes a variety of lines of stock for repair work of different kinds, not only on cars but in other railroad property. The result will be pleasing to all classes of lumbermen as different characters of stock come from different parts of the country.

Another very pleasing development in this period is the almost universal effort being made by hardwood buyers for woodworking establishments to contract for 1915 requirements. In fact there has been a very strong effort in this direction, and only one deduction is possible, namely, that they foresee marked increases in prices during the coming year and are endeavoring to fortify themselves against paying more money for their stocks. As a matter of fact lumbermen are receiving these offers with little enthusiasm as they in themselves constitute the best reason in the world why they should not make contracts.

The export situation is not changed to any extent, there being a considerable aggregate volume of business going abroad. This volume, however, is not being increased to any extent. If the risk of confiscation by the warring nations is not sufficient excuse for non-shipment, the prohibitive freight rates should in themselves constitute a definite check on foreign shipments.

However, in spite of these and all other retardant factors, lumber is being moved in very fair quantities. There is some report from the South that heavy timbers are being resawed into boards for box lumber. This report comes mainly from the yellow pine mill section and is probably the result of the continued activity in the box

business and lack of sufficient demand for heavy timbers. It is a regrettable condition when this long, clear stock is sacrificed in this way.

Actual buying conditions are about the same as they have been for several weeks past with probably a little more alertness on the buyers' part, and with a spotty strengthening in values. There is no likelihood that any marked change will be felt for the remainder of 1914, but all lumbermen will be wise in making plans for gradually augmented call for lumber when 1915 has gotten fairly well started.

One condition will affect at least two of our native woods favorably, this being the difficulty in securing sufficient quantities of mahogany logs from abroad. The risk on ocean shipments is preventing the securing of sufficient quantities of mahogany logs at English mahogany centers to supply the American and English demand. At the same time the call for mahogany veneers and lumber keeps up with fair activity in this country, and good prices are being realized almost universally without exception. If this condition keeps up, with the increased difficulty of securing logs from the original shipping points, it will be necessary to fill in certain lines with acceptable substitutes, especially in the medium grades of furniture. For this purpose birch and gum are recognized as being pre-eminent, and the mahogany situation cannot but affect these two woods favorably.

Regarding the general business outlook, the Department of Commerce has issued some highly gratifying statements that show a tremendous increase in balance of trade in favor of this country for November. In fact the figures are distinctly more favorable than for November, 1913. This does not necessarily mean that our actual exports are greater this year, which, of course, is not true. However, we must realize that we are keeping a great deal of money at home through the checking of our tourists' invasion of Europe, which naturally results in our taking abroad a good many millions of dollars in actual money. The balance is very likely as favorable as it appears, because our imports are reduced to the vanishing point and because of the suggestion above.

HARDWOOD RECORD endeavors to be truthful in its analysis of the situation as affecting its readers. It believes the sources of information from which its digest is prepared to be thoroughly reliable, and is extremely pleased with the opportunity of presenting such an optimistic summary of probable developments and hopes that this opinion will conform to the ideas of at least the majority of its readers.

HARDWOOD RECORD most earnestly urges hardwood and veneer consuming factories to make arrangements for the purchase of as much

DEC 14 1914

material as they can get hold of at as early a date as possible, as there is absolutely no question that there is going to be a much higher price level for all kinds and varieties of hardwood lumber and veneers.

HARDWOOD RECORD also suggests the unwisdom of sawmills contracting for 1915 requirements on the present basis of lumber prices.

The Cover Picture

WHEN THE GOVERNMENT COLLECTS yearly statistics of the country's lumber cut, it omits the output of all mills which produce less than fifty thousand feet a year. That probably excludes establishments like the one shown in the cover picture which illustrates this issue of HARDWOOD RECORD. It is capable of sawing much more than that, if it is operated full time; but many mills of that class are run during a few days, and then stand idle a long time. The government's investigations show that more than twenty thousand sawmills in the United States do not produce fifty thousand feet of lumber a year each. Their combined output falls short of one billion feet a year. That is not a small quantity, considered as a whole; but it is not much more than two per cent of the country's whole cut.

In 1909 the census listed all mills, large and small, and the number was found to be 48,112; in 1912 the small mills were omitted, and the total dropped to 29,648. The argument advanced in favor of omitting small mills from statistics is that the total is not greatly changed, while nearly half of the labor of collecting and compiling the figures is saved.

Notwithstanding the tendency to ignore the very small mill, it fills a place of considerable importance in the neighborhood. It provides lumber for farms in remote valleys and on distant mountains which otherwise would have none. Fifty thousand feet a year is quite insignificant in the country's lumber supply, taken as a whole, but that provides lumber for a dozen or more small farms, for gates, sheds, fences, and for an occasional residence. Frequently the farmer hauls logs to the mill and gives part of the lumber to pay for sawing the other part.

The class of lumber turned out by the small rural mill is usually not very high. The sawyer is not apt to be an expert; but even if he is, there are ways of spoiling the lumber after it leaves the saw. A look at the picture on the cover will make that clear. The sticks in the piles are carelessly placed; all lengths are piled promiscuously, and a general lack of system is apparent. But that is not the worst of it. Fully half of the lumber visible on the yard has not been piled at all. It has been thrown haphazard right and left, tumbled about the hillside and creek bank without semblance of order.

Any man acquainted with lumber need not be told what will be the condition of that scrambled mass of boards after a few months of rain and sunshine. Most of the pieces will be unfit for anything except the roughest and most common uses. Warping and splitting will ruin the best boards; and, if left in unventilated heaps a considerable time, decay will complete the work of deterioration.

Large lumber operations have been accused of great waste. Many of the accusations are not well founded, though some are unfortunately true. Yet, when the worst has been said against the large mills, it remains a fact that it is the small operator who wastes most, in proportion to the amount of work he does. There are mill yards which contain millions of feet of lumber where less waste is visible than is seen in the picture where the yard contains scarcely thirty thousand feet.

The mill in the picture is evidently a hardwood operation. Thousands of such mills are scattered through the woods from Maine to Missouri. Formerly the majority of such mills were operated by water power; but steam engines are now so low in price, particularly second-hand engines, that it is about as cheap to buy one as to make or buy a water wheel. Nearly anything with a boiler, firebox, cylinder and whistle will answer. The man who wants to possess one of these small mills can usually pick up for a mere song an old engine that has seen its best years in the service of a threshing machine, stone quarry or dredge; and by a little skirmishing through the catalogues of second-hand dealers, the equipment can be completed, and the mill is ready to join the ranks of twenty thousand

others which are so small that the statistics of their output are not collected by the Bureau of the Census.

It would be interesting to know how much of the complaint on account of crooked lumber, which is heard from manufacturers, could be traced to small mills which abuse their product after it is sawed, by ricking it in careless piles or scattering it in heaps about the premises, after the manner shown in the cover picture. If such lumber ever reaches a factory, it is bound to arrive in bad condition. It has not seasoned straight because improperly piled; and after it has once become warped and twisted, it can be made straight again only with great difficulty, if at all. If it is used, it is generally after the deformed boards have been cut half away by passing them through the planing machines, at an excessive expenditure of power, unprofitable waste of wood and extra cost in labor and handling. Abuse of property pays nowhere, and it pays less in the lumber yards than in most places. A lean calf may be fattened again; exhausted farm land may be renewed; a dilapidated roof may be mended; but a warped and curled piece of lumber is permanently degraded.

Stand by Your Guns

WHILE SOME PEOPLE seem to be trying to fool themselves into thinking that there is now sufficient mahogany to go round, and that the supply of mahogany logs will continue to be sufficient to meet all demands, those people in the best position to know are frank in admitting that the situation is not at all as it should be, and that if the war continues for any protracted period, there will not only be a scarcity but an actual absence of the high-grade mahogany. At least there will not be sufficient logs to make enough impression on the demand to be considered as any supply at all.

Just what will this mean? The result will be that we will simply be compelled to re-establish our plans and styles of furniture manufacture. Mahogany and Circassian walnut are about the most expensive woods going into the high-grade lines. This country as a whole has been universally accused of living beyond its means and of inexcusable extravagance and pretense in its purchases. Perhaps the enormous quantity of mahogany going into furniture is one instance illustrating this fact. It rather appears now that we will be forced to economize somewhat, and that one of these economies will be effected by spending less money for our furniture.

A period following such a stupendous calamity must be one of close figuring and intensive economy the world over. Whether or not this country is going to benefit exclusively to such a degree that it will be able to satisfy its extravagant tendencies while the rest of the civilized (?) world is counting its pennies, is a question that cannot be successfully answered right now. However, whether we wish to or not, it really seems that we will have to economize in the purchase of furniture. If present indications of a general shortage in mahogany and Circassian walnut logs are borne out by unusual developments in the future, we simply will not be able to buy the high grade lines that are made up of this wood and will have to content ourselves with the more moderate priced lines in the other woods.

This is where the American manufacturer of lumber comes in for his share. Not only will oak find a more active consumption for use, undisguised in its natural figure and tone, but such woods as gum and birch, which are renowned as substitutes for mahogany, will find their field of use very decidedly broadened.

It is quite probable that the attention of the furniture man will be turned toward making his designs and his workmanship as attractive as possible so that he will be enabled to get more out of his stock made from the more medium priced woods. However, the scarcity of mahogany and Circassian walnut, which now seems an almost assured fact, will, if it actually materializes, inaugurate a period of more medium priced furniture in which our native woods will find a ready call.

In the meantime let us not forget the exquisite beauty, the richness and dignity which make furniture made from our own black walnut an article comparable to the best in the world. Enterprising walnut manufacturers have through commendable efforts greatly

stimulated the demand for walnut made articles, and these manufacturers are surely going to benefit by the scarcity of the competitive woods.

Walnut can be given a place among the most desirable of all cabinet woods and is rapidly establishing itself in that place.

Government Interested in Further Utilization of Hardwoods

THE FOREST PRODUCTS LABORATORY at Madison, Wis., has been making plans for some time past to stimulate greater interest among manufacturers of hardwood lumber in working up waste lumber and low grades, and advocates finishing the stuff up at the mill to actual finished sizes.

This dimension stock proposition has been aired and re-aired in so many different ways and on so many different occasions, seemingly without materially changing the situation, that there really is room for doubt as to whether the effort of the Forest Service will succeed no matter how worthy the object might be.

Unquestionably, a great amount of sawmill waste could be worked up, with profit, to special dimension. The restriction of this development has come from two causes. In the first place, the average manufacturer is rather loath to change his methods of operating to the extent that would be necessary were he to consider manufacturing dimension stock. The most serious obstruction, however, has come from the impossibility of operating dimension stock mills, at least for the average manufacturer, on account of lack of standard sizes required and the great risk involved in making up orders ahead without knowing absolutely that the stock will be marketable in the sizes and grades in which it is manufactured. Further, the average consumer has failed to realize the advantage in actual saving and in buying dimension stock where possible, and believing that it, in a measure at least, comes from what otherwise might be very poor lumber or waste, he offers only enough money to pay for the bare cost of the material without considering the labor involved. He forgets that in buying dimension stock made from waste or from any other product of the sawmill, if it is sold to him in good sizes, well-manufactured and cured and in clear stock, it should be worth at least the price of that much footage in clear lumber. As a matter of fact, it is worth more, but it should be sold for at least those figures. It really should make no difference to the consumer if the manufacturer is progressive enough to utilize his waste in that way. As a consequence he does not offer enough money to make the proposition profitable for the millman, the result being that many a man has started to utilize his waste in this way, but has eventually become disgusted with the business and given it up.

With due consideration of the merits of the plans suggested by the Forest Service it really seems that the most logical method of procedure would be to educate the consumer to the advantages he would realize were he to standardize his dimension wants and were he to consider the advantages of dimension stock wherever possible.

Results Must Follow

HARDLY A WEEK GOES BY but that some new effort is launched to attempt to fathom the possibilities of maintaining normal production by the establishment of American-made goods and raw material in markets in different quarters of the globe, which up to now have been neglected entirely.

HARDWOOD RECORD has occasionally mentioned these moves, the latest of which is an expedition which will shortly start from New York or Baltimore, and which will probably be the most comprehensive and thorough-going of any of the efforts toward building up trade abroad.

The Chamber of Commerce of Baltimore has been instrumental in chartering a vessel upon which 300 representative business men from a variety of lines in the East will make an extended tour of the eastern and western South American ports, the purpose being to analyze in the most comprehensive way possible every necessary feature for the furtherance of the development of this trade.

Local information bureaus have been established, as for instance in Chicago, where a certain commercial body has perfected an organization, the purpose of which is to give advice on trade opportunities,

and the best methods to pursue. Altogether the work is going along surprisingly well and should bear fruits in the near future.

While this question is so vividly and actively before us, there may be a tendency to let it gain an ascendancy over the thoughts of the present limitations of our domestic markets, and the possibilities of developing them may be given minor consideration. Our home consumption of raw material and manufactured products is so tremendously in excess of what is shipped abroad that right at home there is offered a great field for further efforts to stimulate trade. Of course it will be argued that considering the matter from the standpoint of the whole country, including every line of business, the economic possibilities of the case demand that the markets which we are now denied, and which have heretofore taken very substantial quantities of our goods, must be replaced by others equally satisfactory.

However, we should not let this thought so dominate our minds that we forget the necessity for maintaining our home consumption and for taking every possible advantage of increasing the home demand. In the lumber business particularly this feature is apt to be overlooked. There are any number of mills which have manufactured almost exclusively for export, and there are even more which have manufactured partially for export and partially for domestic consumption. For the most part all of these mills have shut down entirely, seemingly because they have believed that the cessation of orders from abroad is so serious that it can not be overcome by stimulation of demand in our own country.

There is right here a tremendous field for increased utilization of all kinds of lumber, and were efforts concentrated not only on taking full advantage of known markets but on developing to as exhaustive an extent as possible new markets, it would be a very short time before there would be a very marked favorable development in lumber circles.

A Case of Wood's Superiority

THE STORRS AGRICULTURAL STATION, in Connecticut, is not particularly interested in wood or in substitutes offered in place of wood, but it is interested in conducting investigations to determine how farms may be made to yield best returns. The silo naturally came in for a thorough investigation, and various materials for its construction were studied. Brick, cement, tile, stone, and wood were tried, and it was found that silage that is cured in a wooden silo will produce greater returns than from silos of any other known construction material.

That conclusion, which was reached by impartial and competent investigators, should have much weight with farmers who contemplate building silos. The farmer is not caring about the fight between wood and its substitutes, but he does care when the question involves profit and loss for himself. He wants his farm to pay, and to pay as much as possible. The silo is his most valuable machine for making money, and there is no economy in installing a poor machine when he might as easily have the best.

The silo is becoming a tremendous institution in this country. More than 250,000 of them are in use in the United States, and new ones are added as fast as farmers can build them. They are one of the most potent influences in revolutionizing farm methods and farm life. They are the greatest mortgage payers ever invented. By their use thousands of farms have been changed from loss to profit. It is said that there are counties in the Lake states where every farm is equipped with at least one silo, and some have a dozen; and other sections of the country, both east and west, are nearly as well provided. Soon after the silo becomes firmly established on the farm, the automobile makes its appearance also—a pretty good sign of prosperity.

The point, however, which calls for most emphasis is that the silo that pays best is the one made of wood rather than that constructed of substitutes. It is fortunate that such is the case, because wood is cheaper than any of the substitutes. It is convenient. Every lumber yard has good silo material or can easily get it. No one wood has a monopoly of the demand, but there are dozens which are highly satisfactory for silos, and every region that produces lumber produces the kinds suitable for silos.

World Markets for American Lumber

BY HU MAXWELL
EIGHTH ARTICLE

Editor's Note

Changes move rapidly in Oceania. The "Cannibal Islands" of the old geographies exist no longer. The speed with which that part of the world has been transformed from savagery to semi or complete civilization has been remarkable. When Alfred Tennyson wrote "Locksley Hall," in his younger days, he regarded the islands of the Pacific ocean almost beyond the influences of this world's affairs, and spoke of them as a realm where "never comes the trader, never floats a European flag." But the trader is now well known there, and the flags of Europe are commonplace. Routes of commerce reach all the principal groups of islands, many of which are connected by cables and wireless. Archipelagos which a century ago were visited only by Malay sailors in their catamarans and outrigger canoes, are now provided with wharves, docks, and warehouses, and are ports of call for the largest ships. In some of the islands the natives have disappeared before the white man more rapidly than the American Indian ever took his departure from the land of his fathers in the most palmy days of our own colonization. Australia has 5,000,000 white people; and not enough of the aborigines are left to supply boomerang throwers for circuses. New Zealand's natives are now kept as curiosities, while the last native Tasmanian full-blood died nearly twenty years ago. The Fiji islanders consult books in the libraries to learn what sort of people their grandfathers were. The island of Java exports fifty-six million dollars' worth of sugar a year. The former head hunters of Borneo are growing wealthy raising rubber to supply automobile tires, and even the Solomon and Society islands, which were not long ago regarded as hopeless depths of outer darkness, are now bidding for their share of the civilized commerce of the world.

Oceania is a promising field for the marketing of American forest products of all kinds, including large timber, rough lumber, and manufactured articles. A beginning only has been made in developing the field. Markets have been found in a few places, and such are proving profitable; but there are prospective markets in many other localities where no lumber has yet been sold.

When most of the lumbermen now in business were in school studying geography, the region of land and sea which is now designated as Oceania was called Oceanica. The spelling has been slightly changed, but the map is about the same. The vast collection of islands bears various names in different parts, Micronesia, Melanesia, Polynesia, and Australasia are names for parts of the region, meaning "little islands," "black islands," "many islands," "southern Asia."

It is not necessary, on the present occasion, to discuss these geographical divisions, or to consider them except in the briefest way. The main point is this: Where, among all these islands, is the best lumber market, and how can the exporters of the United States take advantage of it?

Oceania in its broadest sense, includes nearly all of the islands of the Pacific and Indian oceans, but more particularly those east of the one hundredth meridian, not including the Japanese islands.

No man knows the number of islands in this area, and no man will ever know, because they range in size from a bare rock or a sand bank of an acre or two in extent, up to such islands as New Guinea, Borneo, and Sumatra, containing over 200,000 square miles each, or Australia, which is nearly as large as the United States. It would be safe to say that there are 100,000 islands in that vast group, counting all sizes. There are 1,800 in the Philippines alone, and they constitute a mere speck on the map. So thickly studded with islands and clusters of islands are parts of the Pacific ocean that the seafaring nations in their canoes were once able to travel 10,000 miles without touching the same island twice or suffering for fresh water or food.

A SINKING CONTINENT

It is believed by many geographers that the thousands of islands of Oceania constitute the remnants of a sinking continent. If that view of the case is correct, the islands which still appear above water are the peaks and tablelands of the former continent, all the low parts of which have now sunken beneath the sea. It is not particularly important, from the standpoint of the export lumber business, whether there is evidence to sustain the geographers in their views or not; yet, in some ways, it has a bearing on the forest question, which may be briefly referred to in discussing the present forest resources of the various islands, and accounting for some of their peculiarities.

Volcanos and earthquakes have greatly modified some of the islands, and the work of the coral insect has changed the form of others and preserved them from complete submergence. These facts have a bearing on trade routes, harbors, and the location of markets.

POLITICAL OWNERSHIP

The islands of Oceania are apportioned among a number of leading nations. Great Britain is the largest owner, Holland next, United

States third, followed by France, Germany, Spain, Portugal, and possibly others. The combined area of all the islands of Oceania is approximately 4,600,000 square miles, more than half of which area is included in Australia. Borneo and New Guinea are the second largest in size. Each is larger than the state of Texas. Following are the areas of some of the islands:

New Guinea.....	312,000 square miles
Borneo	282,000 square miles
Sumatra	161,600 square miles
New Zealand.....	104,000 square miles
Java	50,400 square miles

Much of Borneo and New Guinea is still in a savage state, but the former seems to be farther along the road to progress than the latter. A forestry department for Borneo has been organized and an American forester has been placed in charge.

The present inhabitants of Oceania are a mixture of nearly all the races in the world. The English, as far as Europeans are concerned, predominate on account of the large and almost pure English population of Australia. Americans are fairly numerous in the Philippines and the Hawaiian islands. Many Hollanders are found in the Dutch possessions. Chinese are pretty numerous on some of the islands south and southeast of Asia, where they are active and successful in trade. In that region they are sometimes called "the Anglo-Saxons of the East." They take no part in politics; do not interfere in affairs of government; and they attend strictly to business.

In many of the islands the aboriginal natives are in a majority; but they are a conglomerate mass, apparently derived from several sources, all of dark skin, and many quite low in the scale of civilization. Cannibalism is said not yet to be wholly stamped out in a few remote places, particularly in New Guinea. The most highly civilized of the native populations of Oceania are in Java.

In most of the islands the natives are disappearing before white men, in the same way that the Indians of the United States died out under the pressure of civilization. It is encouraging, however, to note that on some of the islands the natives have accepted civilization in whole or in part, and the indications are that they will hold their ground and become useful members of the great human family. These are some of the people whom Kipling spoke of as "half devil and half child." They were a part of the "white man's burden," which was assumed in Oceania, and it has been found that when the "half devil" has been gotten rid of, the "half child" develops quite satisfactorily.

The American lumber seller who seeks trade in the islands will find some markets in cities as highly civilized as London and Chicago; but he may likewise push his way into regions where development is just beginning, and primitive conditions prevail. It has been said that man's first requirement is food, and the next is shelter. The lumberman provides the shelter. As civilization works its way from island to island, the lumberman should follow; for the new settlers must have houses and fences.

The population of the principal islands and groups of islands of Oceania has been computed as follows:

Dutch East Indies.....	36,000,000
Philippines	7,635,000

Australia	4,479,000
New Zealand.....	900,000
New Guinea.....	805,900
Borneo.....	660,000
Hawaii.....	186,000
Solomon Islands.....	150,000
Fiji Islands.....	125,000
New Caledonia.....	82,000
Gilbert Islands.....	55,000
Tonga Islands.....	21,000
Marshall Islands.....	13,000
Society Islands.....	12,000
Guam.....	9,000
Total	51,112,000

FOREST RESOURCES

A wide field must be covered before the forest resources of the thousands of islands in the Pacific and Indian oceans can be adequately understood. It is not necessary to go very thoroughly into the matter at present. Reports from time to time on the Philippine forests have been published in American lumber trade papers, and those resources are fairly well known, or, at any rate, persons who are interested have the means of investigating. That part of the Pacific field will not be discussed here. The islands belong to the United States.

The largest land area is Australia. It is an interesting country from the standpoint of its timber. It possesses a larger number of kinds of trees than are found in the United States, but nearly half of all belong to two genera, acacia and eucalyptus. In the United States we have fifty-two kinds of oak, and we consider that quite an assortment for one genus; but Australia has three times that many species of eucalyptus. Some of these are enormous trees, with trunks said to exceed heights of 400 feet; but recent investigations have cast serious doubt on such claims. Nobody is able to tell where the trees of that size are to be found. There is no question that large eucalyptus trees grow in Australia, and some of them yield valuable timber for certain purposes, but as general lumber, eucalyptus has so many more faults than virtues that its usefulness is limited.

The number of species of acacias is twice that of eucalyptus. The acacia is a sort of locust tree. The Australian aggregation is a pretty bad lot. Half of the species are only shrubs and brambles that straggle over the hills, and are worthless even for firewood. A few of the better acacias are cut into lumber for local use.

Of the hundreds of Australian trees listed by botanists, scarcely a dozen kinds appear to be really valuable as a source of lumber, though, of course, some use is made of many more. Australia sent a timber exhibit to the Chicago World's Fair in 1893, and it is presumed that the best was included. Aside from the eucalyptus, mentioned above, the following woods appear to be the only ones of much value in that collection, which is still in Chicago.

Negrohead beech (*Fagus cunninghamii*) has a grain somewhat like mahogany, but more like primavera. The tree is a broadleaf evergreen of large size. Trunks are sometimes eight feet in diameter and 200 feet high. The wood is valuable for general carpentry, for doors, furniture, and machine coars.

Big onion or Australian rosewood (*Diospyros fraserianum*) has a beautiful color, fine grain, and is hard and strong, but no account has been found of any use for it.

Red bean or Australian tulipwood (*Diospylum muelleri*) resembles mahogany, and is used for furniture and shipbuilding. Trees five feet in diameter and eighty feet high are reported.

Australian ash (*Flindersia australis*) is an ash in name only. It lacks the characteristic ash rings of growth. It is used as timbers in railway construction, and likewise as staves.

White beech (*Gmelina richardii*) is valuable for porch flooring and boat decks. The largest trees are four feet in diameter and 150 feet tall.

Australian pine (*Aucicaria cunninghamii*) has a grain not unlike that of the Norway or red pine of the Lake States. Its chief use is as ship-timber—planking, decks, and spars. When Douglas fir is exported to Australia it will probably find this pine a competitor. It is subject to quick decay.

Red cedar (*Cedra australis*) is a cabinet wood which closely resembles the Spanish cedar of which cigar boxes are made in this country.

Cypress pine (*Callitris calcarata*) is much used for shipbuilding and other purposes. This wood is heavier than our white oak, is of a brown color, and splits so easily that small pieces can scarcely be nailed.

There are several so-called oaks in Australia, used for furniture and cooperage.

Teak (*Flindersia bonnettiana*) is nearly as heavy as ebony, is pale yellow, and is used for interior house finish.

OLDEST OF EARTH

The lumber exporter who trades with Australia is dealing with an ancient problem. Geologically speaking, the forests of the vast island are the oldest in the world. They belong to an age long ago dead in other parts of the earth. Both plants and animals look strangely out of date. A superficial examination of the vegetation of Australia conveys the impression that it is unaged. It is not inclined to be conspicuous. In most cases, it makes little show. The trees bear thin canopies of leaves, and the general habit is for the leaves to present their edges, instead of their broad sides, to the sky and earth, thus appearing smaller than they are. In fact, they are often hardly visible.

Notwithstanding their aspect of scantiness, there are 12,250 botanical forms in Australia, and 7,550 of them are found nowhere else in the world. There are 950 species of trees that attain a height of thirty feet. (The United States has 510.) Yet that enormous number provides comparatively little timber, because most of the trees are stunted, scrawny, and withered, starved for water, and scorched by wind. The vegetation seems to have survived from the Cretaceous age, that period of the past known as the "dry age of geology," a million or more years ago. Australia appears to have been cut off from the rest of the world during an immense period of time, and its plant and animal life stood still during all these ages. The Torres strait, separating Australia from New Guinea, is less than three hundred miles wide; yet the two shores of that strait look like parts of two different worlds.

It should not be assumed that all parts of Australia are ancient and fossilized. There are fertile valleys and progressive regions, where nature is not a stranger to luxury. Yet, there are vast deserts and semi deserts.

OTHER ISLANDS

The forests of the other islands of Oceania vary with soil, climate, and latitude. The Malay islands contain 9,000 flowering plants, ranging in size from grass to trees. The timber resources of some of the islands are extensive. Exporters of lumber to those regions must meet competition, provided mills are in operation there. If not now in operation, they will be in the future, wherever suitable timber grows. Many islands with hot, wet climates produce multitudes of vines and soft stems, but not so much valuable timber as a superficial survey might indicate.

EXPORTS OF LUMBER

The principal exports of lumber from the United States to Oceania in 1913 were Douglas fir and California redwood; of the former 209,644,000 feet, and of the latter 47,368,000 feet, in a total of all kinds amounting to 269,506,000 feet. Details of these exports are shown as follows:

	Douglas fir	Redwood
Australia	187,550,000 ft.	46,739,000 ft.
New Zealand.....	9,535,000 ft.	268,000 ft.
French Islands.....	5,904,000 ft.	308,000 ft.
British Islands.....	5,097,000 ft.	8,000 ft.
German Islands.....	1,566,000 ft.	45,000 ft.
Dutch Islands.....	2,000 ft.
Total	209,644,000 ft.	47,368,000 ft.

The white pine exported from the United States to the eastern islands was principally what is known as California white pine. This is the western yellow pine, though it passes under another name. The figures for pine and oak follow:

	White pine	Oak
Australia	1,469,000 ft.	1,606,000 ft.
New Zealand.....	110,000 ft.	274,000 ft.
French Islands.....	40,000 ft.	5,000 ft.
Total	1,619,000 ft.	1,885,000 ft.

Australia bought 6,260,000 feet of yellow pine and New Zealand 76,000. Australia took 494,000 feet of spruce and 561,000 feet of other lumber; French islands 104,000 of spruce and 19,000 of other; New Zealand 76,000 feet of other lumber.

OTHER EXPORTS

The export of forest products other than lumber from the United

States to the islands of Oceania are considerable, with every prospect for more in the future. The following statistics show exports in 1913, all of the figures being in dollars:

Destination	Spirits of turpentine	Resin	Tar and pitch
Australia	\$279,700	\$267,344	\$1,299
New Zealand.....	68,079	40,559	26
Dutch Islands.....	1,156	101,003
French Islands	701	1,135	37
British Islands.....	341
German Islands.....	48	23

Considerably more than one million dollars' worth of agricultural implements go annually to Oceania. The principal items are hay rakes, mowers, reapers, planters, seeders, plows, cultivators, threshers, and various others. Australia took, in 1913, the value of \$22,363. New Zealand, \$294,787, the Dutch islands, \$2,254, British islands \$3,122, and French islands \$80; total \$1,122,606.

The exports of carriages and wagons from this country for the same year are here shown:

Australia	\$10,980
British Islands.....	7,403
New Zealand.....	5,080
Dutch Islands.....	4,097
French Islands.....	2,743
German Islands.....	978

Total

In 1913 the United States exported to Oceania musical instruments to the value of \$213,339, consisting of organs, pianos, player pianos, and piano players. The value of the organs was \$87,427. Shipments went to the following destinations:

Australia	\$199,897
New Zealand.....	12,186
French Islands.....	1,023
British Islands.....	127
German Islands.....	106

Total

Shipments of musical instruments to Oceania compare favorably with those to other parts of the world. The largest sales in Oceania have heretofore been made by Germany.

Exports of cooperage and box shooks to the islands in 1913 were worth \$107,355. Box shooks to Australia were valued at \$7,959, and to the French islands \$2,120. Australia bought \$198 worth of barrel shooks, \$1,347 of heading, and \$27,521 of staves. New Zealand's purchases of staves were valued at \$373. Other cooperage was exported as follows:

Australia	\$59,636
New Zealand.....	7,144
French Islands.....	767
German Islands.....	209
British Islands.....	90

Our exports of furniture totaled \$454,663, of which all but about \$12,000 worth was bought by Australia and New Zealand. The remainder went to the Dutch, French and German islands.

Australia and New Zealand last year purchased incubators and brooders from manufacturers in the United States to the value of \$30,601.

Woodenware was exported as follows: Australia took \$54,683, New Zealand \$9,666, and all other British islands \$110; total \$64,459.

The following values represent the exports of doors, sash, and blinds from the United States to Oceania in 1913:

Australia	\$14,892
French Islands.....	3,767
German Islands.....	2,560
New Zealand.....	2,365
British Islands.....	1,694

Total

House trimming, interior finish, and stairwork were shipped to the value of \$104,218, all of which went to Australia and New Zealand except the value of \$890.

Miscellaneous commodities of wood were exported as follows last year:

Australia	\$395,610
New Zealand.....	116,694
French Islands.....	8,744
British Islands.....	3,964

German Islands..... 1,622

Total

TOTAL EXPORTS

By the addition of the foregoing items of export it may be shown that manufacturers of the United States, in 1913, shipped forest products to Oceania to the value of \$7,683,898. That does not include shipments to the Philippines, Hawaii, and other islands in the Pacific ocean which belong to the United States. If figures were included for those islands, the total would be materially increased.

The exporters of American lumber and other forest products to the islands of the Pacific ocean have competition to meet from many quarters, but chiefly from the islands themselves. All of the inhabited lands possess forests of some kind, and this timber is employed for local purposes, and to that extent shuts out imports. Some timber is brought to the islands from Japan and the continent of Asia. The American exporter is able to secure and hold markets there only so far as he is able to meet competition. There is no open field, waiting for the first comer. The lumber trade with America has been built up slowly; but it is on a substantial basis with prospects of steady growth as population increases.

LONG DISTANCES

One of the important facts to consider in the trade between the United States and Oceania is the great distances which separate our ports from the markets which we are desirous of reaching. The routes are long. The nearest islands of Oceania lie nearly as far from our shores as Europe from America, and the remotest are nearly half way round the world. Fortunately, ocean transportation is cheap. The loading and unloading of vessels costs no more for a voyage of ten thousand miles than for a hundred miles.

Heretofore, practically all of the lumber which Americans have sent to Oceania has gone from our Pacific coast ports, and it has consisted largely of Douglas fir and redwood. These are soft woods, of a class with which Oceania is not well supplied by its own forests.

Hardwood lumber from the United States has never gained any foothold on those islands. In the first place, they have much hardwood of their own, and in the second place, the hardwoods of the United States grow east of the Rocky Mountains and it has been expensive to send them to the markets of Oceania, because it was necessary first to ship them by rail to the Pacific coast before placing them on board of vessels for the long ocean voyage.

That handicap on our hardwoods has now been in part removed by the opening of the Panama Canal. Cargoes from the Atlantic and Gulf ports can go unbroken from origin to destination. It remains to be seen what effect this will have on hardwood lumber exports from this country to Pacific islands. It is doubtful if much more hardwood lumber will go than heretofore, but there ought to be a large increase in manufactured products. It should be possible to build up trade in hardwood flooring, furniture, fixtures, interior finish, musical instruments, woodenware, cooperage, and vehicles. A good start has already been made in all of these lines. As the population of the islands increases, our exports of manufactured forest products ought to grow. The hardwood manufacturer's opportunity lies in that direction. The Pacific coast softwoods will probably continue to go in the rough form about as heretofore, except that gradual increase of business should take place.

PROSPECTIVE TRADE

The total land area of Oceania is more than a million square miles greater than that of the United States, and its population about half as large. More than half of the population of all Oceania is in the single island of Java, which is about as large as Alabama. Its population exceeds that of Australia nearly six fold, although Australia is fifty times as large.

The case of Java is cited as an example of the enormous population which some parts of Oceania are capable of sustaining when fully developed. Even Java is only one-fourth under cultivation; but it has long been at peace, and the people are industrious. They sell \$56,000,000 worth of sugar a year, besides many other things which the land produces. Other islands, as fertile as Java, are just emerging from savagery, notably Sumatra, Borneo, New Guinea, the Fijis,

the Celebes, and many more. They have little to sell as yet, consequently are not in the market for our lumber, furniture and other similar products; but the markets in those enormously fertile islands are beginning to open. Civilization is taking hold. The natives are either going to work or they are disappearing and progressive populations are taking their place.

They will buy from us as soon as they have anything with which to buy, provided we offer them what they want, and on terms which they can meet. They will want structural timber, building lumber,

and all kinds of manufactured forest products. While our exports are holding to the trade which they already have in that field, they should push for more. The opportunities are increasing and will continue to increase. A firm foothold obtained at the start is half the battle. No business rivals have advantages to compare with those of America, so far as the manufacture of forest products are concerned; and along some lines, we possess great advantages over all others in supplying building lumber and structural timber of the best grades and largest sizes.

Electricity in the Sawmill

Electric transmission in the modern hardwood sawmill should save power. This, however, is only part of the saving: It saves space. It lessens danger by eliminating the entangling lines of shafting, gear and belts, and it makes it easy to set the machinery wherever it will serve its purpose best. It should also help reduce the upkeep cost by eliminating the great network of shafting and belts. It used to be that the item of cost of installation stood conspicuously in the way of the use of electric transmission in the sawmill. We have reached the point now where this item of cost does not look so big when weighed against the cost of shafting, belting and gears. Leather has become so high that a big leather belt for a drive makes a weighty item in cost itself. Then comes the installation of framing, bridge trees and journal boxes until the electric equipment does not loom up big as a cost proposition like it seemed to at one time.

One of the advantages of electric transmission that is readily appreciated by any one responsible for the upkeep of the sawmill equipment is in the elimination of heavy gears involved in right angle drives and in dispensing with complicated belts. Electric transmission does not necessarily eliminate belting entirely, but it does simplify the problem and it eliminates that dangerous entangling network of these things. It simplifies the problem of maintenance as well as that of setting the machinery where it will do the most good.

There is plenty of argument in favor of electric transmission inside the sawmill proper, for the machinery equipment ordinarily used there, including edgers, trimmers, etc. When it comes to additions to dimension stock plants, planing mill equipment and other special equipment that should long since have been made a stronger feature of every hardwood sawmill of any magnitude, electric transmission is practically the only correct answer. Before the advent of electric transmission it was necessary to extend long lines of shafting and belts, and attach other equipment on the side as an addition to the sawmill plant, or else it was required to erect an entirely new power plant at one side.

With electric transmission one can from one central plant distribute current for driving equipment at any distance. This makes it easy to put the necessary distance between the plants to reduce the fire hazard and the insurance cost.

Among some of the big yellow pine mills in the South, electric transmission has resulted in the equipping of a separate central power plant apart from all the mill buildings proper. There all fuel can be concentrated and all power produced that is needed in any of the surrounding buildings.

The hardwood sawmills may never find it advisable to go to the elaborate extremes in distributing and equipping plants that has been indulged in by the pine mills, but there is certainly room for great improvement in the efficiency and economy of hardwood sawmilling, through the use of electric motors and electric transmission.

There has not been a better time for a general overhauling of sawmill equipment than right now. It is while business is slow that the forehanded man prepares for the busy times to come and studies and plans for improvements that will make for a higher order of efficiency. There is perhaps no line of improvement which offers greater possibilities than electric transmission. It is unnecessary to go into any elaborate technical details or figures of comparison here.

All the data one may require in that line can be obtained readily from the electrical machinery people, who have made an extensive study of the subject and are prepared at all times to furnish figures and technical information.

The important thing for the sawmill man seeking improved ways and greater efficiency is to take hold of the subject, get in touch with the people who supply this equipment and find out for himself what possibilities it holds. Incidentally it may be mentioned that one of the things the average millman will find out is that when he once takes up electric transmission he will stick to it, and he will find it so much easier to install and operate machinery for making dimension stock and other special items that he will be encouraged to do more of this and to utilize his timber to better advantage.

A New Substitution

A correspondent of an English trade paper advocates the substitution of mahogany gunstocks for black walnut, on the ground that the former is cheaper and is as good. At present the gunstock problem is pretty serious in England, and the correspondent criticizes the government for sticking to walnut merely because it has long been the custom to equip guns with walnut stocks.

The fact is, the employment of walnut is not a matter of fashion but is due to qualities which make it extremely serviceable. Mahogany is an excellent wood, and probably its principal drawback when made into gunstocks is its weight and low elasticity. It is about seven pounds per cubic foot heavier than black walnut; but to compensate for excessive weight, it is about forty per cent stronger than walnut. Taking advantage of its greater strength, smaller stocks might be made to answer, and by doing this, a mahogany gunstock should be no heavier than one of walnut.

Weight and strength are only two of the factors entering into the gunstock question. The principal one is the elasticity of the wood, and it is here that, weight for weight, black walnut is unquestionably superior to mahogany. Elasticity is important in taking up the jolt caused by the discharge of the gun, and it saves the soldier's shoulder. That may not be of as great importance with the modern military rifle as with the old fashioned musket whose "kick" was stunning; but the recoil of the modern rifle needs an elastic stock to take up the shock. Mahogany will do it fairly well, but not well enough to justify its substitution for walnut. Weight for weight, the elasticity of black walnut is twenty-five per cent greater than that of American mahogany. It is probable that some of the African mahoganies would make a different showing. Some of them, particularly okume mahogany, are much lighter than black walnut, but figures to show their elasticity are not available.

The claim that Cuban or Santo Domingo mahogany is cheaper in the English market than American black walnut is surprising. It is generally supposed that walnut is from twenty to fifty dollars cheaper per thousand feet.

Aside from elasticity and weight, the comparison of walnut and mahogany does not show great differences in the qualities required in gunstock material. Both are of dark color and are not easily stained. They are not inclined to warp, check, shrink, or swell when they have been well seasoned. They take high polish and are handsome.

The Lumbermen's Round Table

Honesty the Best Policy

Somewhere back in the dim and distant past, you probably remember writing in your copy-book these historic words: "Honesty is the best policy."

Since then you may have had experiences in the hardwood lumber business that seemed to suggest that the copy-book man was all wrong, and that in order to succeed, it was necessary to depart a little now and then from the straight and narrow path. The reasons were as numerous as the methods were devious: competition, the requirements of the customer, the necessities of the business, et cetera, et cetera.

A group of hardwood jobbers sitting around a dinner table not long ago, got to talking business, and this subject came up. It is significant of changes in sentiment and of changes in conditions under which the hardwood trade is carried on to know that every one present agreed that the day when manipulating grades would pay has long gone by, and the customer can now gamble on getting what he asks for.

Ethics—or Plain Business?

There was nothing in the decision referred to above to suggest that these lumbermen regarded the old-time method as a relic of the stone age of business because they had adopted a system of morality above that of the hardwood men of another day and generation; but the agreement that it is now the best policy to tote fair with the customer in every respect was due simply and solely to the fact that lumbermen have found that it pays.

The man who is manipulating the grade may think that he is making a lot of money on a shipment; but by the time that he figures it all up; by the time he adjusts any complaint that may be made; by the time that he considers the loss of good-will which will accompany possible dissatisfaction with the lumber, he will find, if he is honest with himself, that he has not made any more than he would have done if he had given the customer all that he expected to get.

It simply doesn't pay to do business on any basis which does not take into account the ultimate satisfaction of the customer. Retail merchants learned that sooner than manufacturers and wholesalers did—but the latter, even in the lumber business, are finding it out rapidly.

Permanent Trade Counts

After all, what are you working for?

Is it one order from a customer—or that customer's regular business?

Isn't it true that you make more money on the business of the concern which you get without hard solicitation, and retain on the basis of giving full value and service and satisfaction all along the line, than on the trade of the consumer who buys one car, feels that he hasn't got what was coming to him, and passes you up next time?

The former method makes for permanence in business, for good-will, for low selling expenses, because, as has been remarked so often that a great many people in the lumber business are beginning to believe it, a satisfied customer is the best advertisement. The other system results in having to keep on an eternal hop, skip and jump for new connections; and making new connections all the time costs a lot of money. A plan of that kind means that the sale has got to be on a wide margin to enable the seller to do business, because he can't count on a repeat order to lower the expense of getting trade. After all, it's an expensive way to carry on a business, because it makes previous experience of little or no value. It throws away the information about credits and special factory requirements and everything else learned in dealing with a customer for the doubtful advantage of going on to somebody else who is expected to play the part of the honeysuckle opposite the lumberman's bee.

Getting Regular Trade

A leading hardwood man acknowledged not long ago that he had only one customer who gave him all his business without questioning even the price.

"And you can bet he doesn't lose anything by it," he continued. "He has been sending me his orders right along without asking what I was going to charge him, and whenever the market changes in his favor, I invariably give him the benefit of it. Not long ago I advised him that his poplar would cost him \$3 a thousand less than before, and I have made reductions in plain oak as conditions warranted. He gets full grade and the best lumber I have in stock on every item. He has shown his confidence in me, and I am showing him that I deserve it.

"The average customer suspects you of trying to hold him up, and gets quotations from all over the country before he gives you the business. Then he examines every board with a microscope to make sure that he is getting all that is coming to him. He is taking the attitude that you are guilty until proven innocent, and in a case of that sort there isn't much inducement to go out of your way to give him extra measure, because he wouldn't appreciate it. But when I have a customer like the one I spoke of, he gets 100 cent's worth of lumber for every dollar he pays me, and it's a connection that is profitable to both of us."

There's a suggestion here for lumbermen and lumber consumers alike to consider.

Buying Logs for Profit

An experienced log buyer pointed out recently the weakness of the work of the average timberman sent out by the hardwood manufacturer.

"Most log men," he explained, "go out into the country thinking chiefly of how much they can pay for logs. In other words, they are unconsciously taking the position of the man with logs to sell, instead of the correct attitude of the buyer, which should be to get the logs for as little as necessary. Competition, of course, is responsible for that, but it means that the log buyer is not studying the interests of his employer as closely as he should. Instead of trying to insure a profit on every bunch of logs he buys, he seems to have an idea that the main object is to get the logs. That is one of the things he must do, of course, because it's his job to supply the mill with material; but he should remember that if he went high enough in his prices, he would soon bankrupt the lumber company. Instead of thinking constantly about how high he may go, he should devote some of his attention to the proposition of how low he can buy the logs.

"Quick purchases make for high prices. The man who tries to see the owner of timber, look at the trees or logs, and close a deal in an hour or two, is sure to pay more than he could get them for otherwise. The farmer is a cunning sort, and he is going to quote the top price first, and attempt to play one buyer against the other. Holding off a little and showing a disposition to wait him out will very frequently bring down the price to a reasonable figure."

In view of the fact that the log price is the basis from which the sawmill man must start, and is certainly easier to control than the selling price, it looks as if the suggestions made above are worth pondering over, and worth having the log buyer ponder over as well. Maybe it wouldn't hurt to have him pray over it a little.

Business Credit

Apropos of the remarks in this department of *HARDWOOD RECORD* for November 10, on the subject of broken contracts, unearned discounts, etc., the following from the current issue of the *Efficiency Magazine* is of interest:

"In the business world, a man who breaks a contract is called dishonest.

"Men do business with scraps of paper; they pledge their honor, faith and fortunes.

"Business men cannot say, 'Oh, yes, I broke my contract with you,' 'I changed my mind,' 'I found it was to my advantage to make other arrangements.'

"A breach of contract entails penalties by destroying confidence, and a business man lacking the confidence of his fellows has no business credit."

The Disappearing Chestnut

Previous to the discovery of the deadly nature of the chestnut tree bark disease, the lumberman and the forester looked with favor upon the chestnut tree. The lumberman regarded the chestnut as a valuable timber tree—not so valuable as the yellow poplar or some of the oaks, certainly not in the class with cherry and walnut, but a good standby because of its abundance and its many uses. In the woodlot the chestnut was regarded by the farmer with favor and in many sections it was the standard wood for farm uses. The forester considered the chestnut among the most desirable of hardwood trees because of its rapid growth, and the ease with which it could be reproduced. All that was necessary was to cut it in fall or winter with low clean stumps, and if the trees were not too old an abundant crop of sprouts would rapidly grow up to take their places.

Now that the ravages of the bark disease in the North and those of fire and insects in the South have destroyed so much valuable chestnut growth the lumberman, the forester, the farmer, indeed all thoughtful people are continually inquiring: "Is the chestnut tree doomed? Is this tree, so valuable and familiar, going to become extinct or so rare as to be interesting rather than valuable?"

Of course time alone can finally answer this question, but a careful sifting of the evidence may give us an idea of what the answer will be.

When the grave nature of the blight was realized strong efforts were made to control it. The federal government and several of the states spent large sums of money in the attempt. The federal government twice appropriated \$80,000 to be used solely to study the problem, while the state of Pennsylvania at one time appropriated over a quarter million of dollars to try to suppress it in that state. These efforts have been largely in vain as far as actually checking the disease is concerned. Large scale attempts to control it have now largely been abandoned, and the chestnut has been left to its fate.

It seems, however, that individual shade and ornamental trees may here and there be saved by continued spraying if they have not already been attacked, and that it may be possible to save chestnut orchards in the same way. Small outbreaks of the blight where only a few trees are attacked on a small area far ahead of the main advance of the disease may be eradicated by destroying the diseased trees, as has been done in North Carolina as mentioned below, but even this will not save them in the long run if the main advance of the disease finally comes that way, for when it has obtained a firm foothold in a section there has so far been discovered no way of stopping it, short of destroying all the chestnut trees.

In Pennsylvania attempts are now being made simply to utilize the chestnut timber before it is entirely destroyed. In New England the forester has already crossed the chestnut off the list of desirable trees and is removing it from the forest as rapidly as possible, meanwhile discussing the merits of other trees to be encouraged to take its place.

In the South the situation as regards the blight is not yet so desper-

ate. Its "farthest south" is, so far as is known, in central North Carolina, where in the spring of 1913 a small outbreak was discovered which has since been eradicated by destroying the diseased trees. In Virginia the blight is scattered here and there over the state, but has by no means done the damage which it has further north, due, perhaps to the fight made against it by the state authorities, perhaps to natural conditions. It is thought, however, to be slowly gaining ground there as elsewhere.

In any event the southward progress of the blight fortunately has been much slower than its northward. There is a theory that this is due to the increased percentage of tannin in the southern trees, but it is not definitely proven. Some think that this will cause the disease to become continually less virulent as it advances southward and that it will not invade the splendid hardwood forests of the southern mountains, or at least that its progress there will be much slower and less destructive.

However, the chestnut in the South has other enemies which are destroying it as surely if not as rapidly as the blight itself. Every lumberman in the South is familiar with their work, although he usually confuses it with that of the blight. These enemies have been jointly responsible for the destruction of millions of feet of the finest chestnut timber, and have totally or practically exterminated the tree over wide stretches of country where formerly it was common.

At the beginning of the nineteenth century chestnut was found as far south as Florida and Louisiana and very likely grew along the shores of the Gulf of Mexico.

Recently the writer found a few straggling and dying chestnut trees in southern Mississippi close to the Louisiana state line, in a region far southwest of any recent reports of its occurrence. Survey notes of an old government survey of the region made about the time of the War of 1812 mention corners witnessed by blazes on chestnut trees. In retracing these old surveys recently we could locate the original corners, but no trace of the chestnut trees remained. The old

inhabitants said that in their youth there were many dead chestnut trees scattered throughout the woods, thus proving that at one time the tree was not rare in a region where in recent years it has been so rare as to escape notice.

On the Atlantic seaboard chestnut was found as far east as the coastal plain of the Carolinas, and possibly at no very remote time grew along the shores of the sounds and lagoons which form their inner coast.

On the west, too, the range of the chestnut seems to have once been much wider than at present. There is reason for thinking that it once grew west of the Mississippi in the Ozark mountains of Arkansas, although today it occurs only east of the great river.

Even before the Civil war it was noticed that in certain sections of the South the chestnuts were mysteriously dying off. At first the leaves of a few trees would turn yellow in midsummer and soon fall off. The next year those trees would not put out. In a few years a whole

YOUNG CHESTNUT SPROUTS KILLED BY THE CHESTNUT BLIGHT.

group or hillside would die off in this way, leaving the trunks standing gaunt and lifeless throughout the woods. What few trees managed to escape this first visitation generally succumbed sooner or later, although many years might pass between the death of the main body of timber and the killing of the last straggling trees.

This destruction has now gone on so far that in the South outside of the Appalachian mountains, the chestnut is a rare tree and of no importance to the lumberman. Even in the mountains themselves there are many places where it is now rapidly disappearing. The writer has recently seen thousands of acres along the eastern slopes of the Blue Ridge where this condition is very painfully evident.

The writers who first reported this strange dying off attributed it to various causes such as "worms," root rots or fire. Even today we are still far from certain as to its underlying causes. Whatever they may be the immediate causes are two, possibly three: fire and insects, and possibly fungous diseases.

Ever since the time of the Indians there have been forest fires, but they were then generally so infrequent as to do little harm. With the coming of the white man they became more numerous and severe. The early settlers burned the woods to help clear the land for farms and later under the fancied idea that it improved the grazing. The practice of burning over the woods every year still survives in many portions of the South and is responsible for the destruction of millions of feet of mature timber and young growth.

The chestnut has been the worst sufferer. Other trees have a thicker bark which helps to protect them from the heat of the fire or grow in localities too damp for fires easily to burn. So despite its great sprouting power the chestnut is constantly giving way before these fires. Not only does the fire destroy the trees, it burns up the seeds and so prevents others from growing up to take their places.

A great portion of the chestnut trees are not directly killed by fire but are so weakened that they form attractive breeding places for hosts of insects which sooner or later kill them. Some of these insects also attack and kill sound, healthy trees. The best known and most deadly is the so-called two-lined chestnut borer. This insect is a medium sized beetle and has two light colored stripes down its back. The larva is a long thin whitish "worm" or grub, which bores between the wood and the bark of the living trees. Since a great many generally attack the same tree they soon girdle and kill it. Trees found dying in midsummer such as mentioned above are almost always found to be attacked by this insect.

Some experts have come to the conclusion that this insect together with fire is the chief cause of the death of the chestnut in the South. Others think that climatic changes or perhaps changes in soil conditions have weakened the chestnut to such a degree that fire and insects have been able to get the upper hand. Recently it has been claimed by some that a root rot caused by a fungous disease is chiefly responsible. But as yet no one has said the last word on the subject.

Regardless of the causes there is no way of escaping the fact that in the North most people have given up hope of saving the chestnut; and in the South it has died off over large sections and is now disappearing in the choice hardwood forests of the southern Appalachians, where the tree is at its best and is the most numerous and important in the forest. At the present rate of cutting the supply of virgin chestnut in that region will be exhausted in a generation or less. It certainly looks as if we shall have to find some other wood to take its place when the present crop is exhausted. This is more certain to be the case if the blight does invade the South as it has done the North and East.

We need not, however, fear that the chestnut will become extinct in our own time. But from all evidence it looks very much as if the combination of blight, insects, fires and overcutting would make the chestnut a rare and unimportant tree within a relatively few years—although the suppression of forest fires and the exercise of greater care for the future of the forest in lumbering would undoubtedly increase the number of those years.

How is the destruction of the chestnut going to affect the lumberman? The first effect will be that they will more and more be called upon to dispose of large quantities of chestnut at once to prevent its total loss when the blight or the insects begin to play sudden havoc

with their choice holdings in the southern mountains. It is possible that such a situation might overstock the markets. If this contingency should threaten, it could best be avoided by action on the part of lumbermen's associations to boom chestnut, much as eypress and white pine have been boomed.

This would involve finding new uses for the wood, but from experiments which have been made in Pennsylvania and elsewhere where the blight has left much dead timber to be disposed of, it looks as if these would be minor ones.

After the boom caused by the necessity of cutting the chestnut to prevent its loss is passed there will come a scarcity of the wood. How will it be overcome?

The chief use of chestnut lumber today is in the furniture manufacturing industry, where it is used chiefly as core stock for veneer work. The furniture factories at High Point, North Carolina, and at other places in the Piedmont region of that state use millions of feet annually. The worm holes which are so prevalent in all but a small portion of the timber are an advantage in veneer work since they hold the glue used to fasten the veneer to the core.

With the exhaustion of the mature chestnut in the South, the furniture manufacturers will have exhausted the last virgin timber of the species, and will face the problem of finding a substitute. Such second growth as may be available will not be as desirable as that from the original growth, since it will be in smaller dimensions and will lack the worm holes. What woods will be used as substitutes remains to be seen. The coffin manufacturer will be called upon to solve much the same problem.

Another large use for chestnut is in the manufacture of tannic acid. There are a large number of plants scattered through the mountains of the South, which are devoted to this industry. They will not feel the pinch for material nearly so soon as the furniture men, since there is at present an enormous supply of low-grade timber too poor for lumber but suitable for acid manufacture. Moreover, dead wood yields as much or more tannin than live and is easier to handle; indeed some manufacturers prefer it. One or two plants in North Carolina are being run largely on dead wood, killed by the attacks of the two-lined borer. This industry could probably exist almost on its present scale for several years after the death of the major portion of the chestnut, by using only the dead trees and the young sprouts.

The telephone and telegraph companies will have to find substitutes for chestnut poles now so largely used in the East and South. There are other woods which make good poles, but none so abundant and cheap, particularly for medium sized poles. It is the writer's opinion, that the problem will be solved, partly by the use of western woods, partly by the substitution of other eastern woods, both of which classes will be more and more subjected to preservative processes before being set, and partly by the use of steel poles of the hollow cylinder or of the lattice variety, such as are now used on trolley lines in cities or on high tension electric transmission lines elsewhere.

In parts of the East chestnut has long been an important tie wood, but the use of inferior woods which have been treated with preservatives will probably make up for the loss of chestnut.

We shall probably be obliged to depend on orchard-grown trees for our nuts. Perhaps these trees will be hybrids obtained by crossing the native chestnut with some of its more blight-resistant foreign relatives.

L. P. B.

Because of drouth conditions there is considerable fire danger in the forests of the East this fall.

Pennsylvania and New Jersey lead all other states in the quantity of wood used for making tobacco pipes, and utilize apple wood, French brier, ebony, birch, red gum, and olive wood.

William Penn, in his Charter of Rights, provided that for every five acres of forest cleared one acre should be left in woods. Foresters today maintain that on an average one-fifth of every farm should be in timber.

Pertinent Legal Findings

Right of Innocent Purchaser of Lumber

Plaintiff sold a carload of lumber to the Alexander Page Company under an agreement that ninety per cent of the price should be paid in cash on presentation of invoice and bill of lading. Plaintiff shipped the lumber under a bill of lading which named the Page company as both shipper and consignee, but when the invoice and bill of lading were presented to that company a representative asked permission to hold the invoice and bill of lading while the invoice should be checked. A few hours later the company transferred the bill of lading to the Pioneer Lumber Company, which is found to have paid full value for the lumber and to have acted innocently, and the Page company refused to make any payment to plaintiff. Held, that title to the lumber had not passed to the Page company, since the sale was made subject to a cash payment, which was not made and was not waived by plaintiff, and therefore the Page company passed no title to the Pioneer company, and plaintiff is entitled to recover possession of the shipment. "The general rule is that, where goods are sold upon condition that the price therefor shall be paid upon receipt of an invoice of the goods, the sale is for cash, and the title remains in the seller until the goods are paid for. This is true, although the goods have been delivered to the consignee and sold by it to a bona fide purchaser without notice. * * * The fact that the Page Lumber Company was named in the bill of lading as both consignor and consignee does not change the rule."

Responsibility for Injury to Employee

In a suit against a lumber company for injury to an employe, caused by logs rolling down a hillside when released by burning of supporting props for which the employer was not responsible, recovery was denied on the ground that the fire was the direct cause of the accident, within the rule that an employer is liable for injuries to his workmen only when the same is caused directly by some negligent act on his part. (Oregon supreme court, Chambers vs. Everding & Farrell, 143 Pacific Reporter 616.)

Effect of Timber Deed

A conveyance of all timber standing on land, including trees of a certain diameter and those which attain that size within ten years, gives the purchaser a present interest in all such trees, although enjoyment of the right to cut the latter class is postponed until they attain the required diameter. (North Carolina supreme court, Kinston Manufacturing Company vs. Thomas, 83 Southeastern Reporter 174.)

Damages for Delaying Delivery of Lumber

When a lumber company has contracted to deliver a given quantity of material for use by a contractor in the construction of a certain structure, and has failed to make delivery within the stipulated time, the company being advised as to the purpose for which the material was to be used, the contractor is not prevented from recovering damages sustained through increased cost of performing the work resulting from a delay in delivery of the material, although the contract for sale of the lumber, etc., may have contained a clause to the effect that, on the seller failing to make delivery within the agreed time, he would pay to the contractor "an amount equal to the losses sustained by the contractor, as liquidated damages," and the only liability the contractor incurred to the owner of the structure under the construction contract was a daily penalty for failure to complete the work by a certain time. (Georgia supreme court, J. H.

McKenzie's Sons & Co. vs. Consolidated Lumber Company, 82 Southeastern Reporter 1062.)

"Lumber" and "Timber" Distinguished.—Trade Customs

The word "timber" has an enlarged or restricted sense, according to the connection in which it is employed. It may refer to standing trees or to stems or trunks of trees cut and shaped for use in the erection of buildings or other structures, and not manufactured into lumber within the ordinary meaning of the word "lumber." It does not ordinarily refer to the articles manufactured therefrom, such as shingles, laths, fence rails, or railroad ties. "Lumber" is timber sawed or split for use in building; that is, the manufactured product of logs. Slabs are not included within a statute giving a lien on "lumber and timber" for services in cutting logs. A contract to manufacture timber into lumber may be controlled by a trade custom as to the method of measurement, where no specific method is fixed by the contract. (North Carolina supreme court, McKinney vs. Matthews, 82 Southeastern Reporter 1036.)

Assumption of Risk by Lumberman

A man who is experienced in handling logs in a river assumes the risk of being drowned through overturning of a log upon which he stands in the performance of his duties; that is not a danger against which he is entitled to warning by his employer. (Kentucky court of appeals, Logan's Administrator vs. Sherrill-King Mill & Lumber Company, 169 Southwestern Reporter 707.)

Damages for Delaying Delivery of Machinery

When a machine is sold for use in a lumber manufacturing plant under a contract requiring delivery on a certain day, and the seller is informed at the time of the making of the contract that the buyer would suffer loss of profits in being prevented from operating his plant, the seller is liable for all loss of such profits which is directly attributable to failure to make the delivery within the required time. (Kentucky court of appeals, Fairbanks, Morse & Co. vs. Carson-Muse Lumber Company, 169 Southwestern Reporter 731.)

CHRISTMAS LETTER TO THE AMERICAN SANTA CLAUS

Implement Dimension Stock

Next to certain items in box factory stock, vehicle and implement dimension stock was the first thing on the lumber list to be enlivened as a direct result of the war in Europe. This was the result of an active demand from abroad for implement stock and also for wagons and trucks in this country.

Those who were prepared to furnish on short notice specific dimensions in implement stock are benefited most from this call, and the indications are that it will be a good winter in practically the full line of vehicle stock. Perhaps an exception should be made of the dimension stock used by the makers of harvesters and other purely agricultural machinery. This trade is suffering considerably because of the war, especially in the export branch. Some of the makers of plows and planters for the cotton section find business slow, so naturally there will not be very great activity in this division until the situation has cleared up and trade is resumed again in a normal way. With this exception, however, the wood stock trade has shown signs of considerable revival and part of it has come directly through the placing of extensive orders by warring nations. This includes orders for everything from spokes to tongues.

The demand for specific dimensions in wood stock is suggestive of possibilities in the way of more attention on the part of millmen to the making of dimension stock. It is a reminder that for several years some of the millmen, who in times gone by have made a feature of dimension stock, have been drifting away from it and cutting their logs into planks anditches and selling it in this form instead of in the form of specific dimensions.

This cutting planks anditches simplifies the millwork and also makes it practical to increase the capacity, to put more logs through the mill in a given period of time. This is perhaps one reason why the millmen have followed that course. On the other hand, that is one of the things which helped to accumulate a surplus in many hardwood lines. If the mills, instead of running full capacity and making planks anditches, had taken more time and converted their vehicle wood into specific dimensions, there would have been less surplus accumulation and they would have been in better shape to supply the present demand for vehicle stock.

The present situation in the vehicle wood trade is a strong argument for specific dimensions, for the millman to get busy on the subject of standardizing and cutting to specific size as much as possible. There has never been a time in the history of the industry when there was more active inquiry for specific dimensions all the way from stock to make small handles and spokes up to the heavier material for wagons and trucks. This call indicates a willingness on the part of the consuming trade to buy in specific dimensions rather than to buy lumber from which to cut the dimension stock. With a fair share of the consuming trade taking this attitude it should be a comparatively easy matter for the manufacturers and consumers to get together and do more standardizing and listing of the various specific sizes.

There are two splendid arguments in favor of the dimension stock idea. One of these is that it makes for economy in timber, for closer utilization at the mill and for using up the timber to the best advantage in every way. The other argument, and one that should appeal strongly right now, is that it gives the sawmill more work to do in converting the same quantity of timber. That is what sawmills have needed so far this winter more than anything else—more work to do. Many have had to close down and let their employees shift for themselves, and when it comes time to start up again may find it difficult to round up a satisfactory crew. Anyway if the crew is strange and new to the work there will not be the same order of efficiency obtained from an experienced crew at work continuously.

The cutting of dimension stock, while it calls for additional equipment at times, may be affected in a sort of compromise way. The sawmill can be used for doing part of the work, and by making some additions in the way of rip saws and cross-cuts it should be practical

to keep mills moving along cutting less timber and yet turning out more value in proportion in the finished stock.

After reviewing the situation all around one feels like urging upon the hardwood sawmill men earnest consideration of the dimension stock business, not only the vehicle dimension stock, but all the possibilities in the dimension stock line which give promise of more work and better returns from the same amount of timber.

Lumber Business in Hawaii

A report on the lumber business of the Hawaiian islands, by Franklin H. Smith, has been published by the Bureau of Foreign and Domestic Commerce at Washington. Those islands deal principally with the Pacific states and procure most of their lumber and other forest products from California, Oregon and Washington. Some trade is carried on with the eastern half of the United States, but hardwoods make a rather poor showing in the export business from this country to those islands. A summary of those portions of the report which are of general interest, particularly to the hardwood trade, indicate that there is room for further development.

For the year ending June 30, 1914, the value of forest products imported was \$1,383,222. This amount is smaller than for any one of the four preceding years. The shipments from the United States represent almost the total imports of lumber into Hawaii. The exceptions are the few dollars worth of reeds, rattans and bamboos imported by the Chinese particularly, and a negligible amount of staves used by the Japanese for containers for salted fish, rice, and native drinks.

Only one sawmill is in operation in the islands. The mill is that of the Hawaii Hardwood Company, at Pahoa, on the island of Hawaii. Here is cut a limited quantity of ohia, a dense hardwood, which is manufactured into railroad ties, vehicle stock, flooring, paving block, and lumber that is principally used for interior finishing purposes. The anomaly is presented of this mill's product in the shape of ties being shipped to the mainland for the Santa Fe Railway Company, while the Hilo Railroad Company, over which road the ties are hauled from Pahoa to Hilo for shipment, imports redwood ties from California for its own line. Ohia flooring is quoted in Honolulu at \$80 per thousand feet board measure for $1\frac{1}{2}$ -inch by $2\frac{1}{4}$ -inch face, while 1" x 4" stock in lumber brings \$75 and 1" x 10" and 12" as high as \$85 per thousand feet.

One other species which is cut in limited quantities and which in a measure may be said to compete with lumber from the mainland is koa, another dense hardwood, occasionally referred to as Hawaiian mahogany. This is an acacia, found chiefly on Hawaii and Maui. Natives cut the timber and find a market for the logs and gnarled pieces. It is manufactured principally into furniture and takes a beautiful polish. It is also made into many small articles which are sold as souvenirs.

Wood has been found the most desirable building material on the islands, though others are used. Many of the large sugar plantations import lumber direct, without giving the orders to middlemen.

Hardwoods are used only to a limited extent. Only three species are imported—oak, ash and hickory. In lumber the grade bought is No. 1 common. Since the hardwoods are desired almost exclusively for the building of new or repairs to old vehicles, dimension stock is largely specified. Probably not more than fifteen cars a year find a market in the islands. The lumber is sometimes shipped from the assembling points east of the Missouri river to San Francisco, but more often it is bought in the eastern markets and shipped from New York or Philadelphia by steamer in parcel lots. It retails at from \$85 to \$100 per thousand feet in Honolulu.

No industries of any size exist in the islands that use lumber exclusively as a raw material. Numerous small furniture-making shops are to be found in the cities and larger towns, most of which are conducted by aliens, for which lumber is bought locally and in decidedly small lots. Into this class of manufacturing goes a quantity of ohia, the native wood, as well as some koa.

Proposed National Forest Changes

David F. Houston, secretary of Agriculture, in his report for the fiscal year ended June 30, 1914, recommends a change in the methods of administering the national forests in undeveloped sections, so that they will yield at once revenue that can be applied to local development which will further assist communities and aid in the settlement of the territory. Under this plan the department, instead of waiting until timber is actually sold before the unsettled counties gain any revenue from this form of the public domain, will, if Congress grants the necessary authority, underwrite its proportion of expenditure for local improvement, especially for road construction, and charge this against the counties' shares of timber sales when the timber is opened for commercial cutting.

In regions where timber is the chief income-producing resource absence of demand for it often works a serious hardship upon those who have entered the region as the advance guard of civilization and are seeking, in the face of many difficulties, to establish homes. There are counties in which a sparse local population of pioneer settlers find themselves surrounded by a wilderness largely consisting of national forest land, which is almost idle so far as any form of present use is concerned. In other words, a great, if not the greatest of the potential sources of wealth in such counties, held in trust by the government for the benefit of the public, not merely contributes nothing now to the upbuilding of the communities which will give value to the forests, but actually adds to the burden which these communities must assume. That it should be made to serve the local as well as the national public welfare has been definitely recognized in the provisions of law for the use of thirty-five per cent of all gross receipts from the forests for local public purposes.

To carry more fully into effect this already established principle a further step should be taken. It should not be necessary to wait until the period of hardest struggle is past before these public resources begin to assist local development. Before the national forests begin to yield large incomes, as well as after, they should be made to participate in the work of building up the country and giving value to all its resources.

BETTER ROADS NEEDED

The first need of the public in undeveloped regions is for more and better roads. Without them the struggle of individuals to gain a foothold is much more difficult, while isolation from neighbors and the outside world means meager educational opportunity, a lack of comforts, and conditions unfavorable to community life. A road system, however, constitutes a capital investment which a handful of settlers must make a little at a time. When their roads must be built largely through national forest lands, which pay no taxes, their case is much more difficult. In such regions the secretary of Agriculture should be authorized to make a study of the local conditions and to gather all the data necessary to formulate a plan for public-road development based on local needs. On the basis of the showings of fact regarding the value of the government's property, its potential income-yielding capacity, and the needs of the public, Congress should be asked to appropriate for the construction of specific projects recommended by the secretary of Agriculture. The cost of such road construction by the government should constitute an advance of the amounts which the forests would later make available for local use. In effect, therefore, the roads would become an obligation upon the forests, to be extinguished as their resources come into commercial demand."

HOMESTEAD CHANGES PROPOSED

The secretary recommends changes in the system of homesteading, and suggests the wisdom of releasing certain parts of the forests by exchange of property with the states. An important part of the forest problem is to get the right line drawn between farm and forest. Under private ownership considerations enter which do not always lead to the best use of the land. On the national forests the question is determined by a careful study of what the land is best fitted to produce and what the public most needs. Agricultural development is provided for either by excluding from the forests land

chiefly valuable for other than forest purposes or by listing land for settlement under the forest homestead act. The work is carried out through land classification, which was aggressively pushed last year. The elimination made or determined upon totaled over 2,000,000 acres, while systematic classification was conducted on 100 of the forests, and over 280,000 acres of land were listed for settlement under the forest homestead law. The area in the forests at the close of the year, exclusive of land not the property of the government, was slightly over 165,000,000 acres.

There is need for similar classification work outside of the national forests wherever the public domain is timbered. There are still many areas which should be added to the forests. Wherever the land will have largest permanent value through use for forest production it should be held in public ownership. Timbered portions of the public domain are now unprotected against fire and trespass and are often a source of danger to adjacent lands.

There is also need for legislation to permit the consolidation of national forest holdings through land exchanges with states and private owners. Some of the forests contain a great deal of land which was acquired from the government before the forests were established. Exchanges of land on the basis of equal values would be very advantageous to the government, since the cost of administration and protection would be materially reduced.

TIMBER SALES

The report outlines the policy of the department regarding timber sales in the national forests. In its handling of timber sales on the national forests the department is confronted with a situation radically different from that which obtains with respect to the grazing. While almost all the range on the forests is in demand, most of the timber is not. To a large extent development work here means so handling the timber that it will be an important factor in opening up the country. Wherever and whenever general business and market conditions make it possible to sell large bodies of now inaccessible timber, the aim is to offer the timber on terms which will tend to increase transportation facilities, promote settlement, and build up permanent communities. Where timber can be sold the benefits of government management of the forests as public resources are apparent now. Where, however, the timber is not in present demand a difficult situation sometimes exists.

It has been urged that, with the vast supplies of virgin national forest timber, the government should greatly increase its sales by lowering the price asked for stumpage. To the extent that such a course had any effect at all it would be, in the long run, an effect unfavorable to the public interest. Upon the greater part of the timber it would have no effect, because no manufacturer could, under present conditions, afford to cut the timber at any price. Where timber is thus not in demand because still inaccessible, as a rule the possibility of marketing it depends on the advent of a period of greater activity in the general lumber trade. When, as at the present time, lumbermen are forced by general market conditions to curtail output, the department can not expect to make many large sales. Nevertheless, it is wise even in such times not to cease offering large bodies of timber on terms which may attract purchasers, and this is being done. At the same time all possible effort is given to develop small sales for the supply of local needs, and sales to industries which require wood for special purposes, since sales of this character provide a fairly steady market for national forest stumpage, even when the general market is depressed.

In the section dealing with forestry the secretary points out that the forests have passed through an unusually dry and dangerous summer without serious fire damage. He indicates that the present emergency fund of \$100,000 for fire protection of one billion dollars of public property is inadequate even in ordinary seasons. In discussing the recreational use of the forests, which he holds to be the chief of the secondary uses, he urges that the department should be enabled to grant term leases to persons wishing to use the land for summer homes or hotels.

Southern Traffic Developments

Further suspension has been ordered of the proposed withdrawal of the stopping-in-transit privileges on logs, rough staves and stave bolts at Alexandria, La. The tariff making this provision has been suspended until March 30.

Tariffs of the Missouri Pacific and St. Louis Southwestern providing for the cancellation of joint through commodity rates on lumber in carloads from points in Arkansas and other states to points in Central Freight Association and Trunk Line territories have been suspended until June 13. A former order had suspended the tariffs from August 15 until December 13.

A complaint was filed last week by the King Lumber and Manufacturing Company versus the Chicago, Milwaukee & St. Paul, in which it is claimed that excessive charges were assessed on sawmill machinery shipped by the Berlin Machine Works at Beloit, Wis., to the mill of the company at Nocatee, Fla.

A complaint submitted to the commission last week by the W. E. Heyser Lumber Company of Cincinnati is typical of the experience of many companies, it is said. A car of lumber was shipped from Quick, W. Va., consigned to shippers' order at Detroit, Mich. Transit Railway delivery was specified. Almost at the time of the departure of the car, the agent of the Transit Railway in Detroit was instructed to deliver the car to the Yeomans-Diver Company. The car reached Detroit via the Pere Marquette, instead of the line specified. The Heyser company was notified and information as to delivery requested. The company advised the Pere Marquette agent the name of the consignee and asked that excess charges not be assessed, as the car had been misrouted. Two weeks later the company was advised that the car remained in the Detroit yards and disposition was requested. Again the information was forwarded. Three weeks passed and again delivery instructions were requested. This time delivery was made. The Heyser company asks reparation for the demurrage charges.

Reparation has been ordered in the following cases: C. E. Ferguson Sawmill Company versus St. Louis, Iron Mountain & Southern et al. The defendants are required to return \$583.27 before December 15, with six per cent interest. The refund was due to an error in the eypress lumber rate.

Aberdeen Lumber Company versus New Orleans & Northeastern; unreasonable rate, rough cottonwood lumber from Naples, La., to Moline, Ill.

Trinity Lumber Company versus Missouri, Kansas & Texas et al.; unreasonable rate on lumber, Atmar, Tex., to Evanston, Ill.

Midland Lumber Company versus Yazoo & Mississippi Valley; unreasonable rate, gum lumber, Midnight, Miss., to Cairo, Ill.

Tremont Lumber Company versus Chicago & Eastern Illinois; unreasonable rate, lumber, Jonesboro, La., to Carlisle, Ind.

Taylor & Crate versus Yazoo & Mississippi Valley; unreasonable rate, gum lumber, Hincheliff, Miss., to West Toronto, Canada.

Crescent Lumber Company versus Illinois Central; unreasonable rate, Gladys, Miss., to Whitley, Canada.

Pee Dee Lumber Company versus Atlantic Coast Line; unreasonable rate, Pee Dee, S. C., to Pottsville, Pa.

Tennessee Tie and Timber Company versus Louisville & Nashville; unreasonable rate, ties, Tudor, Ky., to Hume, Ill.

Waterman Lumber and Supply Company; unreasonable rate, lumber, Waterman, Tex., to O'Neil, Neb.

Trexler Lumber Company versus Toledo, St. Louis & Western; unreasonable rate, lumber, Prentiss, Miss., to Utica, N. Y.

Salzer Lumber Company versus Northern Pacific; unreasonable rate, edging, Walker, Minn., to Robinson and Wing, N. D.

Weed Lumber Company versus Southern Pacific; unreasonable rate, box shooks, Weed, Colo., to Phoenix, Ariz.

Estabrook-Skeele Lumber Company versus Chicago & Northwestern; unreasonable rate, lumber, Waheno, Wis., to Kaukaee, Ill.

Tri-State Lumber Company versus Baltimore & Ohio; unreasonable rate, dry oak, Albright, W. Va., to Kyser, W. Va.

J. W. Darling Lumber Company versus Louisiana Railway and Navigation Company; unreasonable rate, cottonwood lumber, Wilhelm, La., to South Bend, Ind.

D. T. Crockett & Co. versus Seaboard Air Line; refunds and waiving of undercharges, lumber, Cates Mill to Capitola, Fla.

Hanks Lumber Company versus Richmond, Fredericksburg & Potomac; refund and waiving of undercharge, lumber, Penola, Va., to Wall Kill, N. Y.

Singer Sewing Machine Company versus Chicago, Rock Island & Pacific; unreasonable charges, lumber, Olneyville, Ark., to South Bend, Ind.

Wood & Skilton versus Southern Railway; unreasonable rate, lumber, Cleveland, N. C., to Cape Charles, Va.

Dembevie Lumber Company versus Pennsylvania Railroad; unreasonable rate, lumber, Allenhurst, Ga., to Jersey City, N. J.

The Meaning of "Solid"

A recent lawsuit in a county court in England turned upon the meaning of the word "solid" when applied to furniture. A customer, it is stated, ordered a solid mahogany bedroom suit and agreed to pay \$61.75 upon delivery. He refused to accept the furniture, claiming that all the wood in it was not mahogany, consequently it was not solid. When the case came to court the maker of the furniture admitted that some of the inside parts were not mahogany, but he insisted that the articles conformed in every way to what in trade is called solid mahogany. The court's decision agreed with him.

Custom rules. If in ordinary business it is usual to apply a certain name to an article of a particular kind, the article may be legally sold under that name, without conforming to exact definitions.

The manufacturers of articles of mahogany and other expensive woods in the United States, especially caskets, fixtures, and fine furniture, frequently observe the letter as well as the spirit of the contract when they use the word solid. The casket maker may be taken as an example. If a customer asks for a solid mahogany article, he is apt to get it; but that does not mean that all the wood is of as high class as that which appears on the outside. There are different grades of mahogany. The "sound wormy" is perforated with holes in large numbers and of various sizes, from a knitting needle to a lead pencil. This is the work of the teredo in tropical waters. Such wood is not suitable for outside work, but it is excellent for cores over which to glue veneers.

The hidden parts of the article may be of the perforated mahogany, and the covering consist of veneer of high grade. Cost is thus kept down, and yet the article contains no wood except mahogany. The same process may be followed when other woods are used. Solid articles may have fine figured stock outside, and plain and cheaper grades for the hidden parts.

Practically all good furniture, if the pieces are of large size, is built up. Table tops are of sheets of veneer glued upon cores of other woods. Solid pieces of that size would warp and check, but the built-up stock holds its shape. It is not customary to have cores of the same wood as the outer surface, yet that process is followed where the customer insists on solid wood. Massive table legs are occasionally made of expensive English oak, if the customer insists; but they are cheaper and better if a core of white pine, chestnut, or yellow poplar is within, and the covering only is of the expensive oak. If the customer objects to having a cheaper wood within, the maker has been known to build up the legs of the table with oak boards glued firmly together, and do the turning afterwards. That is done by the maker because a built-up piece is less liable to check than is the solid stock, and the customer gets the "solid" English oak table, legs and all.

It is evident that "solid" used in this sense does not mean that each part is one piece, but means only that the whole article is of one wood. A suit at law in this country would probably result as in England if custom were followed in defining the word "solid."

B. W. LORD, DANVILLE, KY., PRESIDENT

CHAS. H. BARNABY, GREENCASTLE, IND., A. E. GORHAM, MT. PLEASANT, MICH.,
SECOND VICE-PRESIDENT

FIRST VICE-PRESIDENT

Veneer and Panel Annual

The National Veneer & Panel Manufacturers' Association convened for its annual meeting at 10 o'clock Tuesday morning, December 8, at the Auditorium hotel, Chicago, with a full attendance at the opening session. President B. W. Lord was in the chair and opened the official business with a short discussion of the program offered, with an appeal that all members give their attention through the entire sessions in order that as much might be accomplished as possible.

The roll call was followed by the president's address. Mr. Lord did not have a formal address prepared, but spoke earnestly in behalf of the need of co-operation under present conditions, suggesting that the greatest good to business as a whole could be accomplished by united efforts through the association as a medium. He suggested the advisability and fairness of association members trading among themselves as much as possible, and then suggested that owing to the fact that the scope of the association's work has been changed and enlarged very materially since the organization was first formed, it would probably be necessary to reorganize in the near future. He then suggested the attention of the members to that probable necessity.

The report of Secretary E. H. Defebaugh was read by the assistant secretary, Howard S. Young, in the absence of Mr. Defebaugh. He raised the question as to whether or not veneer men are endeavoring as generally and as effectively as possible to educate their consuming customers to the best adaptability of certain kinds and grades of veneer of which they are specific users. He maintained that through a close study of consumer's requirements great good can be accomplished to both parties in any transaction.

The report of the treasurer showed a comfortable balance in the treasury.

J. W. Roche, traveling representative of the association, then read a paper on the "Utilization of Waste," which is summarized in the following paragraphs.

We, as a nation and as a business people, are woefully deficient in handling waste, and theoretically the problem seems solvable. For instance, chemically considered, I find there is only a slight difference between a pile of sawdust and commercial alcohol. The only difference is the rearrangement of the atoms; both are made of the same ingredients, carbon, hydrogen, and oxygen, and the difference between the alcohol and the commercial acid is very slight. Fuel oil, I find, is a carbohydrate. Now, if some of you people want to make a fortune, find the process of changing your waste into a fuel oil. Theoretically, it ought to be easy,

as you have exactly the same ingredients. Theoretically, I have presented some of the problems that have confronted business men in general.

The question as it relates to the veneer man in the handling of waste, as it is being done, is first: can it be construed to mean much or little. For example, what constitutes waste? Is it the material disposed of by burning or by any other method—material that is regarded as useless? Or, does it merely apply to the method, manner, or mode of conveying the same to the boiler room? If it refers to what constitutes waste, the different mills have different views regarding it. For instance, some mills burn material as wide as five or six inches. Other mills utilize that by cutting it to small dimension sizes for boxes. Some send this small stock, cut in sizes, to cotton or woolen mills. Again, others work their waste into covers for grape baskets, four and eight pounds. Also, mills that work up into baskets and berry baskets the material called waste, claim that a large share of their profit comes from what a great many mills burn. On the other hand there are mills which contend that it doesn't pay to handle it. Now, the different mills have different plans for conveying their waste to the furnace. Some use the most crude way imaginable. Men pick it up from the floor, place it in a wheelbarrow or a factory truck with a large box built on it, and wheel or push it to the fire room. It usually takes two men to do the work, and for a radius of at least ten feet from the machine there is a continual litter. Others have large boxes, oblong in shape, with long strips bolted to the side, and projecting perhaps two feet from each end for handles. One box placed at the front of the machine in which the bark and peelings are placed, and one on the other side of the machine for the log trimmings and scraps as they come from the knife, and one at the clipper for the trimmings. As these are filled, two men carry them into the boiler room, empty them and return them to their places. No extra help is engaged for this work. The regular machine crew does it, and it doesn't seem to delay the work any. Some mills have a very elaborate plan, a system of carriers or conveyors, that traverse the building, one depositing into the other, until it lands in the boiler room where it is up to the fireman to take care of it. Others have this waste by a system of conveyors deposited at what is known as the "hog," which everyone is familiar with. This waste is fed into this hog which cuts it fine enough for a fan to blow it into the boiler room and fed into the arches as well. I have seen some mills that were absolutely clean, neat and orderly, and others which were not, not only in appearance, but couldn't help but prevent the mill running to its capacity. There is no question in my mind, after seeing the different methods used, but that the conveyor system is the most economical and most complete. I mean the conveyors that are placed below the floor because all waste can be dropped into them as fast as made.

The subject was then presented to the convention by the president for discussion. D. E. Kline suggested that it was easy enough to provide mechanical means for economically handling waste, but what all are after is some logical means by which it can be disposed of elsewhere with profit. President Lord said that up to a few months ago when the decreasing price of cordwood made it impossible to buy

that product more cheaply than veneer waste, he had disposed of all of his poplar and gum waste in bulk carlots to pulp manufacturers and realized a net profit, deducting the cost of coal necessarily purchased, of about \$45 a car, which made a total profit of from \$300 to \$400 a month. The question was raised as to whether this method could be utilized by other members cutting other woods, and it was generally conceded that it was a logical outlet for only certain kinds of wood.

The discussion brought out the general opinion that it is very difficult to analyze the question of utilization of veneer waste closely as one kind of waste can be marketed whereas another kind of the same general form but of a different wood cannot, and also that a mill located in one locality can, because of favorable freight rates, market its product whereas another must necessarily use it for fuel.

President Lord said that during present conditions of low prices in cordwood it is impossible to consider marketing waste for pulp, and suggested that members bear in mind that it can ordinarily be marketed on freight rates of from five to six cents during more normal times.

F. F. Chandler of Indianapolis, manufacturer of engines and boilers, read a most interesting and instructive paper entitled "Three Dozen Ways for Gain," in which he analyzed the possibilities of saving in innumerable ways in power plants. Mr. Chandler maintained that no one part of any factory is given less consideration than the power plant, and also that in no other factor in manufacturing institutions is there more room for money saving applications. Mr. Chandler's paper is too valuable to run in brief form and we will carry it in full in the December 25th issue HARDWOOD RECORD, together with questions and answers brought out in the discussion which followed.

Following the reading of Mr. Chandler's paper the meeting adjourned with a luncheon, which was served in the convention room.

Afternoon Session

Harry Hunter of the Hunter Dry Kiln Company, Indianapolis, Ind., was the first speaker of the afternoon session. His paper is given in full in another part of this issue of HARDWOOD RECORD.

A discussion of the drying problem and Mr. Hunter's special process followed.

A. E. Gorham, chairman of the inspection and grading rules committee, read a list of changes recommended by that committee, based on replies received from an inquiry sent out by the secretary. After a lengthy discussion it was moved that the whole matter be referred to the individual clubs for settlement, and that their findings be sent to the secretary and adopted as the rules of the association.

The chief controversy in the discussion was developed over the question as to the grading of log-run rotary veneer, and it was evident that there is a very hazy idea on this grade of stock. There seemed to be a question as to whether "log-run" constitutes really the run of the log exclusive of culls, or whether it represents the specific requirements of certain users of rotary stock. It was recommended that it would be good policy to get away from the log-run method of sales altogether, in order to clarify a very cloudy issue. No action, however, was taken on this recommendation.

The discussion of the grading proposition was interrupted in order that the members might enjoy an address by E. F. Trefz, field secretary of the Chamber of Commerce of the United States of America. Mr. Trefz has established his reputation among the lumber associations, and this was the first opportunity the veneer manufacturers had of listening to him, and most of them expressed their opinion of his efforts by stating they believed it was worth a trip to Chicago simply to hear him speak.

Mr. Trefz's talk covered economic developments throughout the country, and the dependence of the nation upon what is commonly known as "big business." He summarized the conditions leading up to the declaration of war in Europe, and expressed himself as believing that this country will be benefited most through its making us realize our failings. The most marked effort will be the bringing of business and government more closely in sympathy and contact with each other, to the end that the problems of business men will be met intelligently and fairly by the national and state legislatures.

Mr. Trefz sounded a note that was distinctly encouraging, when he said that business cannot get worse, nor can it stand still, but will unquestionably gradually become stronger until at the culmination of the war we will have reached a period of prosperity which will have been unprecedented. He also expressed himself convincingly on the probable stability of that prosperity when it comes, saying that it cannot fail to endure for at least twenty years.

President Lord brought up the question of the appointment of a delegation to the national chamber of commerce convention, which will take place at Washington in February. On motion, this appointment was left to the chair.

Similar action was taken on the appointment of delegates to the pending meeting of officers of lumber associations which will be held at the La Salle hotel, Chicago, December 17, for the purpose of outlining a plan for successfully combating wood substitutes.

President Lord introduced H. G. Herget of the Pekin Coöperage Company, Pekin, Ill., who has been active in traffic matters in connection with coöperage shipments. Mr. Herget outlined the work being done by the Coöperage Traffic Bureau, an organization formed originally by the tight coöperage manufacturers and recently adopted by the stove and heading manufacturers and slack coöperage interests for the furtherance of the interests of these various groups of business men in their traffic controversies.

He said as the association now stands it has not sufficient membership to enable it to carry on its work as successfully as it might had it more financial backing, and suggested that the veneer association look into the matter of joining this as a body or individually in order to have some central representation before the proper bodies in the settlement of questions of this character.

The matter was placed in the hands of the railroad classification committee, and the same motion carried instructions that that committee get in touch with the Uniform Classification Committee, which is maintained in Chicago, for the purpose of taking up with them the classification of veneers.

On motion the meeting then adjourned until 6:30, at which time the members were requested to gather for a dinner, and in order to close up the remaining matters before the business session.

More than one hundred members and guests sat down at the dinner which was provided in the south rooms of the Auditorium hotel for the evening.

It had originally been the intention to finish the business sessions following the dinner, but it is usually a pretty difficult proposition to mix business with such functions, and President Lord very gracefully slid over the original plans and devoted most of the time to calling on various individuals, who responded in a variety of veils, humorous and serious.

About the only business transacted was the report of the resolutions committee and the election of the officers. Resolutions were adopted on the death of William Seiber of the Central Veneer Company, Huntington, W. Va., and thanks to the various speakers who had read papers before the day's session.

The nominating committee recommended that all of the officers who served during the past year be re-elected. The action taken on this recommendation was unanimously favorable. The officers are:

PRESIDENT, B. W. Lord, Danville, Ky.
 FIRST VICE-PRESIDENT, A. E. Gorham, Mount Pleasant, Mich.
 SECOND VICE-PRESIDENT, Charles H. Barnaby, Greencastle, Ind.
 THIRD VICE-PRESIDENT, L. P. Groffmann, St. Louis, Mo.

E. H. Defebaugh tendered his resignation as secretary of the association, and Howard S. Young of Indianapolis, Ind., formerly assistant secretary, was duly made secretary of the association.

E. H. Defebaugh was elected to the office of treasurer.

The executive board made one change, H. B. Sale of Fort Wayne, Ind., filling the vacancy made by the withdrawal of R. C. Dayton.

Applications for memberships were filed by the following who were duly accepted:

Van Veneer Company, Malvern, Ark.
 Indianapolis Sawed Veneer Company, Indianapolis, Ind.
 Niekey Bros. & Bass, Memphis, Tenn.
 Stinson Veneer & Lumber Company, Memphis, Tenn.
 C. L. Willey, Chicago, Ill.

Some New Kiln-Drying Thoughts

Editor's Note

The following paper was read before the annual meeting of the National Veneer & Panel Manufacturers' Association, held at the Auditorium hotel, Chicago, December 8 and 9, by Henry Hunter of the Hunter Dry Kiln Company, Indianapolis, Ind. It contains some suggestions that will be valuable to *HARDWOOD RECORD* readers.

It is not my intention to take up the time of this meeting with a long discussion of any theoretical drying system. You gentlemen are interested in what can be done and has been done rather than what might be done. With this idea in view, what I shall have to say will be based upon observations made under ordinary factory conditions and actual tests made under these same conditions. I shall take up briefly the troubles resulting from improper drying, with their causes and the conditions which produce them, following this with a brief description of the conditions under which successful drying can be accomplished and these troubles eliminated. I have incorporated in this paper the results of a series of tests made under the conditions which I shall describe and which will illustrate better than any argument what is possible under correct drying conditions.

The troubles resulting from improper drying, which affect the panel manufacturers and a part of which are common to all manufacturers of wood products, are blistering of veneer, veneer shrinkage, opening of joints, warping, case-hardening, honeycombing and checking. As you all know, case-hardening, honeycombing and checking result from excessive heat or lack of moisture or from both, the surface drying first and preventing the escape of moisture from the center of the stock. The other troubles are caused by under drying. I do not intend to convey the idea here that improper drying is always the cause of all these difficulties. A part of them may, at times, be caused by other things regardless of how the product is dried. But I do say that where the stock has not been properly dried some of these troubles will result.

Unsuccessful drying is the result of improper conditions as to heat, humidity and circulation in the drying chamber. These conditions may be all or some one or more of the following: insufficient humidity, insufficient circulation, excessive heat, lack of uniformity as to heat, humidity and circulation in all parts of the kiln, and the variation of these conditions from time to time during the drying period. While it is perhaps not possible to dry each individual piece of wood in the same degree, it is certainly true that approximate uniformity can be attained only where the conditions are uniform throughout the drying chamber. The temperature cannot be permitted to vary. Likewise the amount of moisture must be uniform throughout the room. There must be a continuous and rapid supply of fresh air to all parts of the kiln and the prompt removal of the air after it has been used. The problem, therefore, is first to produce these conditions, and second, to control them once they are produced. To produce the conditions as to heat and humidity, it has been found best to heat the air to the desired temperature and humidify it to the proper degree before it is permitted to enter the drying chamber. This, of course, cannot be done where the radiation is inside the drying room proper. There are additional objections to having the radiation in close proximity to the drying product. The best results in rapid and uniform circulation can be obtained, I believe, by having both the intake for fresh air and the outtake for impure air on the floor line. In this way the warm air rises rapidly and passes to all parts of the room, while the cooler impure air sinks to the floor line and is removed. This insures a constant and ever changing supply of fresh air, heated and humidified to the proper degree, and brings it continuously into contact with the work to be dried. The control of circulation as well as that of heat and humidity should be taken care of automatically.

I desire at this point to emphasize the importance of humidity in any drying system and that there must be some provision made for producing and controlling it. The amount of moisture naturally in the air is uncertain, varying with the outside conditions, and cannot be depended upon. There must be some method for producing it, but any arrangement which provides for it without accurate control and regulation will not produce results. Moisture in the drying air

is responsible for the open pore and no wood product can be successfully dried without it. Without an open pore, the center of the stock cannot be properly dried while the outside case-hardens and honeycombing sometimes results. On the other hand, stock dried with open pore can be more easily worked and presents a better surface for the adhesion of glue. Veneer and cut-stock will be more pliable, flatter, and will have good color. The stock can also be worked in less time, with less waste and less expense.

With the drying conditions regulated and controlled as already indicated, lumber can be best dried at a temperature of 140 degrees F, with the humidity held at 57 to 63 degrees. In drying panels, the temperature should not be so high, 120 degrees being the limit.

The following results were obtained from the tests made in a factory which was having most of the troubles above enumerated. They were obtained under the conditions described as being essential to proper drying. The first test was upon a number of panels taken from the glue room. The first moisture test on the core stock showed a variation in moisture content of from 3 to 14 per cent. The first moisture test on the veneer and cross banding showed from 6.7 to 8 per cent of moisture. After being re-dried under the above described conditions for fifteen hours, the core stock showed a variation of from 3.5 to 4.5 per cent in moisture and the cross banding and veneer showed from 2.9 to 5 per cent. After the panels were laid, they weighed 65 pounds 4 ounces. After being dried for 22 hours, at 120 degrees, the weight was 63 pounds 8½ ounces, a loss of 1 pound 11½ ounces or an average loss to the panel of 3.4 ounces. After the panels were dried, they showed a moisture content of from 4.7 to 6.7 per cent, an average of 5.75 per cent.

A test of twenty oak boards taken from the tempering shed to be used as core stock, showed a moisture content ranging from 2.9 to 19.4 per cent. Eighteen maple boards taken at the same time, showed a variation of from 3 per cent to 6.7 per cent moisture content. These boards were taken from the same piles at the same time and had all been kiln-dried. After being re-dried for thirty-six hours at 140 degrees, the oak showed a variation in moisture content of from 2 to 3.8 per cent, an average of 2.7 per cent. The maple boards showed a variation of from 1 per cent to 3.6 per cent, an average of 1.6 per cent. This stock was worked up into six 5-ply oak panels, size 18x33, and six 5-ply mahogany panels of the same size. After being laid, the oak weighed 57 pounds 4½ ounces and the mahogany 52 pounds 15½ ounces. After drying, the oak weighed 55 pounds 4 ounces and the mahogany 50 pounds 13½ ounces. The loss of moisture on the oak was 2 pounds ½ ounce, an average of 5.4 ounces to the piece. On the mahogany, the loss was 2 pounds 2 ounces or an average of 5.6 ounces to the piece. The moisture content in the oak after drying was 7 per cent, in the mahogany, 7.1 per cent.

These results speak for themselves. The variation of the moisture content of stock dried under improper conditions, and the uniformity of the same when dried under correct conditions is apparent. The danger of having part of the work come through in good condition, and a part of it go wrong, is eliminated. It makes your drying system certain and dependable. There is no more reason for guess work in your drying than in any other department of your factory. Create the proper drying conditions and control them. Pile your stock properly, so as to prevent the forming of pockets, and the obstruction of circulation. Test your stock for moisture content before placing it in the kiln. Treat it accordingly and test it before removing. Learn your factory conditions. Do not expect your stock to remain dry after leaving the kiln when your shop conditions are wrong. With correct factory conditions and the application of the above described principles in your drying department, your drying troubles will be greatly lessened, if not entirely eliminated.

Lumber Used in Manual Training

One of the most impressive features of the address of Irving K. Pond, a Chicago architect, before the National Lumber Manufacturers' Association on the subject of "The Merchandising of Lumber," was the suggestion of the possibilities of manual training in developing love and familiarity with wood among the boys of the country. As Mr. Pond put it, "Stop to think of the ultimate result—a nation of wood users could be developed in ten years if the millions of boys and girls could use a hammer and saw with reasonable dexterity. The time to instill this instinct into the child is between the ages of six and twelve, not after entering the high school."

The tendency of educational opinion is definitely in the direction of making school work more practicable, and this tendency undoubtedly favors a movement such as that suggested by Mr. Pond. Educators have found that the public is correctly demanding training that has a direct relationship to life, and cannot be defended merely on the ground that it is mental gymnastics. The old division between the "academic" and the "manual students" is being wiped out, for every where the effort is being made to give every student a chance to work with his hands and to become practically, instead of merely theoretically, efficient.

The way conditions are changing is indicated by the situation in a middle western city of 250,000. Ten years ago the only work of a manual training nature was given in a high school devoted exclusively to that subject; or, more exactly, it was the only institution where manual training was taught. A little later on the high school where academic subjects only were taught developed a demand for practical work, and a manual training course, involving woodwork, was instituted there. It has since been extended and enlarged. In fact, the two schools, which formerly were as far apart in their ideas and ideals as the poles, have now become so nearly alike that a new building now in course of construction is to house a consolidated school. Everybody, in other words, wants manual training.

Nor is this all. The same city now has a "prevocational" school where boys and girls who cannot attend the high schools spend the last two years of their school courses in learning practical things, such as woodworking, printing, etc. The prevocational idea has been in evidence for only a short time, but the great demand for the extension of the course has already resulted in an agreement to undertake the work next year on a much larger scale. There are plans being made for "continuation schools," where boys and girls who are forced to go to work before completing their education may return one or two afternoons a week for the purpose of acquiring practical training that will make them more efficient in their daily employment. Manual training and domestic science, also, are being introduced into the ward schools, the seventh and eight grade pupils, as well as the high school students, now having an opportunity to acquire some of this practical equipment which has been denied to them for so long.

And this is just one typical American city whose experience shows that educational forces all over the country are working in favor of training of a kind which means more working in wood and more consumption of wood. The suggestion that lumbermen should co-operate in every possible way to increase the number and scope of manual training courses is certainly in line with the logic of the situation.

While most of the training being offered through the medium of the public schools is not intended to be vocational, in the sense that it is to fit the student for earning a living in that kind of work, it has a direct connection with trade instruction, and in many cases takes the place of the apprenticeship which formerly was necessary. In many cities manual training schools have developed into trade schools where the practical ideas have been emphasized and pointed in the direction of wage-earning, so that in addition to giving the students the working knowledge which is valuable to anyone in any walk of life, the schools are contributing a big quota of trained mechanics to the never too crowded ranks of artisans of all kinds, and especially workers in wood.

That manual training may profitably be extended to the lower

grades is indicated by the excellent results which have been secured where the younger boys are shown how to use tools and given practical work to do. A recent issue of the Manual Training Magazine contained a description of the work of fifth grade boys, eleven or twelve years old, in the Newman Manual Training School at New Orleans, showing the work of these boys in building greenhouses and other structures requiring considerable practical knowledge.

The big idea in connection with manual training, from the standpoint of the lumber trade, is getting the youth of the country interested in wood, familiar with it, and fond of seeing its various applications. In other words, encouraging sentiment in favor of wood is a consideration of prime importance. But while this is probably the chief benefit that is to be gained, by making this "a nation of wood-users," the actual consumption of wood in the work of the schools is not to be disregarded. The business is handled chiefly through retailers, and is too small and contains too many details to appeal to the wholesale hardwood dealer; but it is worth noting that the sum total of wood used is far from insignificant.

The Louisville, Ky., board of education, which is now taking bids on supplies for the next school year, found it necessary to devote three pages of its list to the lumber items, which included some surprisingly large figures. There were five items of yellow poplar, amounting in all to 26,500 feet; a lot of short dimension stuff, including 2,122 pieces of yellow pine, 150 packages of basswood, 500 packages of cottonwood or lynn, and a large variety of other stuff which was not identified except by samples. Red gum was also included in the list of dimension stock wanted. Several thousand feet of quartered oak, plain oak, mahogany shorts, maple, walnut, chestnut, etc., were called for, and the sum total, while not attractive as a sales proposition, was impressive in showing the amount of wood actually being used in the manual training work of the schools.

One of the interesting features of the lumber business at present is the effort being made to call the attention of consumers to the qualities of various woods, and to point out their special adaptability to the several uses for which they are particularly suited. It seems strange, from one standpoint, that this should be necessary, and that Americans should have gotten so far from the land that they are in almost total ignorance of the characteristics of the woods which were worked in by almost every householder a few generations ago. But this is the case, and the necessity of such information is self-evident. If the instruction in manual training were as general as it promises to become, such efforts would not only be met with a greater degree of responsiveness, but would bring far greater results, because they would be considered by consumers who were in a position to appreciate the arguments made in favor of this or that wood.

Walnut manufacturers are just now calling attention of manufacturers, architects and the public, in a limited way, to the desirable features of this wood. But it is fair to assume that the boys who work in walnut in the manual training schools will be able to learn a great deal about the good qualities of this wood without being told; and the same is true of every other wood which is used in the shops of the manual training schools.

HARDWOOD RECORD reported some time ago the fact that a leading mahogany concern is making a special concession to manual training institutions for the purpose of getting those schools to increase their use and consumption of mahogany. This was not because the company regarded the business as desirable in the sense that it would make a profit on each sale; on the other hand, the chances are that considered in this way the trade involved a loss. But those who are managing the affairs of this company realized that if they could get the boys used to handling mahogany, they would make mahogany "fans" and boosters by the thousands; and that their appreciation of its beauty and workability and finish would result in their deciding to own as much mahogany furniture, then and later, as they could.

The possibilities of manual training and practical instruction in woodworking have only begun to be realized and developed; and if,

as Mr. Pond suggests, the lumber and allied interests should take hold of the proposition, and offer it the assistance calculated to stimulate its development, their profit would be enormous, and the

permanent consumption of wood would be greatly increased. There is hardly any other way in which effective opposition to the use of substitutes could be more easily presented.

Aggressive and Cowardly Trees

Forest trees and human beings possess certain traits in common. Some are aggressive, while others cannot stand competition. It has always been a feature of history that certain tribes of men have retreated to deserts or to bleak and inhospitable climates rather than fight for and hold the good countries. The same rule holds with forest trees. Some withdraw to tracts where competitors cannot follow.

The great and stately white pine is a vegetable coward; but that term must be used in a pretty wide sense to be wholly applicable. This tree was found in the original forests of America occupying sandy tracts, rocky hills, and uninviting situations. In its long struggle with competitors, it lost the rich valleys and fertile hills, and retreated to situations where pursuit and competition would be less vigorous. It found retreat easier than fighting.

Some people suppose that the white pine occupies sand, swamp, and rocks because it likes those conditions best. The correctness of that opinion is doubtful. Probably no tree "likes" poor soil, though some are seldom found elsewhere. It is true that some have lived so long in such situations that they have partly accommodated themselves to their environments, in seed bearing and in other ways; but it is doubtful if it should be stated as a general proposition that any trees seek poor places from choice. Back of their presence there, it may be taken for granted that there is compulsion somewhere.

SEEKING THE SWAMPS

Cypress is a vigorous tree, of gigantic bulk and long life; but it fled to the southern swamps while the white pine was taking refuge on sandy tracts and rocky ridges in the North; and it fled from the same enemy—other trees which demanded the best lands.

The southern white cedar, which grows from New Jersey to Florida along the coast, has likewise taken refuge in swamps, and tupelo gum has done likewise, and so has water elm, though it is not of much importance anywhere.

The mangrove tree is one of the best known instances of trees which literally "got off the earth." It grows in the water-along the shores of southern Florida, and has done it for a period so long that its seeds have lost any land habits they ever had, and are now adapted to water planting only.

THE SOUTHERN PINES

The southern pines resist competition feebly. The longleaf pine, which sticks to the sandy land more closely than some of the others, is a poor fighter for space. It is the opinion of some good botanists that if left to its own resources, with no human help, it could not hold its present ground many hundred years. Grass would choke the seedlings, and broadleaf trees would finally take possession. It is believed that before the white man's coming, it was the Indian's yearly fire that enabled the longleaf pine to hold its ground. The fires burned the grass and the broadleaf seedlings, but the pines managed to survive the scorings sufficiently to perpetuate themselves, though the stands were usually quite thin.

There is agreement among old writers that loblolly or old field pine in Virginia and North Carolina was scarce at the time of the first settlements. It was chiefly found near the coast and the mouths of the tidal rivers, to which localities it had apparently been crowded by the hardwoods. After the hardwood forests had been cleared to make plantations, and the plantations had been worn out by cultivation and abandoned, the loblolly pine found competition removed and then spread inland, and is today more plentiful than it was three hundred years ago. It could not spread until man cleared the way for it.

RIDGE TIMBER

The pitch pine of the eastern states, which has various names in different regions from Massachusetts to Tennessee, can hold no fertile ground. Other trees crowd it out. It retreats to poor tracts where its most vigorous pursuers will not follow. It will grow where even white pine cannot hold out against adversity. It takes possession of sterile ridges, where the soil is dry and thin. Forest fires do not often hurt it, and it is safe in its poverty.

A still more noted instance of a cowardly tree, if there ever were one, is the scrub pine, also called Jersey pine, a small, puny tree, of poor form and pitiful appearance, a very Lazarus of the forest, willing to subsist on the "crumbs" that fall from other's tables. It grows in New Jersey, Maryland, Virginia, West Virginia, and further south and west. It creeps into open spaces, and is the companion of sa-safras and huckleberry bushes. Old worn-out, gullied fields appeal to this pine, because little else will grow there, and it is not obliged to fight for room.

In course of time, however, as the impoverished soil begins to recover, broadleaf seedlings come in. As these increase in size, the scrub pines die, and finally disappear. Though they have been in full possession of the ground, they are unable to hold it against competitors.

BROADLEAF TREES

As a rule, the broadleaf trees are better fighters for ground than the soft woods. The trees which bear broad leaves—that is, the hardwoods—have been the principal means of driving the pines, cedars, and cypresses to sand, rocks, and swamps. The hardwoods are handicapped, however, by their inability to prosper on poor soil. They can crowd their competitors off the fertile land, but cannot follow with much vigor upon sterile soil.

The oaks may be classed as the strongest of all trees; that is, they can hold their own in more kinds of soil than most others. But there is great difference in this respect among the fifty-odd kinds of oak in this country. The willow oak and the water oak, for example, can follow the cypress to the very edge of the swamp in which it takes refuge from their pursuit; but they cannot follow the white pine, pitch pine, and table mountain pine very high on the hills. The chestnut oak, on the other hand, can grow on ridges about as barren as those where the pitch pine makes its last stand. Like the pitch pine, the chestnut oak is about as nearly proof against forest fires as any tree.

Other oaks are able to maintain themselves on very poor land. The bur oak is one of them. It is usually the last broadleaf tree to disappear from hardwood tracts, within its range, that are repeatedly and severely burned.

AGE AND ADVERSITY

It is believed that the first trees on earth were the softwoods or the needle-leaf species. They had full possession once, if that theory is true. When the broad-leaf trees appeared, in the course of ages, they had to fight for every acre they got. Up to the present time they have succeeded in taking most of the fertile land, but the ancient species, the softwoods, are yet able to hold the poor places.

Pines, spruces, cypresses, and other softwoods flourish on fertile land when given a chance. This is shown by the vigor of planted and protected trees, in parks and in woodlots. It appears evident that the softwoods did not betake themselves to sand, rocks, and swamps because they liked those places better, but because they were driven there by competition which they could not successfully meet.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 830—Wants Rock Elm

Brooklyn, N. Y., November 24. Editor HARDWOOD RECORD: We are in the market for 40,000 to 50,000 feet rock elm 1 1/2" thick, rough, to inspect No. 1 common or will consider No. 2 common and better. Will pay spot cash for same and desire a price f. o. b. Philadelphia, Pa.

If you have anybody on your list that you think would be interested, kindly advise.

Anyone interested will be furnished with the address of this prospective customer, upon application.—EDITOR.

B 831—Seeks Red or White Oak

Lincoln, Neb., November 25.—Editor HARDWOOD RECORD: We are in the market for 5 cars of 2 x 4, 2 x 6, 2 x 8, 4 x 4 and 4 x 6, all 10 to 16 feet long clear plain red or white oak, or mixed, for shipment beginning February 1, 1915, and running to July 1.

Any information you can give us as to a source of supply will be appreciated.

Those interested in this inquiry will be supplied the address of our correspondent upon request.—EDITOR.

B 832—In the Market for Dogwood

Philadelphia, Pa., November 27.—Editor HARDWOOD RECORD: We have an inquiry for 3 or 4 cars dogwood, winter cut, 4' lengths, 4" diameter on small end, and larger.

If you are in touch with any parties on the eastern coast who could fill this order, we would esteem it a favor if you will mail us their names.

Anyone having this stock to offer will be gladly furnished the address of this eastern house, upon applying to HARDWOOD RECORD.—EDITOR.

B 833—Data on Cost of Veneer Manufacture

Editor HARDWOOD RECORD: Can you give us any information in regard to the cost of making three ply veneers 3/8" thick to 5/8" thick—made from logs that cost \$5.00 per M. at the mill? We want the cost of cutting the veneers on a rotary machine and gluing three pieces together to make three-ply veneers.

The above inquiry was published in the November 25 issue HARDWOOD RECORD, and has been replied to by a reputable Michigan concern as follows:

Ludington, Mich., November 28. Editor HARDWOOD RECORD: The cost of labor and glueing per thousand square feet for three-ply veneer such as we make is \$10. The cost of glueing is more or less variable, but we are giving the figures for high-class work. We use only first-class glue and a good spread in order to insure satisfactory work.

One thousand feet of No. 1 logs will give veneer as follows: 1/15", 10,000 square feet; 1/20", 13,000 square feet. The cost of sanding veneer 3/8 to 5/8 inches thick will average about \$1.25 per thousand square feet.

The cost of cutting is as follows: 1 1/5", 45 cents per thousand square feet; 1/20", 37 cents per thousand square feet. Sanding will bring these dimensions down to those mentioned by your correspondent.

From these figures we trust your correspondent will be able to figure his cost per thousand feet. We have given these figures on the very highest quality of veneer, such as we use for our game boards and folding tables.

B 834—English House Seeks Elm and Tupelo

From the north of England comes the following letter:

November 20.—Editor HARDWOOD RECORD: We require a low quotation for soft American elm suitable for coffin purposes, inch thick x 12" and wider with say 30 per cent to be 16" and wider, lengths all 13' and 16' if possible, but would accept a small percentage of 12', if desired. The quality would have to be prime.

Also require prime tupelo 1" x 20" to 22" wide, usual lengths.

Quotations on this stock sent to this office, will be forwarded to this foreign prospective purchaser.—EDITOR.

B 835—In the Market for Gunstocks

Hartford, Conn., December 1.—Editor HARDWOOD RECORD: Can you give us any information as to where we can buy from 100 to 200 pieces of wood for gunstocks? We would like to buy the same kind wood as is used by the United States government in making the regular service rifle.

This concern has been referred to sources of supply for this stock.

Others interested will be placed in communication with our correspondent, upon request.—EDITOR.

B 836—Location for Saw and Veneer Mills

Calvary, Wis., November 29.—Editor HARDWOOD RECORD: About forty farmers of the town of Brannon, Price county, Wis., have organized a land association for the benefit of developing that section of the country. This is a very fine country without saw and veneer mills, or any kind of a plant to manufacture their forest products in their own community.

We would like to get some sawmill and veneer mill started, thinking probably you could put us in touch with some person or company that is looking for a good location.

We have just secured a new railroad which will haul all the forest products for us. We have timber for years, mostly hardwood, birch, etc. We will give free land and logs for lumber for the plant. The farmers agree to put in not less than 1,000,000 feet each year.

Any person or company interested may write to our secretary, as noted below. We are willing to correspond with, or meet any person at any time to talk the matter over and try to make a deal.

We are incorporated with non-stock; no dividend; no profit.

GEORGE F. MEYER, Calvary, Wis.

Clubs and Associations

The Last Stag of the Chicago Club

On Saturday night, December 12, the Lumbermen's Club of Chicago will hold its last stag of the year, and it is planned to make this a memorable event.

As usual the club rooms are open to members and friends, and also as usual the entertainment committee has prepared a number of pleasant surprises which will be sprung.

It is hoped that a good number of members will come out and bring their friends along to celebrate the last regular function of the year.

Plans for Forestry Association's Annual

In order to aid in outlining details of the important work which it is to do next year, the American Forestry Association has invited leading foresters throughout the country to attend its annual meeting in New York City on Monday, January 11, at the assembly room of the Merchants' Association of New York in the Woolworth building. The meeting is for the purpose of discussing the best service the association can render to various phases of forestry, lumbering and the paper and pulp trade.

Chief Forester Henry S. Graves will speak of what the association can do to aid the Forest Service, various state foresters will speak of what can be done in state forestry, and other experts will discuss other forestry problems.

J. E. Rhodes of Chicago, secretary of the National Lumber Manufacturers' Association, has been invited to address the meeting on what the association can do to aid the lumbermen, and E. A. Sterling of Philadelphia, the well-known forest and timber engineer, will speak on the relation of the public to a sound economic basis in the lumber industry. E. T. Allen, forester of the Western Forestry and Conservation Association of Portland, Ore., and western representative of the American Forestry Association, will speak on what the association can do on the Pacific slope, with special reference to the big public meeting which the association plans to hold at the Panama-Pacific exposition next July.

Exporters' Annual at Memphis in January

The annual meeting of the National Lumber Exporters' Association has been arranged to take place January 21 and 22, 1915, at Memphis, Tenn. The Gayoso Hotel has been selected as headquarters, though the program of the business sessions has not yet been made up. It is thought, however, that the conditions created by the war will receive much attention and may take up most of the time of the sessions. The report of the foreign representative, Frank Tiffany, stationed at London, will receive careful consideration, dealing as it does largely with the settlement of war claims and with what has been done to expedite such settlement. It will be shown that Mr. Tiffany has been exceptionally successful in advancing such claims and that the results attained by him have proved highly successful.

Who will be elected president is uncertain. Fred Arn of the J. M. Card Lumber Company of Chattanooga, Tenn., is completing his second term, and it is thought can have another if he wants it, though the death of his partner may have so increased the pressure upon his time as to induce him to decline on that account. It is considered certain that the arrangement with Mr. Tiffany will be continued and that J. McD. Price will be re-elected secretary. An exceptionally large attendance is expected because of the important questions to come up.

Philadelphia Wholesalers Enjoy Annual Dinner

The second annual get-together dinner given by the Philadelphia Wholesale Lumber Dealers' Association to the members and salesmen was held at the St. James hotel, November 20. Eighty-five diners were present on the occasion, and President Ralph Souder acted as toastmaster.

The principal speaker of the evening was Arthur F. Sheldon, founder of the Sheldon School of Salesmanship, Chicago, whose talk on the subject of efficient salesmanship was much appreciated by all his hearers.

Robert G. Kay, president Kay Lumber Company, gave an encouraging talk to the boys on the business outlook. He prophesied with profound sincerity that prosperity would be a material certainty in the United States in about thirty days (note accuracy), and that those disconsolates who are now placing small orders for immediate shipment would be then ordering in four and five carload lots.

Sawdust Club to Dispense With Annual Dinner

The Sawdust Club of Philadelphia, a select organization composed of lumbermen who are members of the Union League, on account of the recent death of Frank C. Gillingham, its first and only president, have decided to omit their annual dinner this year. At their annual business meeting, which will take place in January, 1915, a president to succeed Mr. Gillingham will be elected.

Philadelphia's Exchange in Monthly Meeting

The Philadelphia Lumbermen's Exchange held its regular monthly meeting on December 3, with President William H. Fritz in the chair. After the reading of the minutes of previous meeting only routine business was transacted. President Fritz then proposed, as the exchange felt itself so much benefited by the talk of Dudley Bartlett, chief of the foreign trade bureau of the Philadelphia Commercial Museum, at the last meeting, that the members of the exchange at this meeting give their respective views on how the Lumbermen's Exchange of Philadelphia can best serve the interests of lumbermen in Philadelphia and vicinity. William C. MacBride, John S. Lloyd, Horace A. Reeves, Jr., Thomas B. Hammer, Robert C. Lippincott and Augustus J. Cadwallader expressed themselves concisely and to the point on the subject.

It was announced that the usual year end get-together entertainment would be held as usual on December 31.

Lumbermen at Golf

Thirty-two members of the Philadelphia Lumbermen's Golf Club braved a bleak wintery day on December 4 to play their favorite game of golf on the links of the Seaview Golf Club, Absecon, N. J. So goodly an aggregation of experienced sports on these grounds was an honor which the club much appreciated, as the Seaview Golf Club is a specially endowed one-man affair. It is owned by C. H. Geist, a wealthy lover of this fascinating outdoor exercise. The course is ingeniously laid out with all the little nerve-tickling and patience-trying devices, and for a new and untried ground the greens were pronounced in splendid condition. The occasion was made doubly interesting by the contest for two special prizes, which were won as follows: Low net ball, Horace A. Reeves, Jr., score 78, who received an order on the Spalding Sporting House for five dollars' worth of appropriate goods. The best ball of partners' prize fell to Edward B. Humphreys and James B. McFarland, Jr., who each received an order on the same firm for three dollars and a half worth of goods.

A select luncheon wound up a much enjoyed game, and after a rousing vote of thanks extended to Mr. Geist and the Seaview Golf Club the party left on the 4:45 p. m. bridge train for Philadelphia.

Doings of the Memphis Lumbermen's Club

E. E. Taenzer, a former president of the Lumbermen's Club of Memphis, who has gone to California to engage in business, was elected an honorary member of this organization at the regular meeting held at the Hotel Gayoso, Saturday, Nov. 28. His resignation was tendered some days ago and was received with a great deal of regret. Mr. Taenzer was for years one of the most loyal workers in the club, and the members were delighted at being able to confer this distinction upon him. In tendering his resignation Mr. Taenzer declared that there was nothing to regret about his decision to remove to California so much as the fact that it would cut him off from further active association with the members of the Lumbermen's Club of Memphis, with whom he has been thrown for years in very close social and business intercourse.

D. R. Trippett, southern purchasing agent for Taylor & Crate, Buffalo, with headquarters at Memphis, was elected an active member.

The election of officers for the ensuing year will be held December 19. The very close approach of this event brought forth statements from President Allen that he would appoint two nominating committees this week and that they would select their candidates and make their names known at the regular meeting to be held Saturday, December 12. Only one week is allowed for campaigning, but the members anticipate that this will be a very warm election, although nothing is known regarding the identity of any of those who will make the races.

The club went unanimously on record as favoring the abolition of the fee system in this (Shelby) county. It appointed John W. McClure as the representative of the club on the committees which are being appointed at the suggestion of the City Club. It is the idea of members of the Lumbermen's Club of Memphis that the substitution of fixed salaries for county officers and the payment of the fees into the county instead of to these men will result in substantial reduction in the tax rate.

F. E. Stonebraker, chairman of the special committee which was appointed to determine the best channel through which to forward the relief fund of \$500 appropriated by the club for the relief of the Belgians at a recent meeting, said that the money had been turned over to the Memphis *Commercial Appeal*. This paper has forwarded it to the Belgian minister at Washington and the latter has sent it to the American com-

mission at New York, which is engaged in purchasing food, clothing and other necessities for the relief of the suffering in that country. Mr. Stonebraker and the members of his committee were thanked for the efficient manner in which they had handled this matter.

Hal. E. Yocady was present. He is connected with one of the departments of the New Orleans Association of Commerce and is spending much time in working up closer business relations between people of New Orleans and those of Latin America. He said that some very important steps had already been taken and that various departments had been established, covering trade opportunities, credits and other features. He thought the trade with Latin America belonged very largely to the people of the Mississippi valley states, and said that the opening of the Panama canal had provided an excellent opportunity. He did not think that anything was necessary beyond active co-operation on the part of business men of the Mississippi valley states, and he urged this. He said that New Orleans had a system of refunding transportation where people from Latin America made purchases up to a certain amount, and he recommended that Memphis adopt a similar plan under the auspices of the Business Men's Club. Members of the club listened with a great deal of interest to what Mr. Yocady had to say for the reason that they participated in the recent conference here looking to increased business with South and Central America, and because they are very anxious to take part in any movement which holds out promise of giving them new outlets for their products at a time when the European market is almost closed.

Pittsburgh Lumbermen's Club Holds Annual Meeting

The Pittsburgh Lumbermen's Club held its second annual banquet and entertainment in the German Club house on the evening of December 3. The event was by far the most successful ever pulled off by any lumbermen's organization in this city, and President Charles E. Breitwieser, as well as his fellow officers and the entertainment committee was warmly congratulated. Invitations to the event were printed on mahogany veneer and mailed to every retail lumberman in Allegheny county two weeks in advance. The program and menu were also printed on mahogany. More than 150 lumbermen with their wives and daughters were present. A separate "Him" book was also a very attractive feature of the printer's art. A great variety of articles, including natty jewelry and toilet and household articles, were presented to the guests during the grand march. Every lumberman was disguised for that occasion with the most grotesque headgear, aprons, etc., while the lady guests dashed upon the ballroom floor clad in fierce looking habiliments of a "suffraget army." The grand march and the other ballroom stunts were in charge of Mrs. Bruckman, wife of the president of the Bruckman Lumber Company.

The banquet was a howling success. A splendid orchestra, fine soloists and side-splitting monologues, together with moving picture exhibits, would have made a fine two-hour program in themselves. The tables were beautifully decorated with smilax, and each lady was presented with an American Beauty rose.

The event of the evening was the masterful address of Carl W. Winderknecht, "the redwood king of San Bernardino, Cal." The big majority of his hearers were not only immensely delighted but also greatly amazed after the dinner to learn that he was a celebrated comedian from Pittsburgh, made up for the occasion. The address of welcome of President Breitwieser was an earnest plea for more co-operation in business and social life among the Allegheny county lumbermen.

Monthly Meeting Cincinnati Lumbermen's Club

The regular monthly meeting of the Lumbermen's Club of Cincinnati was held December 7. As a little diversion from the usual program on such occasions, the entertainment committee made its arrangements and held the meeting at the famous German Village, which is provided for just such parties by the Geo. Wiedemann Brewing Company just across the river at Newport, Ky. The novelty of a beefsteak and pitch potato dinner will long be remembered by those making their first trip. The dinner was a huge success and music was rendered during the evening by a colored quartet who had specially arranged parodies for the occasion and sang them to advantage, touching up many of the prominent members with their references to the particular hobbies of each. After a couple of hours of feasting and merrymaking, President Schmidt called the meeting to order. One of the first things taken up was the question of securing the next convention of the National Hardwood Lumber Association next summer and President Schmidt was urged to do everything possible to secure for Cincinnati this convention.

Chairman Eckman of the river and rail committee reported that much had been done toward preventing the proposed increase in lumber rates and at his suggestion a committee, composed of Messrs. Thoman, Dulweber and Morris, was named to represent the club at hearings on the rate question to be held at Louisville and Memphis shortly. Heretofore the club has been composed of wholesalers and manufacturers only, but at this meeting the bars were let down and all retail dealers in Cincinnati, Covington and Newport will be invited to join the club.

Announcement was made of the death of the wife of W. H. Schleyer of the Kosse, Shoe & Schleyer Company. Mrs. Schleyer had been ill for a long time, and much sympathy for Mr. Schleyer was expressed. A suitable floral offering was ordered sent.

The meeting was well attended and the attitude of the club in taking a very active part in the freight rate fight that is on has the support of a large majority of the membership.

With the Chicago Association

Following closely the announcement of the amalgamation of the Lumbermen's Club of Chicago and the Lumbermen's Association of Chicago, which will take place upon the occasion of the latter association changing its headquarters to the new Lumber Exchange building, the membership committee headed by Charles Westcott of the Hayden & Westcott Lumber Company, is making strong efforts to increase the membership of that already powerful organization. Mr. Westcott has gotten out a very striking letter which will surely bear desired results.

It is planned now the Chicago Lumbermen's Association will be located in the new Lumber Exchange building on May 1, 1915. The association will occupy practically the entire fourth floor. The building is situated at the corner of Madison and La Salle streets, the most central location in the business district, directly across from the La Salle hotel.

The association is enlarging its activities in keeping with its more pretentious quarters. Lunch will be served to members in the association's dining room. Unquestionably this will be the general meeting place of local lumbermen from all parts of the city.

According to present arrangements, those firms having no established headquarters in Chicago, are eligible to non-resident membership at an annual cost of \$25, and any representative of such member or firm will be entitled to all the advantages of the association rooms.

The inspection department presided over by Chief-Inspector H. N. Hanbury has always been an important part of the association work and has become quite famous not only in Chicago but elsewhere.

Hardwood Association Has Annual Meeting and Banquet

All the old officers of the Northwestern Hardwood Lumbermen's Association were re-elected at the annual meeting held recently at the West hotel, Minneapolis, Minn. It was attended by more than thirty hardwood dealers of the twin cities and Wisconsin, and following the business meeting about fifty sat down to the annual banquet and later attended the Orpheum theater. President A. S. Bliss presided at the meeting. All officers were re-elected as follows: President, A. S. Bliss; vice-president, T. T. Jones; secretary, J. P. Hayden; treasurer, F. H. Lewis.

North Carolina Forestry Association

The fifth annual meeting of the North Carolina Forestry Association will be held on Wednesday, January 13, 1915, at Raleigh, N. C. The people of that state are taking hold of their forest problems in a way that promises better things in the future than in the past. The State Geological Survey is doing much forestry work under the direct supervision of J. S. Holmes, formerly of the United States Forest Service.

Definite Move To Establish National Trademark

Recognizing the opportunity for American industries firmly to establish American-made goods in all the foreign markets and to compete the fash of imported goods which has so long held sway in the United States itself, and desiring to focus the movement which is already well under way to label all American-made goods as "Made in the U. S. A.," the Detroit Board of Commerce has offered a prize of \$500 for the best "Made in the U. S. A." trademark. Because many cities such as Grand Rapids, Mich., which is famous for its furniture; Troy, N. Y., which is famous for its collars, and other cities similarly noted for certain products may desire to use the name of the city in connection with such a trademark, the prize of \$500 is offered for a "Made in Detroit, U. S. A." trademark.

The rules of the contest state specifically, however, that the trademark must be national in its character, but that space must be provided for the name of any city. There will be nothing local about the accepted trademark. It must, however, be so spaced as to provide for the use of city names when a manufacturer or an industry so desires. Full information on the contest and rules are being sent to leading artists and designers all over the United States through the newspapers, national magazines, trade journals, art publications, etc. The contest is being brought before all who may care to submit trademark designs.

At the completion of the contest, the Detroit Board of Commerce will offer the design chosen to the manufacturers of the United States, other boards of commerce, the National Association of Manufacturers, the United States Chamber of Commerce and similar organizations. The Detroit Board of Commerce will present this trademark for gratuitous use in the hope that its general adoption may result in the labeling of all American-made goods with a standard trademark so that America and all the people of the world who buy in American markets may recognize the goods they use as made in the United States of America.

"We see in this contest a means in gaining a widespread support to the movement of American goods for American people," said Charles B. Warren, president of the Detroit Board of Commerce. "Our purpose is not simply to label American-made goods and to show the people of the world and our own people that American manufacturers are proud of the goods they make. At this time when the war in Europe has cut down our imports of foreign goods and when our own manufacturers are distributing American-made goods to all parts of the world in larger quantities than ever before, American industries have the greatest opportunity to build up an industrial prestige for the United States. It has seemed to the Detroit Board of Commerce that this prestige can best be gained through the universal use on American-made goods of the 'Made in U. S. A.' trademark.

"We have felt that the movements in this direction which have already been started lack organization. Nothing really definite has been done,

True, some 'Made in U. S. A.' organizations have been started. Some individuals and a number of publications have given impetus to the movement. But we can never secure the proper marking of American-made goods without a trademark and the Detroit Board of Commerce is to initiate the movement in this direction.

"One of the greatest things we hope to accomplish by trademarking American-made goods is to convince American buyers that the goods we build in the United States are equal in quality to those which we have been importing in the past. I do not think there is an American manufacturer who will admit that he cannot build all of the necessities and most of the luxuries of life quite as well as the best European manufacturers. There has always been in the United States something of a mania for imported goods.

"I do not believe that the mere labeling of our products or that patriotic fervor will ever sell goods which are shoddy. Quality must always count in the long run. But if we do build quality products there is no reason why they should not sell alongside imported goods. The mere fact that an article is imported is not necessarily an indication of superiority in the product.

"It is an actual fact that the United States manufactures many things in every way superior to the same product made abroad. But in the United States we have been buying goods simply because they were imported. We have been hypnotized by the idea that a thing made in Europe is better than the same thing made in the United States. The European war has forced us to an awakening. The opportunity is before us. We have only to take advantage of it by capitalizing the fact that the goods we use are made in the United States of America."

This is the big thing that the Detroit Board of Commerce hopes to accomplish by giving the people of the United States a "Made in U. S. A." trademark. The vast possibilities of such a national trademark for American-made goods are at once apparent. In offering a "Made in U. S. A." trademark to the American people, the Detroit Board of Commerce hopes to see the adoption of this trademark for all kinds of goods, and in all American advertising.

The trademark which will be selected will not be copyrighted and will have no royalties attached to it. It is free to the American people. A gift from a patriotic civic organization in Detroit to everyone who is interested in promoting America's prosperity.

Cypress Manufacturers Meet

The regular semi-annual meeting of the Southern Cypress Manufacturers' Association was held at Hotel Gramewald, New Orleans, on December 2. Inquiries, looking toward an increase in business, are now much more active than at any previous time since the beginning of the European war. The meeting voted to increase the fund for advertising purposes. It has been found that advertising has resulted in an increase in business. It is now proposed to increase the advertising in farm papers, particularly in the states which have had large crops of grain. It is believed that many farmers will buy lumber this year for improvements on their farms.

With the Trade

Stearns Salt & Lumber Company Increases Payroll

The payroll of the Stearns Salt and Lumber Company at Ludington, Mich., for the first ten months of 1914 does not indicate that general adverse business conditions have struck hard there. The payroll totaled \$427,254.96, and that was an increase of \$70,000 over the first ten months last year. In a case like this may be seen the good results of talking business instead of grumbling about hard times.

The reason for this remarkable increase during adverse business conditions throughout the country was in part the determined effort of the Stearns people to keep the wheels turning, and partly a development in new business which came by reason of the well-known high quality of the Stearns' product. That this is a remarkably fine showing considering prevailing conditions affecting lumbermen will surely be conceded.

Eastern Concern Has Difficulty in Getting Logs

The Astoria Veneer Mills & Dock Company of Long Island City, N. Y., which specializes in sawing high-grade veneer logs on a custom basis, is finding its business very considerably restricted on account of war conditions which have prevented the importation of sufficient quantities of logs to keep veneer mills active. Of all of the veneers used it is reported that mahogany forms a very considerable per cent of the demand.

This wood is brought from Africa and other points via Liverpool, and shipments to this country have been very meager since the opening of the war. In fact, up to the end of November there was but one small shipment received at New York during the preceding two months.

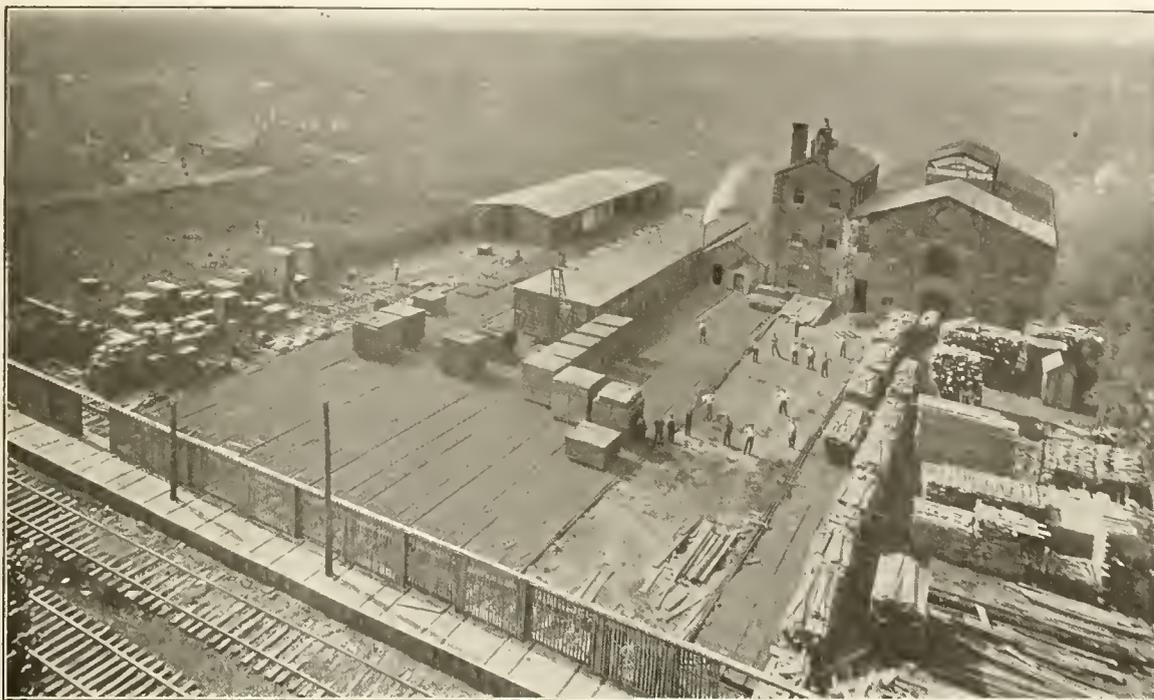

The difficulty lies in the unwillingness of the ship owners to risk losing their possessions to hostile navies, and hence shipment from the mahogany producing section is very limited.

As a matter of fact, the demand is very good and prices seem to be looking up somewhat in this particular wood. Unfortunately the Mexican wood is also shipped irregularly on account of unsettled conditions in that unfortunate country.

A Specializing Flooring Plant

A highly efficient plant for manufacturing oak parquet flooring has been equipped at Lexington, Ky., by the Federal Parquet Manufacturing Company, and sales offices have been opened in the Flatiron building, New York. This plant has been laid out along scientific lines and with the sole purpose in view of turning out the very highest grade of product and upon a cost basis which is very favorable to the increased use and

meeting the greatest needs of the flooring trade: First, because it is a highly desirable floor; and, secondly, it permits the architect to lay a long and wide floor to scale with large rooms and proportionately smaller flooring to scale with smaller rooms, at the same time assuring, in both instances, uniformity of color not possible in strip flooring. The large quantities produced enable it to meet the wants of the trade in all particulars.

BIRD'S-EYE VIEW OF THE PLANT AND YARDS OF THE FEDERAL PARQUETRY MANUFACTURING COMPANY, LEXINGTON, KY.

prestige of parquet flooring. It is in no sense a side line proposition, but essentially a parquet flooring plant. In addition to the advantages which will accrue from the special construction and equipment of this plant, its location at Lexington, Ky., provides shipping facilities of the very best via all lines to eastern and western points on advantageous freight rates. The company will enter to the carload trade, but for the purpose of supplying smaller demands and for the convenience of the trade at local places, it will carry a well assorted stock in warehouses in New York City, and in other places as soon as satisfactory arrangements can be made.

The accompanying illustrations will give not only a fair appreciation of the plant facilities of this company, but likewise the substantial supplies of oak lumber used in manufacture.

Fifty-two kinds of oak grow in the United States, and most of them are regularly made into flooring. This company has separated the oaks as far as possible to insure uniform quality, and with the large supplies from which it draws, the uniformity of texture and color assured will be an important point in quality of its flooring, being produced entirely from one boundary of timber, ninety per cent of which is white oak. In specializing largely on bearing bone strips, the company believes that it is

accompanying pictures. The trucks are then run into the dry kiln, where the lumber is thoroughly kiln-dried, and, without being touched, is moved out into the flooring plant, which is completely tracked on two floors. Here the lumber is made into flooring, and when finished is returned to the trucks and run out of the mill and finally loaded direct into the cars. Thus the lumber from the sawmill of the company at Quicksand, Ky.,

Its plant is equipped with the latest and best machinery; and the tongues and grooves and end matching are mathematically perfect. The company has perfected a design of parquet to lay over cement floors. The end matching machines are hopper fed and match both ends of the piece at one time, giving absolutely accurate work, which is of the utmost importance in this class of manufacture. The dry kiln department has been built under the latest plans and system with steam and hot air process. The kilns are built of reinforced concrete and hollow brick.

The company has studied the greatest efficiency in laying out its premises to handle and manufacture the raw product. All trucks are of one gauge. As lumber is received from the sawmill it is piled on trucks and allowed to dry there, as shown in

ANOTHER VIEW OF MILL SHOWING TRACK ARRANGEMENT IN RELATION TO MILL AND DRY KILN DEPARTMENTS; GENERAL TRACK SYSTEM SHOWING METHOD OF HANDLING STOCK ON TRUCKS FROM THE SAW MILL THROUGH ALL DEPARTMENTS AND INTO CARS WHEN FINISHED

travels all the way through the drying and manufacturing process into the cars on these conveying trucks, so that the stock used in the manufacture of this flooring never touches the ground from the time it leaves the saw until the finished product is put into the cars for shipment to destination.

All the departments of the plant are kept at even temperature, which is another necessary feature in the manufacture of high class flooring, while the finished stock, where not immediately shipped out on orders, is kept in a steam heated store-house.

In order to completely serve the trade with strip flooring, as well as with its own parquetry product, the Federal Parquetry Manufacturing Company has secured from the Mowbray & Robinson Company of Cincinnati, Ohio, the exclusive sale of the strip flooring to be made by that house at its plant. This strip flooring will be made from the same quality of oak as the products of the Federal company. The Mowbray & Robinson Company is one of the largest oak lumber producers in the world, with over 200,000 feet per day at three units.

R. Connor Company Charges Misrepresentation

In a statement to the press W. D. Connor, well-known lumberman of Marshfield and Laona, Wis., regarding the indictment recently returned against the Connor interests by the federal grand jury at Milwaukee, alleging misrepresentation of shipments by the Connor people, blames the Soo road, which, he says, is trying to get out of certain contracts by appeal to the Interstate Commerce Commission. Mr. Connor says:

"On returning to Marshfield from the North, the article in the press regarding the indictment of the Connor Lumber Company and the Laona & Northern Railway Company was brought to my attention for the first time. I know very little about the action of the grand jury, excepting what has been stated in the press. When this matter was before the jury, we were refused an opportunity to have our contracts and agreements with the Soo line presented by our attorneys or to appear personally before the grand jury.

"We have a contract with the Soo line entered into prior to the building of the Laona & Northern railroad, by us in good faith, and the contract made as a protection to us before we incurred the expense of constructing the road. The contract was drawn by and entered into at the solicitation of the Soo line, the agreements contained therein made with the traffic department and the legal department of the road, and the contract executed by its president in January, 1902.

"For eight years the terms of the contract were carried out in apparently good faith by the parties thereto until in January, 1910, some one for the Soo line conceived the idea that the 'Soo company' could get out from under the responsibilities and obligations of that contract by appealing to the Interstate Commerce Commission and pleading that the contract was illegal.

"The questions involved were brought before the Interstate Commerce Commission, and finally, after about two years' waiting, a decision was rendered holding the contract legal in part and binding between common carriers. On some points, however, the commission held with the Soo line. On the questions that the commission held with the Soo line, the United States supreme court has since passed, and the decision of the supreme court held that the decision of the Interstate Commerce Commission was illegal.

"Since 1910 the railroad company in every way that experts could manipulate tariffs and classifications, has undertaken to get around complying with the terms of our contract and to overcome the decision in our favor by the Interstate Commerce Commission, and later, the decision of the United States supreme court. If the juggling of tariffs can be held lawful, and if the Interstate Commerce Commission approves of and encourages such procedure by railroads, if a railroad can waltz on its contract and disregard its every obligation, then no person is safe in dealing with a railroad company or in making any contract with its officers, from the danger of being dragged into court if it suits the convenience of the railroad company. Then we may expect the indictment and the result of the peculiar laws that can be called into service for the convenience of the railroads.

"We hope, however, to have a day in court when we can hope for a fair and judicial decision on these several questions, which we will accept in good faith whether it is for or against us."

Illustrating a Famous Shipment of Hardwood

The movement of an entire train of hardwood lumber by a single shipper is a noteworthy achievement under any condition of the market. Under existing market conditions it is of especial interest, and if it be the first shipment of hardwood lumber to pass westward through the Panama canal it is really historical in its significance.

Such a shipment was forwarded by the Ferguson & Palmer Company of Paducah, Ky., from its mills at New Houka, Miss., and that company may successfully claim the distinction of being the first shipper of hardwood lumber to utilize the great international waterway for the transportation of its product to Pacific coast points.

The shipment was loaded during the last days of October and was run special over the New Orleans, Mobile & Chicago railroad, "The Panama Route," from New Houka, Miss., to Mobile, Ala., where it was transferred to the S/S "Peter H. Crowell" of the Sudden & Christensen Line, sailing from that port on November 16 for Pacific coast ports via the Panama canal and is scheduled to arrive at San Francisco early in December.

The difference of thirty cents per hundredweight between the all-rail rate and the combination rail and water rate on this shipment resulted in a material saving in transportation charges, and serves to emphasize in a most forcible manner the benefits that will accrue to shippers of all classes of commodities from the opening of this new waterway.

This item of interest was noted in a previous issue of HARDWOOD RECORD, but is referred to again in connection with the illustration which the Ferguson & Palmer Company has just sent to this office.

Change of Address

E. A. Sterling, forest and timber engineer, formerly at 1331 Real Estate Trust building, Philadelphia, has taken new offices at 925 Commercial Trust building, same city. The change of address includes the firm of Clark, Lyford & Sterling and the Philadelphia & Vancouver Timber Company.

Vestal's Victory

Ed Vestal, the congenial and convivial secretary of the Vestal Lumber and Manufacturing Company of Knoxville, Tenn., landed in Chicago two weeks ago and soon was inquiring anxiously and mysteriously for information as to the best and quickest means of getting to Omaha. In fact, he carried this mysterious air a little too far. The consequence was that a number of hungry lumber salesmen became suspicious, believing that in some manner he had sighted a carload order for Knoxville. About train time the Twelfth street depot in Chicago was well crowded with commercial tourists whose jobs it is to talk entertainingly of the products of our forests. They all came determined to follow Ed as long as they were able to stand and to trail him to the treasure pot.

The disappointment was great when it was discovered that he had learned of their designs and had taken an earlier train, and their anxiety could hardly be contained until Ed arrived back in Chicago again the following Monday. The broad smile with which he greeted his friends when he stepped from the train sent their hearts down into their boots, as they knew he had accomplished that business for which he had made the trip and that further efforts on their part were useless. As they are all good fellows at heart they decided to give Ed the glad hand and congratulate him on his success, and appointed a spokesman to tender their heartiest congratulations. A rather unusual conversation then arose which went about as follows:

Spokesman (who believed that Ed had the order tucked securely in his wallet): "Ed, while you didn't play exactly fair with us in sneaking out on an early train last Wednesday, we all appreciate that it takes courage to accomplish what you have done and only hope that there won't be any kick when the goods are delivered."

Ed then replied with a patronizing smile which he bestowed impartially upon the entire circle of friends: "Yes, boys, he said I could have her."

The spokesman, wishing to extend his congratulations and well wishes a little farther and at the same time desiring to get a little more information so he could go after the next month's business at the same plant said: "I suppose it had to be sound stock."

Disgruntled salesman who had more acrimony than good fellowship feeling: "Well, Ed, I don't want to say anything that will discourage you, but I had had some dealings with that party myself and am a little bit afraid you have been handed a lemon. The old man is about as crabbed

FIRST SHIPMENT OF HARDWOOD LUMBER TO GO TO THE PACIFIC COAST VIA THE PANAMA CANAL

a proposition as you could find and he wants you to give him your whole bank roll before he comes to terms with you."

Ed (looking angrily at the new speaker): "Whadyamean, give my whole bank roll? Do you think I am arranging an across-the-ocean match with some count or other? Besides, who are you to call my fiancée a lemon?"

Then the secret was out. It seems that Ed had told the people back in the office, in order that the trip would not cost him anything personally, that it was a little business tour; that he was very anxious to see a prospective buyer back in Omaha. As a matter of fact he had just about completed arrangements with a certain young lady in that thriving city for their marriage in February. That is, the arrangements were completed with the exception of getting the consent of the prospective father-in-law, which ordeal Ed had been postponing from month to month for two or three years back. He finally decided, however, that as long as he had the task to perform he might as well face it now as any time and hence chose Thanksgiving day as the proper time for such an undertaking. He reasoned that were he successful in convincing his prospective father-in-law against the evidence to the contrary that he is an entirely desirable husband for that gentleman's daughter, it would be a proper occasion for thanksgiving, but that if he failed in this undertaking the churches at least would be open and he could apply there for consolation.

However, the reassuring smile which he carried all the way back with him and which we judge he still wears, told the story. Our only regret is that we did not have a court stenographer in attendance on this occasion, as we really believe Ed's appeal would be considered a valuable addition to the classic literature of this century. We tried to worm the gist of the conversation out of him, but he disclaimed absolutely any recollection of what he said or what answer he got. All he remembered, he says, is that when he entered the room where Mr. Prospective Father-in-Law was waiting he opened the conversation by saying: "Mr. Frantz, I have something to say to you." Anyway, he came out of the room alive, which to him is sufficient proof that his offer of his services as future son-in-law had been accepted.

The future Mrs. Vestal is the daughter of Robert Frantz of Omaha. The family originally came from Virginia and Mr. Frantz went West years ago at the request of his brother, ex-Governor Frantz of Oklahoma, who had settled in the West previously. He has lived out in that part of the country ever since. His daughter's name is Dorothy, and while no one connected with *HARDWOOD RECORD* has ever had the pleasure of meeting her, we know that Ed is a mighty discriminating individual and have drawn our own conclusions.

The wedding will take place in February, we believe, and the couple will reside at Knoxville in a fine new house which Ed has just about completed.

We almost forgot to say that he did sell some lumber in Omaha—four cars of it.

Death of Samuel H. Dyer

Samuel H. Dyer, one of the best known men in the eastern lumber field, died on December 1, at his home, Owen and Greenwood avenues, Lansdowne, Pa., a suburb of Philadelphia. Mr. Dyer started out for himself when quite a young man and learned the lumber business from the stump up. For some time he was connected with the Export Lumber Company of Boston, Mass., as inspector and loader of cargoes for foreign shipment, and for over fifteen years was associated with the Otter Creek Boom & Lumber Company as manager of sales, and was Philadelphia sales agent for the Atlantic Coast Lumber Corporation, which concerns jointly occupied offices in the Witherspoon building, Philadelphia. Mr. Dyer was a man of the highest integrity and greatly respected by everybody with whom he came in personal contact. His many business and personal friends extend their heartfelt sympathy to his bereaved family. He was fifty-four years old.

Otis Manufacturing Company Protests Mahogany Rates

Mahogany has been the victim of discrimination more flagrant than that which has been directed at any commodity which is hauled by the railroads, according to a brief filed last week by the Otis Manufacturing Company of New Orleans with the Interstate Commerce Commission. Between New Orleans and Dallas and Houston, Tex., the present rate is five cents over the Class D rates. The Otis company claims that the just rate should be five cents over the commodity rate applying on common lumber.

The case in which this matter is brought up is that of the Otis Manufacturing Company versus the Texas & New Orleans Railroad et al. The tariff governing these shipments places the rate on walnut, butternut, cherry and holly lumber five cents higher than the lumber rates (except cypress). This tariff names a rate of twenty-six cents New Orleans to Dallas on common lumber, making the rate on walnut and the other woods mentioned thirty-one cents. Mahogany is not given this rate. In the rate to Dallas it takes nineteen cents over the common lumber rating, or forty-five cents. The value of walnut is practically that of mahogany. The two have been given the same freight rates in other parts of the country.

Attention is called to the defendants' claim that the rate on common lumber to Texas points is greatly depressed. It is said to be subnormal, due to competition from the Pacific coast, but the Otis company claims that this is not the case. As Texas is a large producer of lumber, the business moving from other sections of the country is not of sufficient volume to have this influence on rates. Another argument of the carriers

is that in Western Classification territory mahogany takes the third class rate. This, the complaints declare, is simply an oversight in a district where no mahogany lumber moves. It is an absurdity that doubtless would be corrected if the attention of the proper authorities should be called to the matter.

One of the arguments used to show that the Dallas rate is unjust is that it costs seven cents a hundred more to ship mahogany to Dallas than to Omaha, Neb.

A second brief by the Otis company asks for lower rates from New Orleans to Sturgis and Grand Rapids, Mich.; Goshen, Kendallville, Shelbyville and Connersville, Ind. These rates vary from thirty to thirty-three cents at present. It is claimed that they should be twenty-six cents. This rate was in effect from Gulf ports other than New Orleans until recently.

It is pointed out that a carload of sugar, which is worth more than a carload of mahogany and in the handling of which greater transportation risk is incurred, takes a lower rate from New Orleans to Grand Rapids. It is pointed out further that the carriers maintain same rates from Memphis to New Orleans and other Gulf ports on hardwood lumber.

Marcus L. Brown Dead

Marcus L. Brown, for forty years in the lumber trade in Indianapolis and Chicago, died at his home, 6033 Woodlawn avenue, Chicago, Sunday, November 29. Mr. Brown was a veteran of the Civil war in the Second Ohio Volunteer Infantry. He was born near Moscow, O., November 27, 1841.

His widow, a daughter of Solomon Beard, a plow manufacturer of Richmond, Ind., a daughter, Alice E. Brown of Chicago, and a son, Arthur G. Brown, survive him.

Miles H. Wheeler Dead

Miles H. Wheeler of Neenah, Wis., who has been extensively interested in lumbering operations and who had amassed a considerable fortune in that line, died at Neenah about two weeks ago.

Mr. Wheeler was born in Clarenceville, Canada. He had resided in Neenah since he was twenty years old, being seventy-six years old at the time of his death. He leaves two daughters and a son.

Death of F. D. Bodeman

On November 11, at Nashville, Tenn., occurred the death of F. D. Bodeman, who had been known in the hardwood business since 1888. He began at Memphis, and spent most of his active life there. He was buried in Pine Crest Cemetery at Mobile, Ala., all members of his family being present. He leaves a mother, Mrs. S. L. Bodeman of Mobile; son Glenn of Denver, Colo.; two brothers, E. J. Bodeman of Little Rock, Ark., and E. C. Bodeman of Mobile, and one sister, Mrs. C. C. Moore of Memphis, Tenn.

Remarkable Veneer Logs

The accompanying is an illustration of the type of veneers from which the Sedro Veneer Company of Sedro-Woolley, Wash., manufactures its veneer stock. This is a representative carlot of Douglas fir logs which was shipped into the Sedro plant recently. The stock is manufactured into veneers and then into panels at the plant of this company.

These trees range in age from 400 to 500 years, and the consequent fine grain of the timber makes very beautiful figure.

Death of John T. Dixon

On Thanksgiving Day, November 26, 1914, John T. Dixon, owner and manager of the John T. Dixon Lumber Company, Elizabethton, Tenn., died in Rochester, Minn., where he had gone for treatment at the Mayo Clinic. His death was caused by pernicious anemia from unknown causes, from which he had suffered for many years.

Mr. Dixon was born in Baltimore, Md., on January 5, 1848. His boyhood days were spent in that city, where he began work as an office boy. In 1867 at the age of nineteen he went to western Maryland to take a position as weigh clerk at the mines near Lonaconing and later at Piedmont. In 1871 he went to Cumberland, Md., and entered the

VENEER LOGS CUT BY THE SEDRO VENEER COMPANY

canal supply business, operating a line of canal boats on the Chesapeake & Ohio canal, in which business he was engaged until 1886, when he went into the Cumberland Lumber Company of Ronceverte, W. Va., of which he was general manager. This company operated in white pine timber in Greenbrier and Pocahontas counties, which was floated down the Greenbrier river and sawed at Ronceverte. After the timber holdings of this company had been developed, he went into the hardwood business for himself. In November, 1901, he removed to Elizabethton, Tenn., where he did business under the name of The John T. Dixon Lumber Company up to the time of his death.

He was married in 1876 to Mrs. Helen V. Phelps, nee McCleary, who with two sons, Harlow S. and Hunter L., survives him. The two sons will continue the business under the old name of The John T. Dixon Lumber Company.

Mr. Dixon was a man who loved work and was successful, and he looked upon success as his reward. He had many friends wherever he had lived who regret to hear of his death and sympathize with the family in their bereavement.

Mr. Dixon was buried in Loudon Park cemetery in Baltimore, the city of his birth and boyhood, on December 1, 1914.

Pertinent Information

Rate Increase Suspended

It was announced on November 30 that increases in freight rate schedules to go into effect December 1 have been suspended until March 1. These tariffs include all advances in freight rates in Western Trunk Line territory. Those affecting class and commodity rates between the Missouri river and the Mississippi river, Chicago and St. Louis, and in a few instances rates affecting New England and eastern territory were also suspended. The effect of these suspensions will be felt by shippers in the territory between Chicago and St. Louis and the Atlantic seaboard on all commodities that originate west of the Mississippi river.

The reason for this suspension is that while the railroads claim in a general way that the advance represented an average of about only ten per cent increase, the investigation showed that some of the increases were as much as thirty-five per cent, and this especially on commodities entering directly into consumers' expenses.

Memphis Freight Hearing On Ohio River Increases for January

The hearing before the Interstate Commerce Commission in the case involving the proposed advance of 18 1/2 to 23 1/2 per cent on shipments of lumber and lumber products from points in the South to Ohio river crossings will be held in Memphis, January 13, and will continue about four days. These advances were suspended by the Interstate Commerce Commission some time ago until January 28, and it is planned to have the hearings and to determine the issue before the latter date. It is understood that, after the hearing has been completed at Memphis, there will be another at Birmingham and still another at Louisville, Ky.

The officials of the Southern Hardwood Traffic Association are making good progress in preparing the necessary data with which to combat the efforts of the roads to put this advance into effect. In this connection it may be stated that they have received the assurance of the hearty support and co-operation of the Cincinnati Lumbermen's Club, the lumbermen of Chattanooga and those of Cairo. In order that the showing may be made as strong as possible, the association has already secured the services of a prominent Chicago attorney, Luther Walter, who will assist J. R. Walker of Washington, the regular legal representative of the organization.

The lumbermen here feel that this advance is all out of proportion to anything that is justified and they are preparing to resist in every way possible. They realize that such an advance would seriously impair their business and would put them in position where they would not be able to compete for much of the business which has been offering north of the Ohio river.

Big Claims Allowed Against Iron Mountain

According to the report of Special Master Judge J. G. Wallace, which was filed in the United States district court clerk's office on December 2, the claims for overcharges against the Iron Mountain and Cotton Belt railroads, growing out of the Arkansas rate cases, aggregate more than one million dollars. The exact amounts allowed by the special master are \$845,433.86 against the Iron Mountain, and \$215,203.74 against the Cotton Belt. The number of passenger claims against the Iron Mountain was 4,091 and aggregated \$31,124.35, while the freight claims allowed by the special master numbered 61,573 and show a total claim of \$814,309.51. The passenger claims against the Cotton Belt, numbering 1,355, are for an aggregate of \$7,743.61, while the freight claims allowed, numbering 18,655, amount to \$208,160.13.

The railroad companies will be allowed twenty days in which to file exceptions to the master's report, at the end of which time the report will be up for confirmation by the United States district judge.

These claims for overcharge arose out of the famous Arkansas rate cases, which began in 1908 when the railroads of the state secured a temporary restraining order, later made a permanent injunction, by the

United States district court of this place, against the railroad commissioners of Arkansas, to prevent their enforcing the two-cent passenger fare rate as provided by an act of the General Assembly of the state in 1907, and the rate as provided by Standard Freight Distance Tariff No. 3, which was promulgated by the commission under authority of the 1907 legislature. Appeal was taken by the Arkansas Railroad Commission from the decision of the district court granting the injunction, and on July 18, 1913, the supreme court of the United States reversed the finding of the lower court, and dismissed the injunction. Immediately thereafter Judge Trieber, United States district judge, appointed Judge J. G. Wallace special master for receiving claims for refund from overcharges which had been made by the railroads during the pendency of the case, from September 3, 1908, to July 19, 1913. Since the decision by the supreme court the rates as provided by Standard Freight Distance Tariff No. 3 have been in force, with the revisions that were made by the commission. The two cent passenger fare rates have also been in force since that date.

In addition to the Iron Mountain and Cotton Belt there are about a half dozen small roads in the state, for which Judge Wallace was appointed special master. The claims against these roads, most of which have been taken over by the Iron Mountain since the litigation began, will amount to about \$100,000, according to the reports that are now about ready to be filed by Judge Wallace. The Rock Island refund case was compromised several months ago, and claimants have been paid thereunder by Special Master R. P. Allen in that case. In the Rock Island case the railroad paid to the Arkansas Railroad Commission, for the benefit of the shippers and consignors, the sum of \$190,000 in full settlement of all claims for refunds on freight shipments during the period of the litigation. After the claims were filed and pro rata figured, the claimants received thirty-seven and one half per cent of their claims. The refund for passenger fare overcharges on the Rock Island were paid in full, in assignable mileage, and aggregated something over \$12,000 worth.

New Arkansas Demurrage Rules

Believing that the state should have a better set of reciprocal demurrage rules, the Arkansas Railroad Commission has been engaged for several weeks in compiling a new set of rules, which are now completed. It is the intention of the railroad commissioners to have these new rules replace those now in force, and they will be incorporated into Standard Freight Distance Tariff No. 5, which has also been recently completed by the commission, and which will become effective on January 1, 1915. However, before taking final action on the new rules the commission will give the interested shippers, consignees and railroads an opportunity to offer such objections as they may have to the new rules, and December 7 has been designated as the date for hearing such complaints. If the objecting parties fail to convince the commission that the rules contain some unfair provisions the rules will be adopted as they now stand, which are as follows:

(a) If any person, firm or corporation desiring an empty car or cars to be placed at any station, siding, spur or other point on a railroad in this state, where it is usual and customary for freight to be received and discharged, to be loaded with freight for shipment and transportation from such station, siding, spur or other point, to any point on any other line of railway in this state, shall make application in writing for such car or cars to the agent of said railway company at the station, siding, spur or other point where it is desired to load such car or cars, or, if there be no agent at such point, then to the agent of the railway company at the station nearest to such point, where there is an agent, or to a conductor in charge of a freight train operating through said station, stating in such application the character of the freight and its destination, it shall be the duty of such railway company to whose agent or conductor such application is made to furnish and place, within the time hereinafter prescribed and at the point designated in said application, the car or cars so applied for, whether such car or cars are intended, when loaded, for transportation to a point on the line of such railway company or to a point on the line of another common carrier in the state of Arkansas.

(b) When a shipper makes a written application to a railroad company for empty cars as provided in section A of this rule, they shall be supplied within three days from 7 o'clock A. M. the day following such application; when for five cars, or less, within five days from 7 o'clock A. M. the day following such application; when for less than two or more than five cars, and when for ten cars or more, within eight days from 7 o'clock A. M. the day following such application.

(c) For failure to comply with the provisions of Section A and B of this rule, the railroad failing to supply the empty cars applied for shall forfeit and pay to the shipper the sum of \$1 per car each day or fraction thereof during which it fails to furnish cars after expiration of the time allowed for so doing, provided the application for said forfeiture is made in writing to the station agent or office of said company within thirty days after making request for such cars; and provided further that any shipper to avail himself of the benefits of this forfeiture herein provided, must at the time of making such application deposit \$2 for each car applied for, this money to be retained by the railroad company in case the car is not loaded, and in case the car is loaded the said \$2 shall be refunded to the shipper when bill of lading is issued.

The October Lumber Cut

The National Lumber Manufacturers' Association has published its report of lumber cut by members in October last. The following summary shows the result:

Cut October, 1913, 870,200,000 feet; cut October, 1914, 770,400,000 feet. Decrease, 99,800,000 feet, or 11 1/2 10%.

Shipments October, 1913, 839,000,000 feet; shipments October, 1914, 686,800,000 feet. Decrease, 152,200,000 feet, or 18 1/10%.

Cut October, 1913, 870,200,000 feet; shipments October, 1913, 839,000,000 feet. Cut more than shipped, 31,200,000 feet, or 3 7/10%.

Cut October, 1914, 770,400,000 feet; shipments October, 1914, 686,800,000 feet. Cut more than shipped, 83,600,000 feet, or 12 2/10%.

Bad Effect on Wood Alcohol Market

The New York College of Forestry at Syracuse announces, as a result of recent investigations of the wood distillation industry, that the removal of the tariff on grain alcohol has hurt the market for wood alcohol to such an extent that it is now hardly profitable to produce it. The chief products of the destructive distillation of wood are charcoal, wood alcohol and acetate of lime. Charcoal is used for gunpowder, for fuel in the manufacture of iron, and for various poultry and animal foods. Acetate of lime is used almost wholly in the dye industries. Wood alcohol is used largely as a solvent and for various chemical purposes. Beech, birch and maple are the best woods for the production of wood distillation products. Heartwood is better than sapwood because it does not contain so large a percentage of moisture. Elm, chestnut and cherry are not desirable woods for the wood distillation industry because they contain too much tannin, gums, etc.

Increased Lumber Sales in China

A recent consular report says that a large increase of lumber shipments to Hankow, China, has taken place, owing to the building operations necessitated by the burning of the native city during the revolution of 1911 and to the construction of new railways. Large quantities of timber for crossties, mostly Japanese, arrived at Hankow during the summer of 1913. The hardwood came mostly from Japan and Singapore; practically all the crossties are Japanese oak. Of the soft woods imported, those from the United States amounted to 14,054,714 superficial feet, or about two-thirds of the total import. American lumber imports consisted of Oregon pine, western red cedar, and California redwood.

Recognizing the Value of Wood

The London *Timber Trades Journal* insists on putting in a good word for wood as material for shipbuilding, and cites a particular instance in the present war. It says that when the cruiser *Hermes* was torpedoed, the wooden sheath kept her afloat for about two hours, and thus gave time for the saving of many lives. It is understood that she was struck by three torpedoes. If this was so, the benefit of the wooden sheath is the more remarkable, and suggests that the absence of this in more recent warships may have something to do with such heavy loss of life in both navies. Wood has, on many occasions, temporarily lost its birthright, but scarcely ever permanently. Is this, then, likely to be a return in part to the "wooden" walls which have proved their worth in days gone by? If not altogether, then in conjunction with armor plate.

Army Tent Pegs

The demand for army tent pegs has been enormously increased in Europe by the calling out of some 20,000,000 soldiers, many of whom are housed in tents. These pegs are made of ash, and are octagonal in section, being about two inches in diameter and eighteen inches long. A stout wrought-iron band is run around the head to save splitting, and a wedge-shaped point of similar metal is riveted on at the business end—a circular hole is drilled through the side of the peg, and the article is completed. It is not reported that orders for any of these pegs have come to America, but there is no reason why some of the excellent and abundant ash on this side of the sea might not find a market on the tented fields of Europe.

American Hardwoods in England

The London trade paper *Timber*, speaking of American hardwoods, says that the furniture trade being practically shut down for the present, business in such a wood as, for example, red gum, is practically dead. Some business is being done in oak boards of inferior grade, and for ash and elm there is an intermittent demand, which now and then has reached good proportions. Stocks of all kinds of American hardwoods in first hands are not at all abnormally heavy, and are not likely to be materially added to while so many mills are closed down in the United States.

Black Walnut for Musical Instruments

It is reported from some of the centers of musical instrument manufacture that the indications of black walnut revival are being watched with interest. Prospects point to the use of that wood, which is generally

acknowledged to be the finest American hardwood, becoming as universal as it was fifteen years ago. Since then it has dropped into the background in this country, though large quantities of it have regularly been exported abroad, the manufacturers of Great Britain and Germany having a high regard for that wood.

The reason for the interest of members of the music trades is that pianos and talking-machines made with walnut cases have long been popular, and in fact have been the chief sources of consumption for American walnut until the recent change in conditions in the furniture trade. The more general use of the wood in the furniture business will make it easier to sell walnut cases, as most purchasers buy pianos and talking-machines which harmonize with the rest of their furniture.

Various Uses for Sawdust

In Austria sawdust is mixed with tar to make fuel briquettes, of which one factory alone produces 7,000,000 a year. In Germany the sawdust is mixed with rye flour and made into a kind of bread, which is eaten by human beings as well as horses. One German bakery turns out 20,000 such loaves per day. In France sawdust is used for making dyes; in England it is placed in spittoons and in America it is shoveled under boilers to make steam.

Value of a Name

As a curious example of trouble which sometimes follows when American exporters do not carefully follow shipping instructions, it is said that on a shipment of ox yokes to Honduras the consigner was requested to declare them as agricultural implements, which are admitted to that country free of duty. These instructions were overlooked, and the shipper declared them as ox collars. There being no classification of that description they were classified and assessed as collars, taking a rate of twenty-one cents a pound. A correction was in time secured, but at much trouble.

Turkish Boxwood

Numerous trees known as boxwood grow in various parts of the world, but there is only one Turkish boxwood, and it has become so scarce that it costs ten times as much as mahogany. It has been planted all over southern and western Europe, but the wood grown there is lighter, and is inferior to the best that comes from the tree's native hills in Turkey and Persia. It grows in the same region that produces Circassian walnut, in the country south of the Caspian and Black seas. The tree seldom exceeds a height of twenty-five feet and a diameter of nine inches. Few logs are more than six feet long; and the majority that reach market are three or four feet long, and less than five inches in diameter at the big end. They are nothing more than large clubs, in size and shape. In fact, it is probable that the club which Hercules is armed with in books on mythology was fashioned after a boxwood billet of common form. The ancients were well acquainted with boxwood and used it for carvings.

The wood is yellow. High-grade (not cheap) carpenter rulers are made of it, and the color never fades. No sapwood is used, for the very good reason that there is none. It is a peculiar wood in that respect. Many kinds of trees have little or no heartwood, but few lack sapwood. The boxwood may have a layer of sap of the thickness of writing paper.

Planted trees in Europe and America grow with fair rapidity, and the annual rings are fairly distinct; but on its native hills its growth is very slow and the yearly rings scarcely visible. The wood varies greatly in weight; some of it is little heavier than hard maple, other sinks at once if dropped into water. It is very hard, but does not measure up with *Hymenocytus* or ebony. It is about as hard as lilac.

The chief use of boxwood at present is by wood engravers who make cuts for the printing press. The old style "wood cut" was made with boxwood. Less of that class of illustrating is used now than formerly, because half-tones and zinc etchings can be made much more cheaply. Blocks for the engraver, if more than three or four inches square, must be made by splitting small blocks together.

Manufacturers of roller skates are large buyers of Turkish boxwood. Shuttle makers used to buy it, but it costs too much now. It is so scarce that trees are dug out and the roots made use of.

Boxwood from the West Indies is replacing the Turkish article, except where the best is demanded. The two woods look much alike, but the West Indies trees are larger, and the wood is of less pleasing color.

Feed Water Difficulties

"The problem of suitable feed water, although less serious in New England than in other parts of the country, is still a trouble-maker in many plants. The formation of scale and the softening of water are due to the simplest of chemical reactions, and by an analysis of the water a competent chemist can readily predict in advance the proper amounts of suitable chemicals necessary to prevent scale or corrosion, and not only save the company the expense of frequent boring and replacing of tubes but obviate the necessity of attempting to force heat through the same substance with which many of your steam lines are insulated. The services of a chemist," said Carl F. Woods, secretary of the firm of Arthur D. Little, Inc., Boston, when speaking before a group of street railway operators, "would prevent the purchase of a special compound at \$1,000 a year which consisted of ninety-seven per cent water and three per cent molasses, or obviate the necessity of purchasing a mixture of soda ash, tannin and water under a brand name at eight cents a pound when the principal ingredient can be obtained for one cent a pound."

Sale for Forest Tree Seed

It would be difficult to say how many bushels of forest tree seed find sale yearly in the United States for planting purposes, but the quantity is large, and includes the seeds of both hardwoods and soft woods. Nurseries are the largest buyers, but many private purchasers swell the total. Most forest tree seeds, or at least large quantities, have come from Germany. Even the seeds of white pine and Douglas fir, which are strictly American trees, have been coming from Germany, after being collected from planted trees. Nursery stock of the same species, and of many others, has been supplied from Germany. Imports from there are now cut off, and it seems wholly unlikely that supplies can arrive in time for next year's planting. America should be able to supply tree seeds for its own people. All the kinds wanted are grown here, and there should be no serious obstacles in the way of collecting and marketing them. The government collects such as it needs for planting on lands of its own, but it will not be able to spare many seeds for private nurseries.

Wood Oil for Varnish

The Chinese at Hankow make considerable quantities of wood oil which is used in the manufacture of varnishes. The United States is one of the best customers for the oil. At the beginning of the European war the price in Hankow was \$3.66 per 100 pounds. It fell soon after to \$2.97; but it recovered and went higher than before. The latest quotations list the oil at \$4.12. The rise in price is said to have been caused by large purchases in the Chinese markets by Japanese merchants.

Arkansas Forest Fires

The newspapers report that recent forest fires in Arkansas have done little damage because most of the burning was confined to brush lands, and that which ran through pine forests did not burn mature timber. That is one way of looking at it, but it relates to the present only. It is a mistake to suppose that no harm results from burning small growth. Such growth will some time become timber, if let alone. It is equally erroneous to suppose that fire can pass through mature pine forest without doing damage. It kills the seedlings, and thereby kills the future forest.

John M. Byrne, president of the J. M. Byrne Lumber Company, Kansas City, Mo., died on November 29 at his home at 3673 Janssen place, Kansas City.

James Gilles, Preston, Ont., is reported to be planning the manufacture of sash, window frames, etc., and to be in the market for machinery of that type.

The Paducah Lumber Company has been incorporated at Paducah, Ky., with a \$25,000 capital. The articles of incorporation were filed by A. W. Lucas, of Paducah.

At Wilmington, Del., the Gustav Franklin Company has been organized to manufacture household, garden and table furniture, H. E. Latter being one of the interested parties.

W. H. Richardson has gone into business at Racine, Wis., to manufacture vehicles and implements. The style of his concern is the Racine Carriage Company, with a capital of \$25,000.

The Wing & Fiegel Box Company has been organized at Bangor, Me., with a capital of \$50,000. Its purpose is to own and lease timberlands, and Osgood S. Townsend is president of the company.

Goehring Manufacturing Company, Akron, O., manufacturer of sash, doors, blinds, etc., has changed its name to the Brown-Graves-Vincent Company, and increased its capital to \$200,000.

It is estimated that fires in Pennsylvania forests have caused damage to the extent of about \$450,000. This summary was made by the Department of Forestry. The summary shows that 241,486 acres were burned.

< CHICAGO >

E. M. Vestal of the Vestal Lumber & Manufacturing Company, Knoxville, Tenn., passed through Chicago, November 30, on his way back to Knoxville from Omaha. Mr. Vestal was successful in placing some good orders at Omaha, and has written *HARDWOOD RECORD* from other points at which he has stopped after leaving Chicago, reporting equally as satisfactory results from his efforts.

E. D. Galloway of the Galloway-Pease Company, Saginaw, Mich., and Poplar Bluff, Mo., was in town about a week ago in conference with M. L. Pease.

W. W. Dings of the Garetson-Greason Lumber Company, St. Louis, Mo., spent a few days around Chicago recently.

C. B. Allen, manager of the veneer department of the Anderson-Tully Company, Memphis, Tenn., has been spending the last week with the Chicago trade.

The H. P. Nelson Company, Chicago, Ill., manufacturer of pianos, has filed a voluntary petition in bankruptcy.

J. H. Himmelberger, president of the Himmelberger-Harrison Lumber Company, Cape Girardeau, Mo., stopped off in Chicago last week.

A. H. Norwest & Co. have commenced business at 1910 North Campbell avenue, Chicago, to manufacture furniture.

The Pilsen Screen Company and the Englewood Desk Company, both of Chicago, have filed involuntary petitions in bankruptcy.

< NEW YORK >

Announcement has been made of the engagement of Herbert Sumner and Miss Ethelynd Louise Nostrand. Mr. Sumner is one of the younger set of wholesale lumbermen of the city. The bride elect is well known socially in Brooklyn.

R. M. Lockwood of the Memphis Hardwood Flooring Company, accompanied by Mrs. Lockwood, spent several days in town last week. He says everything is fine at the plant and the new heavy machines are doing all that is expected of them.

C. W. Manning, local wholesale dealer in hardwoods, reports a better tone to things generally though the present demand is not brisk. He is just back from an extended business trip and encountered more encouraging signs than have been evident of late. Prices are still very uncertain and far from satisfactory. Gum lumber seems to be in better demand and prices for this stock are gradually improving.

E. S. Foster is continuing in the wholesale hardwood business at 81 East One Hundred Twenty-fifth street, the Woodbury-Foster Lumber Company having discontinued.

< BUFFALO >

Shirley G. Taylor of Taylor & Crate, accompanied by his wife, has gone South and though his trip is mainly a business one, they will stop for some time in New Orleans before returning. The company has not sold any of its cotton crop yet, but hopes to get a fair price for it. Its Mississippi sawmills are shut down at present.

The Buffalo Hardwood Lumber Company has been busy lately, having taken on a special order for nearly 1,500,000 feet of stock, which has to be shipped within the next few weeks.

R. D. McLean sailed for Cuba early this month on a business trip in the interests of the McLean Mahogany & Cedar Company. The company has lately taken an office in the White building.

Anthony Miller states that the hardwood trade has shown no improvement during the past month and that little stock is now being received. Conditions are not likely to show much change this month.

Blakeslee, Perrin & Darling are selling a pretty fair amount of cypress at present. The hardwood trade has not shown much improvement, though a better feeling prevails among buyers.

O. E. Yeager is attending the Rivers' & Harbors' Congress at Washington on December 9-11. The office of the Yeager Lumber Company states that cypress is in fair demand.

The H. T. Kerr Lumber Company is bringing down a stock of maple from the Mackinaw district of Michigan, but will leave the bulk of it for lake shipment next season.

W. K. Jackson has gone to the mills of Jackson & Tindle in Michigan for a short business trip. A new mill has lately been put up at Pellston to replace one that was burned.

F. M. Sullivan has been in Chicago lately on a business trip. T. Sullivan & Co. received one of the last of the lake cargoes of hardwoods to arrive here this season.

The Hugh McLean Lumber Company is doing some hardwood export business at present, but it is reported that since the war a big advance has been made in ocean freight rates, thus interfering with many shipments.

The project for an exposition building at Jamestown to accommodate exhibits of furniture is making some headway and the manufacturers have been assured a large sum toward its erection. Jamestown is an important furniture market and the new building would be a great help to the marketing of the furniture output.

A "Lumberman's Acquaintance Day" was announced to be held at the Chamber of Commerce on December 4, and a letter from President A. W. Kreinheder, of the Buffalo Lumber Exchange, urged every lumberman to be present and bring others with him. On the acquaintance committee of the Chamber of Commerce which looked after the affair were the following lumbermen: Charles N. Perrin, J. S. Hayward and John R. O'Toole.

◀ PHILADELPHIA ▶

A. S. Arthur, for many years connected with Pittsburgh lumber firms, has associated himself with the Highland Lumber Company, Inc., Seth, W. Va. He will look after the Philadelphia and surrounding trade and assist in the office work here. Mr. Arthur is one of the best-known young lumbermen in this field and his many friends will give him a warm welcome.

Harry Russell, for many years the head of Henry C. Patterson & Co., and later of Howes & Russell, has associated himself with the C. J. Decker Company, hardwoods, Asheville, N. C., which has opened office in the Bellevue-Court building, this city. Mr. Russell will be connected with the sales department.

The Philadelphia Hardwood Lumber Company, located for some years in the Real Estate Trust bulding, has retired from business.

The Henrico Lumber Company, Eugene W. Fry, president; Southern Transportation Company, of which Mr. Fry is treasurer and active head, and the Jessup & Moore Paper Company, E. W. Fry, vice-president, have jointly taken the whole of the eighteenth and part of the seventeenth floors in the new section of the Commercial Trust building, Fifteenth and Market streets. They are extensive manufacturers of Maryland lumber and pulp wood.

Frederick S. Underhill of Wistar, Underhill & Nixon, says they are getting a number of inquiries and some fair orders are booked. Prices, however, at this end remain unchanged while manufacturers of lumber are curtailing their output and asking stiffer prices in some lines.

Franklin A. Smith's Son, with large yard and mill located on the Schuylkill river below Spruce street, has sold out his entire business, yard, lumber, tools, etc., to the Yellow Pine Company of Philadelphia. J. Edward Smith, proprietor of the above business, has decided to take a much needed rest before again entering business. He is still associated with the Producers' Lumber Company.

J. E. Smith, Jr., son of the proprietor of Franklin A. Smith's Son, and formerly associated with this concern, was married to Miss Beatrice Myers on November 18. After a short honeymoon trip they are now settled at their home, 921 South Fifty-fourth street. Mr. Smith, now associated with the Producers' Lumber Company, is one of the popular young lumbermen in this city.

R. G. Scudder & Son, Camden, N. J., have removed their yard to White Horse Pike and City Line, in South Camden.

The Carolina Lumber Company, this city, was adjudged an involuntary bankrupt on November 23.

The Parke Noble Lumber Company, Jersey City, N. J., obtained a charter under New Jersey laws November 24. Capital, \$100,000.

◀ PITTSBURGH ▶

The Universal Lumber Company has been organized by Aaron and Samuel J. Horvitz and William Lichtenstul of Pittsburgh to do a general lumber business in this city.

The Pittsburgh Industrial Development Commission is now represented

Indiana Oak

GUARANTEED

Do you remember from experience in the old days, that peculiar satisfaction in working the rich, mellow softness and smoothness of *real* INDIANA OAK?

You are probably leary of that term now as you don't *know* the origin of the stock purported to grow in this state.

In fact that very misrepresentation is the strongest endorsement of INDIANA OAK as the oak.

You would like to again experience that satisfaction if you could know that the stock you are offered is *just what you used to get*.

Your customers would be pleased if their goods showed that quiet beauty and even color and figure that for all time has given to goods made from INDIANA OAK an Individuality.

You can *please them again*. How?

Simply by buying a parcel of almost anything in lumber or Veneers from our yards. You can select from a full assortment. We positively carry no Southern stock and can prove it.

And remember—We have built up our business by giving

Just a little better quality than you expect

LEXINGTON, KY.

BAND MILLS: Quicksand, Ky., Straight Creek, Ky.

in London. Its agent, J. Rogers Flannery, has opened offices at 64 Victoria street and is lining up some big European orders for Pittsburgh firms.

It is reported that the Pittsburgh Plate Glass Company has sold the entire output of its Ford City, Pa., plant for the coming year. It is now making extensive additions to its plant. The company is one of the largest buyers of lumber in Pittsburgh.

The Greenville Steel Car Company of Greenville, Pa., which is a big buyer of lumber from Pittsburgh firms, has started work on an addition 90x400 feet to its plant.

Fisher & Besnecker are starting a new carriage works at Evans City, Pa., to replace the old Laderer factory which was lately moved to Zelienople, Pa.

The Central Pennsylvania Lumber Company now has 23,000,000 feet of lumber in its yards at Sheffield, Pa., as compared with 38,000,000 feet, which is a high water mark.

W. B. Wagner of Heshbon, Pa., has bought a tract of hardwood timber in Jackson township, Cambria county, Pa., which is estimated to cut 1,500,000 feet of lumber and 125 cars of mine posts. Operations will be started at once.

The Babcock Lumber & Land Company, of this city, has been granted full title to 10,000 acres of the finest timberland in Tennessee and North Carolina, after twenty years' litigation in city and federal courts. The property is valued at \$500,000.

J. G. Marks of Altoona, Pa., has bought the planing mill and lumber yard of Edward O'Brien at Cresson, Pa., for \$25,000.

The Whites Creek Lumber Company of Somerset, Pa., has applied for decree of dissolution and December 7 is set as the day for hearing the case.

The Eiler Lumber & Mill Company, southside, Pittsburgh, Pa., whose plant was burned a few weeks ago with loss of \$75,000, is stocking up a big yard with a splendid lot of hardwood and pine lumber and will be fully equipped to take care of its old trade by December 1.

The Wise Lumber Company of Pittsburgh, has been organized by Leslie W. M. Wise, Charles L. Reinkenstein and Eugene B. Strassburger of this city to do a general lumber business.

J. N. Woollett, president of the Aberdeen Lumber Company, traveled through the South recently on a two weeks' trip. He found manufacturers there in very low spirits.

J. E. Houck of Watsonstown, Pa., has bought a valuable tract here of virgin hardwood timberlands near Markesburg, Pa., and will cut it off at once.

< BOSTON >

The twenty-fifth annual meeting of the Massachusetts Wholesale Lumber Association was held at Young's Hotel, Boston, on December 2, and two well-known hardwood men were elected to principal offices, viz: William E. Litchfield, president, and Charles S. Wentworth, vice-president. E. C. Hammond was elected secretary and treasurer, with Arthur M. Moore assistant secretary and treasurer. The new charge for stop-over service by the railroads, which applies on so much lumber shipped from the South and West to New England was considered, with some difference of opinion as to whether it was proper or excessive or even called for at all. The growing policy of consideration for the railroads was noticeable. After discussion and action on a number of other matters, the committee on incorporation reported as not favoring any change in the form of the association, but continuing as heretofore for the transaction of such business as the association might undertake. After adjournment, however, nearly every member remained for an informal meeting for the construction and incorporation of a new lumber association, laid down on different lines and designed to handle more effectively the new conditions and problems in the local trade. A committee was appointed to apply for a charter from the state of Massachusetts, and arrange matters for an organization meeting and election of officers. This will be held in the near future.

The sympathy of the entire trade is accorded Hon. John M. Woods in the death of his wife, Almira J. Woods. She passed away on December 3, after a long illness, and the funeral was held at their residence in Somerville on December 5, the interment being at Mt. Auburn.

Two new hardwood using industries are noted in the incorporations this week: The Warren Clock Company, with capital of \$50,000 at Portland, Me., and the Oakville Wagon Works at Watertown, Conn., with capital of \$25,000.

The Forest City Lumber Company has been organized at Portland, Me., with a capital of \$10,000.

< BALTIMORE >

John T. Dixon, head of the well-known firm of John T. Dixon Lumber Company, Elizabethton, Tenn., who died in Rochester, Minn., on November 26, was buried December 1 from the home of his brother, William E. Dixon, 1823 West Saratoga street, Baltimore. Interment was in Loudon Park cemetery. Mr. Dixon was sixty-six years old and is survived by his wife, two sons, Harlow S. and Hunter L. Dixon, two sisters and two brothers.

Clarence Cochran, a popular salesman who has been for years connected with the R. E. Wood Lumber Company, was married recently to Mrs. Florence A. Leydon, a widow of Rochester, N. Y. Mr. Cochran has been a widower for some years. He was showered with congratulations by the

office force, who attended the ceremony. Mrs. Cochran is expected to come to Baltimore to live as soon as she has arranged some matters that require her attention in Rochester.

The ship yard and three sawmills of Joseph W. Brooks, at Madison, Dorchester county, on the eastern shore of Maryland, were destroyed by fire on Friday night of last week, with a loss of about \$12,000. There is said to have been no insurance on the property.

Mann & Parker, Inc., wholesale dealers in hardwoods, who recently moved to their new yard on President street, running through to East Falls avenue, are erecting a large shed there, having just completed a commodious one-story brick office. They are rapidly getting in their stock and expect to have a full assortment of hardwoods here for immediate delivery.

George W. Eisenhauer of the Eisenhauer-MacLea Company, has gone to Summit, in the Blue Ridge mountains, for the winter. Mr. Eisenhauer's health has not been good for some time, and lately his condition had become so unsatisfactory that he concluded only a change of climate could benefit him. The humidity and penetrating cold of the Baltimore winters threatened to keep him confined to the house all the time, and he resolved to see what the high altitude and dry air of the mountains would do for him. Meanwhile Daniel MacLea is giving close attention to the details of the business.

J. M. D. Heald of Price & Heald, wholesale hardwoods, Knickerbocker building, who was operated on some weeks ago, has so far recovered that he is able to take rides about the city and he has also visited his office several times. There is every prospect that he will be able shortly to resume active work.

◀ COLUMBUS ▶

According to the report of the Columbus building inspector for the month of November there were 141 permits issued for a valuation of \$377,385, as compared with 175 permits and a valuation of \$398,770 for November of 1913.

The Clay City Bending Company of Zanesville has been incorporated with a capital of \$5,000 to manufacture wooden products. Andrew Kimble, Ross H. Kimble, F. A. Kimble, F. C. Kimble and J. E. Kimble are the incorporators.

The annual convention of the National Association of Builders' Exchanges of the United States will be held at the Virginia hotel, Columbus, January 26 to 28 inclusive. J. M. Vollmer of Louisville is secretary of the organization.

The Forest Lumber Company of Forest, O., has been incorporated with a capital of \$10,000 to deal in lumber and building materials, by William H. Thornhill, Peter Kuntz, Martin Kuntz, G. F. Hill, H. C. Diefenbach and J. K. Payne. The company takes over the business formerly conducted under the name of G. W. Fox & Co.

At Erhart, O., the J. F. Hawry Bending Works has ceased operations.

The statement is given out by the state fire marshal that barring any large losses up to the end of the year, the total fire losses in the Buckeye state for the present year will be the smallest in years. The losses have been especially small during the past several months.

The Allen Lumber Company is the name of a new concern which has taken over the business of Charles F. Allen at Sabina, O.

The Pemberville Lumber Company of Pemberville, O., which was recently organized, will erect a planing mill and sheds.

The W. M. Ritter Lumber Company of Columbus has placed J. A. Walton in charge of Cleveland territory as salesman to take the place of H. P. Blake.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, reports an improvement in the hardwood trade in Columbus and central Ohio. Buying is better on the part of factories and the feeling in the trade shows improvement. Factories making furniture and vehicles are buying rather freely. Dealers' stocks are not large and they are loath to increase them under the circumstances. Prices have been fairly well maintained at the levels which have prevailed for some time.

J. A. Ford of the Imperial Lumber Company reports a better demand for the full line of hardwoods with future prospects appearing better.

Dealers in millwork are having a fairly nice run of business. This is due largely to the favorable weather which has permitted active building operations later than usual.

◀ TOLEDO ▶

An event of considerable note is the annual banquet given recently by the National Pole Company of Escanaba, Mich., at the Boody House, in this city, to high officials of the concerns which are its chief customers. It was stated that practically all of the twenty-five guests who enjoyed the spread were able to write acceptable checks for amounts requiring six figures. This banquet is in the form of a game dinner and is a yearly event, although on former occasions Chicago and New York have furnished the setting. The concern has a branch office in Toledo, in charge of J. E. Zeluff.

The Toledo Lumber & Sash & Door Company is a new organization, made up of practically all the lumber and sash and door interests in the city. Meetings are held once a month at the Commerce Club and discussions of general interest to the trade are indulged in. This is one of the features of the Commerce Club of Toledo, and many business interests hold these

friendly meetings. The officers of the new organization are: President, B. A. Stevens; secretary, Allen A. Smith.

The Booth Column Company is running light just at present, as orders have not been coming in as well as could be hoped recently. President Booth has a hopeful outlook, however, and predicts a heavy business a little later on after the inventories have been taken.

The Skinner Bending Company reports business a little slow at present, but states that this is practically a normal condition for the season.

— < INDIANAPOLIS > —

Philip C. Braun has been appointed receiver for the Ohio Valley Coffin Company, Lawrenceburg. The company is said to be solvent.

Mr. and Mrs. John H. Talge celebrated the twenty-fifth anniversary of their marriage December 2. Mr. Talge is president of the Talge Mahogany Company.

The factory of the Browdues Buggy Company, Martinsville, suffered a heavy loss by fire December 3. The origin of the fire has not been learned. The loss is partly covered by insurance.

Building operations in the city last month amounted to \$265,190, as compared with \$479,711 in November, 1913. Building has shown some improvement so far this month.

The National Quartered Oak Veneer Club expects to meet during the convention of the national association in Chicago, December 8. The Indianapolis Quartered Oak Veneer Club will hold its next meeting early in January.

— < MEMPHIS > —

As giving some idea of the smallness of the movement of timber in this part of the country, it may be stated on the authority of one of the officials of the Valley Log Loading Company that it is not handling more than twenty per cent of normal for this time of year. As a rule this company, which loads a large percentage of the timber brought to Memphis by rail and that likewise goes to a number of other milling centers in this section, is doing a very active business, as mills are making every effort to get a full supply of timber at their plants for their winter run. The stoppage of logging operations, however, as a result of the war in Europe, has resulted in a very limited amount of timber being offered to this or any other company for loading, and prospects are far from bright for a return to normal within the near future. As a matter of fact, it is conceded by hardwood lumber interests that the winter has already set in and that it is likely to be quite difficult to get out any timber of consequence until next spring. This view is very strongly held and is modified only by the possibility that there may be a milder winter than has been experienced in other years. It is pointed out that there has been comparatively little rain in this territory for the past three or four months and that considerable is due if the season is to average itself. It may also be stated in this connection that the firms which have their own loading facilities are accomplishing very little, so that, altogether, it may be said with authority that the movement of timber throughout the Mississippi valley region is extremely small.

Daniel E. Gore of Chicago, general chairman of the International Trade Conference, has appointed three Memphians as members of committees which will seek to carry out the work started by the meeting at Memphis two weeks ago. This conference has for its specific purpose the furthering of business relations between the people of the Mississippi valley states and those of Latin America. J. A. Goodman, president of the Commercial Trust & Savings Bank, is a member of the banking committee, while W. H. Russe of Russe & Burgess, Inc., is a member of the executive committee. Mr. Russe has been directly connected with the export business during a number of years and has heretofore sold the output of his firm very largely in Europe. The closing of the European markets by the war has made it desirable to secure new outlets, and for this reason Mr. Russe and other members engaged in the export trade have taken a very active interest in the conference and the purpose for which it has been launched. The appointment of Mr. Russe is regarded as an excellent one, as he is a man of large executive ability and has had much experience in dealing with problems of the character now confronting the conference.

Consolidation of the Louisiana, Arkansas & Gulf Railroad and the Ashley, Drew & Northern Railway, both Arkansas short lines, has become effective. The former has been in the hands of a receiver for some time, but this consolidation effectually puts an end to this procedure. J. M. Parker, former general manager of the Louisiana, Arkansas & Gulf, as well as receiver for that road, has become general manager of the consolidated lines. As a result of this consolidation it is proposed to rush to completion extension of the line from Crossett to Pine Bluff, where important connections will be made. These two roads have connections with the St. Louis, Iron Mountain & Southern, the Cotton Belt, the Rock Island System and the Frisco System at numerous points in Arkansas, and the two component roads have been quite important factors in the development of the timber resources in the territory through which they pass.

The Rockwell Manufacturing Company, Camden, Ark., which has been operating on half time for quite awhile, started on full time this week. It is announced that, after January 1, the company will put on night and day crews and work on double shift. It is engaged in the manufacture of screen doors and chairs.

The outlook for building operations is very much brighter, according to Dan Newton, building commissioner. He says that 1914 has proven

quite disappointing because of conditions which have been unfavorable for activity along this line. He says, however, that there are a number of costly structures which will be erected in the central part of the city in the near future and that plans have already been drawn for a number of manufacturing plants to be located in the industrial centers in or adjacent to Memphis. Architects here say that there is promise of greater activity than has been seen for some time and that they have been called upon to do a great deal more work recently. Contractors are also getting busier. Manufacturers of building materials of all kinds report that there is more demand for their output, particularly for delivery after the first of the new year. It is not anticipated that there will be very much increase in building activity during December, but practically all authorities in touch with conditions here believe that there will be a decided change for the better after the new year begins.

The Crystal Springs Manufacturing Company, Crystal Springs, Miss., has been incorporated and articles of incorporation have been filed with the county clerk of Berrien county, Michigan. The principal offices of the company will be at Crystal Springs, while the Michigan office will be at St. Joseph. The company, in its present form, is owned by Michigan interests. It will have its plant at Crystal Springs and will buy, sell, manufacture and trade in all kinds of lumber, veneer, fruit and produce packages, box shooks and crates. The capital stock is \$50,000.

The Sudden-Christensen Steamship Company is putting five steamers in the Mississippi valley trade to run from New Orleans and Mobile via the Panama canal to San Pedro and San Francisco. Sailing dates will be the tenth of each month from Mobile and the fifteenth from New Orleans. Capt. I. N. Hibberd, general manager, has been spending some time in Memphis recently with a view to securing large enough tonnage to justify the beginning of operations. He says that he expects no trouble in accomplishing this purpose. He points out that the greater portion of the tonnage will be hardwood lumber and lumber products. The transcontinental roads are making an effort to secure a rate of eighty cents from Memphis to Pacific coast points on these products, while the rate via the Panama canal is fifty-three cents, a difference in favor of the steamship lines of twenty-seven cents. Capt. Hibberd believes that this is sufficiently large to get the business and he is very much encouraged over the outlook.

The Henry Maley Lumber Company, which recently decided to remove its plant from Yazoo City to Jackson, Miss., has already begun the necessary grading and has received some of the machinery. The latter has already been ordered and will be delivered at an early date. It is planned to have the plant in operation at the new location in about sixty days.

A. B. Newman of Chicago, and associates, have been spending some time in Arkansas recently, going over the properties which they acquired a short time ago from the Triangle Lumber Company at Cliflo. Included in the transfer were the big sawmill and hardwood plant, 42,000 acres of timber, and the Anderson & Saline River Railway, a line twenty-one miles in length. It is the intention of these gentlemen to undertake the early development of the properties in question. They want to get the timber removed from the land and cut the latter up into small tracts to be rented or leased for trucking and other agricultural interests. Something definite in connection with the plans of these gentlemen may be expected at an early date.

— < NASHVILLE > —

The Nashville Lumbermen's Club at the last weekly meeting decided to change the hour of holding meetings to 6 o'clock in the evening and to hold two meetings monthly instead of weekly meetings. President Henderson Baker presided, and was instructed to appoint a committee to arrange programs for the meetings. Hamilton Love, T. R. LeSueur and Chas. M. Morford were named. The committee will select speakers and get up live programs for the meetings. Some of the lumbermen at the meeting reported more inquiries and signs of improvement, while many reported trade quiet and unchanged.

A new heading factory has started at Centreville, Tenn., turning out 25,000 pieces the first day, and the Buckeye Spoke Company at the same place, which has been closed down for several weeks, has resumed operation. Houston & Liggett of Columbia, Tenn., are having a new slat mill erected at Chapel Hill, Tenn., and will build about twenty-five houses for homes for employes.

The Chestnut Lumber Company, which has business here, has registered its charter in this county. The company was organized in Alabama, with \$5,000 capital stock, and is composed of R. N. Chestnut, Sr., R. N. Chestnut, Jr., Omar Chestnut, B. T. Campbell and John C. Jared.

George W. Steagall, who was for many years a prominent lumber dealer and manufacturer at Tullahoma, Tenn., died at the home of his daughter, Mrs. B. K. Kingree, in Shelbyville. Mr. Steagall operated large plants at Tullahoma for many years. The remains were taken to Tullahoma for interment.

— < BRISTOL > —

Beveridge & Taylor, Inc., of this city, who last week purchased an additional boundary of timber near Glade Spring, Washington county, Va., is preparing to at once install mills. The firm is confident that business will be better in the spring and, acting upon this belief, is going ahead with its plans.

The Pittsburgh Lumber Company, which has a large mill at Hampton,

Tenn., is one of the few large manufacturers in this section still operating. The company is working part of the time at night.

The Atkins Lumber Company will soon have its new mill at Atkins, Va., ready for operation. The company will cut about 40,000 feet of hardwood stock daily. The railroad is now about completed. H. G. Guyan of Humbert, Pa., is largely interested in the development, having purchased an area of 21,000 acres of timber for the company, estimated to be a fifteen-year cut.

A distinct shock to the hardwood men of this section was the death at Rochester, Minn., a few days ago of John T. Dixon of the John T. Dixon Lumber Company of Elizabethton, Tenn., who had gone there for an operation. His body was returned to Elizabethton for burial. He had for a

number of years been prominently identified with the hardwood industry in this section and, previous to coming to Elizabethton, at Ronceverte, W. Va. He is survived by his widow and two sons—Hunter L. and Harlow S. Dixon. He leaves a large estate. He was well known in lumber circles in the East, where he formerly had important connections.

There is little doing at this time among the mills of Bristol, except one or two planing mills. The lumbermen here are "taking it easy," to use the expression of one of them, until business picks up, which they think is not far distant.

One of the largest lumber purchases that has been made in this section in a long while and one that is important, in view of existing business conditions, was made by Eugene Galyon of the Knoxville Lumber & Manufacturing Company. It consists of seven train loads, or 145 cars.

—< LOUISVILLE >—

The Louisville Hardwood Club heard a most interesting and enlightening talk recently on the operations of the Federal reserve law by Henry D. Ormsby, cashier of the National Bank of Kentucky, the largest bank in Louisville. Mr. Ormsby described the law itself, incidentally saying that

HARDWOOD LUMBER AND LOGS MISS.

the Aldrich-Vreeland measure, its immediate predecessor, had proved its value, and that the issue of emergency currency under it had undoubtedly prevented a very serious situation during the past fall. He said that one of the benefits of the new law is the release of over \$200,000,000 of currency which has heretofore been kept as reserves by various banks. The reserve limit has been reduced by the measure, enabling this great amount of money, which in many cases has been kept in the vaults, to be put to use. He also predicted that lumbermen and other business men would ultimately be saved a great deal of money by reason of making all checks of banks members of the Federal reserve system worth par anywhere in the country, thus eliminating collection charges. The lumbermen listened with keen interest to the address, and following it Mr. Ormsby answered a number of questions relative to various phases of the new banking system.

Some talk of the establishment of a traffic bureau by local lumbermen has been going the rounds of late as the result of the numerous railroad rate matters which the hardwood trade has had to consider. Louisville is one of the few large cities in this section of the country which is without a central traffic organization, and the lack of such a proposition has been keenly felt. T. Smith Milton of the Churchhill-Milton Lumber Company is one of the most earnest advocates of a traffic bureau, and has proposed that the lumber trade start the proposition and take it up with other business men. He believes that it would be easy to raise \$5,000 a year for the support of the enterprise, inasmuch as the benefits to be derived would be very much in excess of this sum.

Forestry matters have been put prominently before the public of late by reason of the aggressive work which the state forestry department, of which J. E. Barton is head, has done in fighting the fires which have broken out in number in eastern Kentucky. Until the past year or two there was no organized methods of handling the fires and they did great damage, which, however, was never made the subject of statistical study, so that it was impossible to determine just how much the state was losing. His records for the first eleven months of 1914 show that there have been 101 fires, costing the state \$100,000. Inasmuch as the loss heretofore has been much greater, on account of the absence of organized opposition to the fires, it is evident that the state has been suffering a great loss every year through the destruction of timber.

On account of the persistent fight which it has had to make against the Louisville & Nashville Railroad to secure what it regarded as tolerable conditions, the Ohio Valley Tle Company of Louisville was generally congratulated on its success in its damage suit against the railroad, the court of appeals having handed down a decision affirming a judgment in favor of the company for \$56,871. The tie concern alleged that the railroad was trying to put it out of business, so that it would have no competition in the purchase of ties along its lines, and that it raised rates, refused to furnish cars, refused to deliver cars to customers of the tie concern and in other ways made carrying on its business a losing proposition. The tie company, of which C. P. Bush is president, has won cases before the State Railroad Commission, the Interstate Commerce Commission and the civil courts, all requiring the Louisville & Nashville to charge only the lumber rate for carrying ties, and to furnish adequate accommodations.

One of the most interesting social events of the year was the wedding of Miss Elizabeth Durrett Jenkins and Mr. Samuel Castleman Mengel, which took place November 25 at the Fourth Avenue Methodist church. After the wedding the couple left for North Carolina, and on their return they will be at home with Mr. Mengel's parents, Mr. and Mrs. Clarence R. Mengel. Col. Mengel is president of the C. C. Mengel & Bro. Company, and Samuel Mengel is connected with the concern.

The Mutual Wheel Company of Paducah, Ky., has filed a complaint with the Interstate Commerce Commission against the Nashville, Chattanooga & St. Louis and the Illinois Central, alleging that switching charges which are imposed in transferring logs from its river landing to its plant are exorbitant. The total charge which the company is paying is \$7 a car. The company asks for reparation as well as an adjustment of the charges.

W. P. Brown, the retired head of the W. P. Brown & Sons Lumber Company, was in Louisville Thanksgiving and ate turkey with his sons, Mart and Graham Brown, at their apartment in the Weissinger-Gaultbert. The other members of the family were also present, and the event was a very delightful party. Mr. Brown is not entirely well, but enjoyed the trip to Louisville very much.

—< ST. LOUIS >—

November receipts of lumber by rail into St. Louis, as reported by the Merchants' Exchange, totaled 14,503 cars. In November, 1913, the receipts totaled 14,132 cars, showing an increase during November this year of 371 cars. Shipments of lumber by rail in November, 1914, were 9,702 cars. In November, 1913, shipments were 11,998 cars, a falling off this November of 2,296 cars.

In a letter sent out last month by Charles E. Thomas, chairman of the traffic committee of the Lumbermen's Exchange, some very important information was given to hardwood lumbermen. In the letter it was stated that the Public Service Commission had been asked by the Missouri railroads for a hearing in regard to permission to advance their schedules of state rates, and the Public Service Commission set December first on which the hearing was to be held.

The hearing was held as per schedule and quite a few local hardwood

lumbermen were in attendance. Among them was Mr. Kaufmann, traffic manager of the Thomas & Proetz Lumber Company of St. Louis. The hearing was still in progress in Jefferson City at the time this letter was closed.

Word has been received here that there will be a hearing on the I. & S. Docket No. 529, on rates on lumber from southern points to the Ohio river crossings and other points, by the Interstate Commerce Commission at Birmingham, Ala., on December 18, at Memphis, Tenn., December 13, and another at Louisville, Ky., on December 19.

The two nominating committees of the Lumbermen's Club, the one appointed by the chair, composed of C. W. Jurden, P. F. Cook and W. J. Yardley, and the one named from the floor consisting of R. J. Fine, Thomas C. Whitmarsh and R. J. Price, who were to select names for officers to be voted on at the regular yearly election to be held December 15, have made their reports. Each committee met separately and then met together. They have made up the same slate, so there will be no competition at the election. For president, W. E. Barns of the St. Louis Lumberman; first vice-president, C. A. Antrim of the Antrim Lumber Company; second vice-president, F. J. Rieffling, secretary of the Geo. W. Miles Timber & Lumber Company; treasurer, C. P. Jennings of the Berthold & Jennings Lumber Company; secretary, O. A. Pier, and statistician, W. F. Biederman.

The meeting at which the election will be held will probably take place at the Planters' hotel on the date already mentioned.

← LITTLE ROCK →

The Fee-Crayton Lumber Company of Dermott, Ark., has reopened its plant at Dermott. This company is engaged in the manufacture of hardwood lumber, and was closed immediately after the breaking of hostilities in Europe. The output of the concern now is being sold to American trade.

The large handle factory at Fisher, in Poinsett county, Ark., was recently destroyed by fire.

Litigation over the Virgin Timber Company's holdings at Pine Bluff and Clio, which began more than a year ago, has terminated, and A. B. Newman of Chicago now holds a deed to the property, valued at \$450,000. The old Virgin Timber Company has surrendered its charter to the secretary of state, but Mr. Newman has been in Arkansas recently looking over the property, and it is thought that he will arrange to start the plants within the next year.

Hundreds of fine specimens are being gathered and prepared for shipment to the Panama Pacific Exposition from Arkansas, among them being some that are declared by the experts in charge of the packing to be of unusual interest. These exhibits will be placed by the commission in charge in the Arkansas building, which is now about two-thirds finished. The commissioners declare that the building and all exhibits will be finished and in place by the time of the formal opening of the World's Fair. The Arkansas building will be unique in that it will be finished exclusively of Arkansas, native woods. Each of the sixteen rooms of the building will be finished in different kinds of wood, among which oak, gum and other hardwoods will play an important part.

← WISCONSIN →

The National Toy Manufacturing Company has been incorporated in Milwaukee with a capital stock of \$10,000 by A. L. Hentzen, A. C. Dick and A. L. Kleinboehl. Mr. Kleinboehl, who will head the new concern, says that he hopes to have the plant in operation by the opening of the new year. Only wooden toys will be turned out. Adolph Boehner, a toy-maker, formerly of Germany, will be factory superintendent.

Miles H. Wheeler, a pioneer lumberman of Neenah, Wis., died on November 27 of heart trouble. He was seventy-six years old. Mr. Wheeler had amassed a considerable fortune in the lumber business. He is survived by two daughters and one son.

Benjamin S. Nuzum has resigned as manager for the Nuzum-Hunter Lumber Company at Readstown, Wis., and has joined the traveling sales force of the Goodyear Lumber Company of Tomah, Wis.

The Winter Lumber Company, Sheboygan, Wis., well-known manufacturer of fixtures, has moved its offices from its North Eighth street building to its factory proper. The former office structure will be used by the sales and display departments.

The J. S. Stearns Lumber Company has closed its sawmills at Washburn and at Odanah, Wis. The plant at Odanah is now being overhauled and will be placed in operation again soon. The company is operating three camps at the present time and expects to open more by the first of the year.

The Moore & Galloway Lumber Company of Fond du Lac, Wis., has opened a new camp at Galloway, which was dedicated recently at a banquet and dance. The company maintains five camps at Galloway.

The Stevens Lumber Company of Rhinelander, Wis., recently closed its sawmill after making what it believes to be its record cut, consisting of 17,500,000 feet. The plant will be placed in operation again about February 1.

The Wisconsin Seating Company of New London, Wis., is completing the erection of a new three-story building, which will be ready for occupancy soon after the first of the year. The company's offices will be located on second floor.

The Scott & Howe sawmill at Hurley, Wis., has been closed down for repairs, after a steady run of nearly a year. Operations will be resumed

at the plant in about a month. The company's planing mill is operating full time.

The sawmill and cheese box factory of the Creamery Package Manufacturing Company at Butternut, Wis., have been purchased by Howland & Waltz of Butternut and Minneapolis. Business men of Butternut are encouraging the purchasers to open a woodworking plant.

A. L. Osborn of the Scott & Howe Lumber Company of Oshkosh, Wis., was elected a director of the Wisconsin Manufacturers' Association at the annual meeting held in Milwaukee recently. Many Wisconsin lumber concerns are affiliated with the organization.

< DETROIT >

W. J. and R. E. Chesbrough have bought the sawmill property of the Athens Hardwood Company at Athens, Mich., and will remove it to tracts of timber near Trout Lake, where they will operate under the name of the Willwin Lumber Company. They own about 100,000,000 feet of hardwood near Trout Lake.

Henry Stephens of Waters, prominent Michigan lumberman, is a candidate for regent of the University of Michigan. He is a graduate of the Universities of Michigan and Harvard and a post-graduate of the Universities of Heidelberg and Vienna. One of his hobbies is clean athletics.

The I. Stephenson Company's flooring mills at Wells will suspend operations within a short time. The company has a large stock of flooring on hand and reports the demand light. The company's big sawmill at Wells has been closed for some time and there is little or no prospect of a resumption of operations before spring.

The stockholders of the Ross Cabinet Company of Otsego, Mich., have appointed a committee to solicit financial support from the citizens of Otsego. If it is not forthcoming, directors say, the company will have to close its plant or remove to a place where support will be given. The company has been employing forty men and has plenty of orders to keep the plant busy, but the capital necessary for operation is lacking.

The Scott & Howe Lumber Company's sawmill at Ironwood has resumed operations on a single shift after a shutdown of several weeks for repairs. A night shift will be added later.

Herman and William Holmes of Crystal Falls are doing considerable logging on a large tract of timber recently acquired near Michigamme.

John C. Scott, Vanderbilt lumberman, has presented the state of Michigan with a bill for \$2,500, representing damages to his timberlands by hunters licensed by the state. He has taken the stand that the state has no power to license hunters to hunt on lands other than those owned by the state.

The Baraga Lumber Company has finished the season's cut at its sawmill at Baraga. More than 9,000,000 feet of lumber were manufactured this season. The run was started early in the spring and has been continuous. President Hillyer of the Baraga company announces the company will cut 6,000,000 feet of logs at two camps near Point Abbaye this winter.

D. N. McLeod, Garnet lumberman, announces that he will operate in the woods this winter as extensively as in other seasons. He believes business conditions will improve greatly in the next few months. Labor is plentiful this season, which fact will enable cheaper operations in the woods.

In recent shipments the North American Construction Company at Bay City has received 528,474 feet of lumber on the steamer Prentice and 505,000 feet on the barge F. M. Knapp, both loaded at Hancock. The Bradley-Miller Company, also of Bay City, has received considerable lumber from Ontario ports.

Following the installation of a dry kiln the Dunham stove mill at Leota, Mich., has resumed operations.

The Hemily Lumber Company is building an addition to its planing mill at White Cloud, Mich.

The Besinger & Brandel sawmill and handle factory at Shiawassee has resumed operations.

W. L. Babitt has purchased the retail lumber business of W. F. Phillips at Niles, Mich.

Through the efforts of the Business Men's Association of Ontonagon the Greenwood Lumber Company will continue to operate its sawmill at that place. The mill has been idle, and it is now expected that operations will be resumed within a short time.

W. B. Ewing of Chelsea is removing the Geesey sawmill, a landmark at Dowagiac, Mich., to Wayne county, where he has purchased a tract of timber containing about 75,000 feet of oak and 225,000 feet of other timber, mostly hardwood.

Edwin T. Corwin and C. D. Riley of Ontonagon have formed a partnership and will cut about 1,000,000 feet of hardwood near Norwich Road. Camps are now being established.

The Hardwood Market

< CHICAGO >

There is not very much more lumber moving now than for several weeks past, nor is there a very strong likelihood that there will be a marked increase in actual shipments to local factories. However, there is unanimous optimism based on a distinctly more favorable tone among the buy-

ers' statements of prospects. Quite a little lumber has been placed locally during the last couple of weeks, and it is gratifying to note that several companies have landed business with some of the railroads.

Local concerns in common with others are endeavoring to contract for stocks for 1915, which is a reasonably sure evidence that they anticipate much stronger prices after the first of the year. Of course the inventory season is holding up the placing of orders for the most part and will continue to do so to a very considerable extent.

The building situation is not especially gratifying, but with the easing of the money market there is much more interest in building investment than there has been, this being in common with improvement in financial investment in many other lines.

Already there are a few orders being placed at more favorable prices. Although this condition is not at all general. However, on the whole the local trade is rather pleased with the situation, especially with the prospects for 1915.

< NEW YORK >

There has been nothing more startling than a further reduction in price on some hardwood items to feature the local market since last writing. There had been a deal of optimistic talk and even some cases of increased demand and every one was making the statement that prices had reached rock bottom and due to advance. But now we find that some dealers continue to use the knife and have evidently forgotten the element of profit in the conduct of their business. Plain oak has come in for the greatest cut, some recent quotations being \$2 and \$3 below those of two weeks ago. Maple and beech have also shown some reductions. Current demand is unsteady and there appears to be no difficulty in securing all the stock called for by present needs. The immediate outlook is not for any great amount of buying, though many are freely predicting a return to prosperity with early spring.

< BUFFALO >

New business is slow to develop at the hardwood yards, and aside from occasional special orders there is not much change from the dullness of a month ago. Some wholesalers say their trade is less active than a month ago and it is the exception to find a yard that has any greater amount of business than several weeks ago. General improvement is expected to start a little after the new year.

No improvement has occurred in the building situation, and the banks are still loaning money under restrictions. As soon as this policy is changed, it is likely that Buffalo will have a good run of building work, as everybody in the real estate business seems to think that it is only a matter of a short time before construction work starts up actively. Large projects are being kept in abeyance and the total permits show a less cost than usual for this city.

Oak and maple are the chief woods in demand and prices are somewhat depressed, owing to competition, but not much decline has lately occurred. Thick stock is particularly wanted. Poplar has not shown up well lately in amount of sales. Quartered oak is one of the firmest woods in the market, though it is not selling actively at present. A pretty fair demand exists for cypress for finish and for tank building.

< PHILADELPHIA >

Although there has been no significant change in the hardwood trading from a fortnight ago, a strongly rooted optimism prevails as to the outlook for a magnified advance at the opening of the new year. Inquiries have been somewhat more liberal resulting in a considerable number of desirable orders for immediate shipment. In some cases fair prices have been obtained, but on the whole a restrained buying is noticeable in spite of tempting offers. Mill stocks are gradually growing smaller and a stiffening in some lines is reported, but such is not the case in the consuming market. Building work, although still below last year's figures, has been of sufficient volume to keep up a fair activity in building lumber and the supply industries. Box makers hold fairly busy and now that numerous factories manufacturing textile goods, shoes and many other products for the foreign market are booking larger orders, the box men are beginning to see the silver lining to the dark cloud.

In the hardwood market prices on the whole have been fairly steady; plain and quartered oak are leaders, with a fairly strong stand in values. Most of the other woods in the better grades have shown no inclination to move up. In the low grades, with the exception of those used in the furniture trade, there has been a fair volume of trading and reasonably fair prices. Owing to the depressed condition of trade an overplus accumulation of stock in manufactured goods is noticeable in the furniture factories. Investigation among the large department stores has shown that the month of October, which is signalized for its enormous volume of sales in large furniture, has fallen considerably behind the usual month's total of sales, which has been a severe blow to the manufacturers.

Although the money market is making matters a little easier, there is still a large number of buyers who are obliged to ask assistance from their creditors to carry them along until after the first of the year. But notwithstanding these various impediments an unquenchable optimism obtains, which tends to sustain the business man through what he considers an ever lessening gap between bad and good business.

← PITTSBURGH →

Wholesalers here report a little better outlook in the hardwood situation. A few inquiries are coming in now from railroads. Manufacturers seem to show a little spirit in buying, although their purchases are very small. Yard trade is confined to immediate needs. There is a chance that the coal business will be quite a little better soon as higher water will enable the coal companies to send the biggest fleet South next week that has probably ever left Pittsburgh. Prices on all hardwoods are badly broken and some mills have shut down either for this reason or on account of no water to run.

← BOSTON →

The situation in this market at present may be termed relatively satisfactory. The demand is light, but there is a very moderate call for most items on the list. The unusually large number of mail offers has served to reduce buying as the purchasers assume that the conditions are wholly in favor of taking in the least possible amount. The change from the plan of contracting ahead and cutting to order has been towards buying at the last minute. Such a situation, especially after a season of greatly curtailed production, is expected to result in increased business later on, probably in the late winter or spring. General business conditions here are reported by good authorities to be considerably better, building projects showing some increase, failures (especially in the lumber trade) have decreased, and money for sound purposes is fairly plentiful. The local hardwood dealers are inclined to await improved business and a consequent demand at normal prices. Most of the insistent efforts to push off stock at this time are made by shippers in the producing sections. In this process of trying to get the consuming factories to take piled up stock off their hands, one inducement has called for another, and the result is that values are disturbed. A good many sales are no doubt made for less than the stock is worth, and the range between the reported low prices and the quotations of good mills is so great as to cause confusion and extreme caution by purchasers.

← BALTIMORE →

The hardwood men are still waiting for the situation to clarify. They have nothing to report which could be regarded as modifying the character of the trade. It is felt that until after the first of the year the buyers must be expected to hold off with the placing of orders, and that a general tendency will prevail to hold back as much as possible. Meanwhile, the range of prices in the domestic trade has not become more definite. While it does not appear that good marketable stocks are unduly plentiful, or that anything like congestion prevails, still, the prolonging of the period of inactivity has rather tended to increase the desire to take orders, and this has been against a steadying of the market. Some of the woods, or certain grades, are stated to be rather weak, among them being the better quality of poplar, and sound wormy chestnut. On the other hand, it is stated—and these reports have gained in definiteness of late—that a better feeling has begun to manifest itself, and not a few of the hardwood men are willing to hazard fairly specific predictions that a marked improvement may be looked for after the first of the year. They point to the growing disposition of the foreign buyers to place orders, usually at an advance. Unless present indications should prove altogether misleading there is a fair prospect that the export business will pick up, which hope, if realized, would make the sellers in the domestic markets take courage. For the present, the demand from furniture manufacturers, for a time rather active, has settled down to very moderate proportions, and little is expected from this source until after the first of the year. In fact, the hardwood trade is preparing to settle down to a season of even more pronounced quiet than has prevailed since the war, and accept it as one of the things always to be looked for at this season. If it is rather more emphasized than usual, the extraordinary conditions that prevail must not be lost sight of. Over and above all this, however, is the growing belief that the lowest point has been touched and that the trend of developments with the new year will be upward.

← COLUMBUS →

The hardwood trade in Columbus and central Ohio has ruled fairly steady during the past fortnight. Demand is as good as could be expected under the circumstances, and prospects for the future are not so bad as formerly. On the whole the tone is fair and lumbermen generally believe a better trade will take place after the first of the year.

One of the best features of the trade is the better buying on the part of manufacturing establishments. This is especially true of factories making furniture and vehicles. Implement factories are also buying better. Manufacturing on the whole appears to be recovering from the depression and looking for a better run of business.

In the retail line buying is being done by dealers whose stocks are low. They are not increasing them but are compelled to buy from time to time. The pleasant weather has enabled building operations to proceed later than usual and that has had a good effect on the hardwood trade. On the whole the retail business is in fair shape.

Shipments are coming out promptly and dry stocks in the hands of shippers are not very large. Prices are fairly well maintained at the levels which have prevailed for some time. Some cutting is being done

to move stocks where they have accumulated. One of the worst features of the trade is poor collections.

Plain and quarter sawed oak is in fair demand, with prices well maintained. There is a good movement of chestnut, especially the lower grades. Poplar is in good demand and the same is true of ash and basswood. Automobile factories are buying wide sizes of poplar. Other hardwoods are unchanged.

< TOLEDO >

The hardwood situation, like the general lumber market here, is showing considerable improvement. There has been a pessimistic feeling which could not be controlled, permeating the various lumber offices in Toledo ever since the war broke out until about a week or two ago when the clouds begun to break. Conditions since then have showed marked improvement. Buying has been confined for some time past to actual needs. The call for immediate use, however, has been satisfactory, resulting in enough business to keep things running. There has also been some speculative buying, although this is confined to special bargains. Poplar and cypress have been in good demand here and bringing fair prices. The factory demand for hardwoods is better than for some time past. It is also stated that railroads are placing more orders for equipment than for months past, which is always hailed as a big indicator by local hardwood dealers. Taken altogether there is considerable satisfaction felt by local hardwood dealers, and wholesalers are almost a unit in the belief that prices will be up following the inventories the first of the year.

< INDIANAPOLIS >

There has been an increase in the number of inquiries received by hardwood manufacturers and wholesalers during the last two weeks. There has also been a slight increase in sales, but the present volume of business continues unsatisfactory. The outlook for the future, however, is much brighter than it has been.

Retail dealers have greatly depleted stocks, as they have bought from hand to mouth for several months. Some of them are now getting in the notion of stocking up on a conservative basis, in order to take advantage of present prices.

It is thought that the vast orders placed with Indiana manufacturers for war equipment will soon reflect in an increased demand for hardwoods. In fact, plentiful results already obtain in some parts of the state, particularly in northern Indiana.

Building operations are being resumed, because of a slight betterment in the financial situation, which has made some money available for loans for building purposes.

< NASHVILLE >

No material change is reported in the local hardwood lumber situation. There is a pronounced policy of curtailment of output that is being felt more as the time goes on. Many of the big plants are endeavoring to run part time in order to keep their organizations intact, while a number of plants, particularly the small ones, have ceased operations. Some small export shipments are being made to England, and some business is being handled all along, but no big business. There is little change in values, dealers not seeing any advantage in reducing prices, as such a course does not increase consumption.

< BRISTOL >

The lumber business in this section continues very dull, but there is a growing belief among the hardwood men that trade will pick up materially with the passing of the present year and that the early spring will see the best market in a long while. A very small volume of business is being done at this time and few of the mills are in operation, most of them having closed down in September and October, with the intention of remaining closed until the early spring, unless conditions should sooner justify resumption. The situation is characterized here by a spirit of optimism among the lumbermen generally.

< ST. LOUIS >

The call for hardwood during the past couple of weeks has been fairly steady but the orders have been for small quantities. The majority of the local distributors do not anticipate any betterment in trade until the period of inventory is over. Then they are looking for a good, lively demand from the many yards and consumers which have been allowing their stocks to run down to a very low point. This promise of a resumption of trade is steadying prices. There will be a still further strengthening in prices as the new year draws near. There is a fairly good cypress trade, especially where mixed cars of stock are concerned. The orders are not for stocking up purposes, however, but only for immediate use. Steady prices are being maintained. A better demand is anticipated shortly, especially from country yards in the East and Southeast.

< LOUISVILLE >

December is usually a light month in the hardwood trade, and local lumbermen expect this to prove no exception to the rule. The habit of postponing purchases until after the first of the year is still strong with

KANSAS CITY

the average consumer, and the chances are that business will not be really brisk until 1915 has been ushered in. However, there is no denying that prospects are splendid, and that unless every indication is wrong hardwood men will experience a satisfactory demand in the near future. General business is improving. The millions being spent for war munitions are helping a good many lines, and indirectly lumber consumption. Some lumber trade is growing out of the war. On the other hand, railroad buying is somewhat more active; the furniture trade is looking better, though the January exhibitions will determine this more definitely, and prospects for building in 1915, provided financial conditions are favorable to investment, are much better than they have been. Many inquiries for large blocks of stock to be delivered after the first of the year have been received, indicating that big handlers are expecting to be able to place some large orders. Altogether, the hardwood men are feeling rather confident that the turn in the road is not far ahead.

< MILWAUKEE >

One of the reasons for the quiet lumber trade experienced in Milwaukee during the past month is found in the building summary for November, which shows that the building investment for the month fell off about sixty per cent. There were 236 permits issued for structures to cost only \$591,583, as against 273 permits and an investment of \$1,454,410 during the corresponding period a year ago. Indications are that there ought to be much activity next spring, as much important building planned this fall has been carried over until spring, when it is expected that general business conditions will be more satisfactory.

Wholesalers and dealers seem to be confident that the lumber trade will revive after the opening of the new year when inventories have been completed and most concerns find how light their stocks are. Better buying is bound to result if there is to be any preparation for the coming spring trade. Stocks in the hands of the sash and door and most wood-working concerns of Milwaukee are exceedingly light, as these firms have been buying carefully all the fall, taking only enough to meet their present requirements. Wholesalers say that stocks in most retail yards are light and that the average dealer will soon have to begin stocking up in readiness for the spring building demand.

Local furniture manufacturing concerns and the farm implement plants in Milwaukee and about Wisconsin have been making better inquiries and placing larger orders of late, proof that they are experiencing a better business and that they have confidence of better things ahead. Stocks in the hands of all these concerns have been light all the fall.

Wholesalers are inclined to keep prices at the present level, despite the easier demand. They say that the light stocks, especially in northern hardwoods, and the improved demand which is sure to develop soon offer reason enough why present values should be maintained. There are, of course, instances of price cutting, but the practice is not general.

< DETROIT >

The winter furniture show at Grand Rapids and inventory period are now awaited by hardwood dealers, who anticipate that change in the hardwood market will follow these events. It is certain that inventories will show an unusually low stock at all plants. The outcome of the furniture show is in much doubt, but any effect that it has, probably will be for the better. Detroit hardwood dealers do not anticipate a further decline in trade. In fact, they do not see where the demand can fall further without ceasing altogether.

Among the wholesalers birch and walnut probably show the greatest activity. The demand in maple is very slight and stocks that have been standing for sometime show no inclination to move. Interior finish manufacturers do not hold out a hope that building operations, which have fallen off alarmingly in the last three months, will receive an impetus until after the first of the year.

< LIVERPOOL >

The market here is very much better than has been reported on previous occasions. In fact, with the exception of one or two departments trade is decidedly brisk. A reference in this paper by the writer of this article has been commented on with some needless sarcasm by the *Timber Trades Journal* of London. The point referred to was the demand for over 2,000,000 staves. It may surprise this clever paper that orders for more than this quantity have actually been placed with American shippers to personal knowledge of *Hardwood Record's* correspondent, and those shippers who took advantage of his advice will be congratulating themselves. It may be said that all orders for this stock have been placed for the present, though it is possible further orders may follow later. Values have not advanced to any material extent in any line of hardwoods at this port, even in spite of freight advancements.

Some thicknesses of ash planks, mainly 3" and 4", have sold well, but offers on old basis only could be secured. Cypress has been selling well and shippers with this stock should have no difficulty in selling, though ideas of value here are low. Round American ash is a good point and very little stock is on hand though it is understood some new arrivals are on the way. These should come to a good market. All cabinet woods are still weak and mahogany, of course, comes under this category. There have been no sales since the war started.

YOU SHOULD USE THE GIBSON TALLY BOOK

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—4 1/2 x 8 1/2 inches in size.

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket.

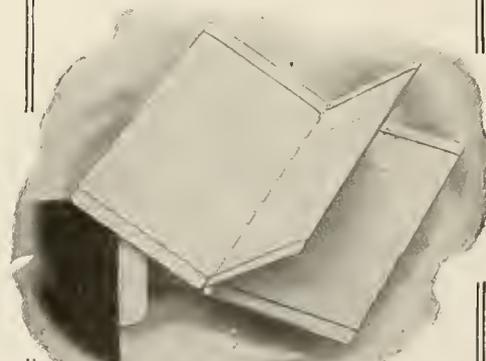

Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired.

Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs, Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability, convenience, accuracy, and for systematizing the inspection and measurement of lumber.

Patent applied for on covers. Copyrighted, 1910, Triplicate Tally Tickets patented.

PRICE LIST

Aluminum Tally Covers, each	\$ 1.00
Aluminum Tally Covers, per dozen	10.00
Patented triplicate Tally Tickets (stock form)	per 1,000 10.00
Single sheet manila (stock form) Tally Tickets,	per 1,000 4.00

Specimen forms of Tally Tickets mailed on application. Covers sold on approval to responsible concerns.

EASY TO INSTALL

CHICAGO, July 13, 1914.

The National Dry Kiln Co.,
Indianapolis, Ind.

Gentlemen:

We are very glad to advise you that our kiln, which is installed with VERTICAL PIPING system furnished by you, has now been in operation about six months and results are all that we could desire. We wish to state that this material was received in condition which enabled us to install it from the blue print without any difficulty on our part.

We will be very glad to have you use our company as a reference at any time.

Very truly yours,
ROSELAND MILL & LUMBER CO.,

Perkins Glue Fast Becoming the Standard For All Veneer Work

Manufacturers who use glue for veneer laying and built-up panel work are rapidly realizing the advantages of a glue that does away with the hot, bad-smelling glue room necessary with hide glue and are adopting the modern and efficient

Perkins Vegetable Veneer Glue

because it does away with the cooking process, being applied cold. It is equally as efficient as hide glue and at a saving of no less than 20 per cent over hide glue costs. It gives off no bad odor and may be left open a number of days without souring or in any way affecting its adhesive qualities.

Every shipment is absolutely uniform.
The use of Perkins Glue does away

with blistered work and is affected in no way by climatic changes, thus increasing the advantages of manufacturers, who must ship their goods to hot, cold or damp climates.

Unsolicited testimonials from hundreds in all glue using lines praise its efficiency and economical application.

Write us today for detailed information.

EXPERIENCED LOGGERS USE YELLOW STRAND POWERSTEEL

In every hardwood lumber district in the United States—wherever ropes of extra strength and durability are required—there you will find Yellow Strand Powersteel Wire Rope.

It is made especially to withstand the tremendous strains of logging and heavy hoisting of all kinds.

Every wire is drawn from a special steel having a tensile strength 75 to 100 per cent greater than ordinary crucible steel. This insures great strength, elasticity and long life to the rope.

You need this strong, tough, pliable rope in your business. Why not place the order now?

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

ST. FRANCIS BASIN OAK

THE GALLOWAY-PEASE KIND

It is a peculiarity of our timber that, growing beyond the over-flow district, it matures slowly—hence has even texture and is soft and light with uniform color.

¶ Kiln dries without checking. No honey-combing, and minimum shrinkage.

¶ Total absence of injurious insects insures sturdy, clean growth.

¶ Our band mills cut oak only—hence filer and sawyer get best possible results.

SAVE YOUR MONEY BY USING THE

RED BOOK

Published Semi-annually
in February and August

It contains a carefully prepared list of the buyers of lumber in car lots, both among the dealers and manufacturers.

The book indicates their financial standing and manner of meeting obligations. Covers the United States, Alberta, Manitoba and Saskatchewan. The trade recognizes this book as the authority on the line it covers.

A well organized Collection Department is also operated and the same is open to you. Write for terms.

Lumbermen's Credit Assn.,

Established 1878

608 So. Dearborn St. CHICAGO
Mention This Paper 55 John St. NEW YORK CITY

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

Hardwood Record's

strongest circulation is in the region where things are made of wood—WISCONSIN, MICHIGAN, ILLINOIS, INDIANA, OHIO, PENNSYLVANIA, NEW YORK and the East. **It's the BEST sales medium for hardwood lumber.**

NASHVILLE

THE LOGICAL PLACE TO BUY HARDWOODS

THE following is a list of stocks offered to the consuming trade by the hardwood lumbermen of Nashville. The character of the timber from which Nashville hardwood men secure their stocks places them in a peculiarly strong position as far as quality of lumber is concerned. Nashville lumbermen have always been noted for their strict adherence to all terms of sale, and in short have an enviable reputation for making good both as to the quality of lumber and as to grading.

The members of the Nashville hardwood trade solicit your attention to these facts and an opportunity of demonstrating their truthfulness.

American Black Walnut The Popular Favorite

¶ The contention of those who knew, that once the public were given a chance to express its approval, American Black Walnut would promptly return to popular favor, is being borne out by the event. Walnut is taking—has already taken! At the January furniture shows there will be sixty-six exhibits containing numbers made of this wonderful wood. Factory men who have not arranged to use it are overlooking the "one best bet" for 1913. Don't be the last to climb into the bandwagon!

Band Sawn Hardwoods

WE PRODUCE OUR OWN STOCKS

Our Specialties: Cottonwood, Red and Sap Gum, Oak—plain and quartered, red and white, Three Ply Red Gum Panels.

A Few Items We Want to Move:

- 10 Cars 4/4"x 6" to 12" 1st & 2nds Cottonwood.
- 8 Cars 4/4"x13" to 17" 1st & 2nds Cottonwood.
- 6 Cars 4/4"x18" to 22" 1st & 2nds Cottonwood.
- 10 Cars 4/4"x13" to 17" Cottonwood Box Boards.
- 5 Cars 4/4"x 9" to 12" Cottonwood Box Boards.
- 5 Cars 5/4"x 6" to 12" 1st & 2nds Cottonwood.
- 3 Cars 6/4"x 6" & wider 1st & 2nds Cottonwood.
- 3 Cars 8/4"x 6" & wider 1st & 2nds Cottonwood.
- 2 Cars 3/8"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 1/2"x 6" & wider 1st & 2nds Plain White Oak.
- 3 Cars 5/8"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 3/4"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 4/4"x 6" & wider 1st & 2nds Plain White Oak.
- 2 Cars 5/4" Log Run Soft Maple.
- 5 Cars 12/4" Log Run Soft Maple.
- 2 Cars 3/8"x 6" & wider 1st & 2nds Red Gum.
- 2 Cars 1/2"x 6" & wider 1st & 2nds Red Gum.
- 3 Cars 5/8"x 6" & wider 1st & 2nds Red Gum.
- 2 Cars 3/4"x 6" & wider 1st & 2nds Red Gum.
- 7 Cars 4/4"x 6" & wider 1st & 2nds Red Gum.
- 2 Cars 5/4"x 6" & wider 1st & 2nds Red Gum.
- 1 Car 6/4"x 6" & wider 1st & 2nds Red Gum.
- 1 Car 8/4"x 6" & wider 1st & 2nds Red Gum.
- 1 Car 3/8"x 4" & wider No. 1 Com. Red Gum.
- 1 Car 5/8"x 4" & wider No. 1 Com. Red Gum.
- 1 Car 3/4"x 4" & wider No. 1 Com. Red Gum.
- 6 Cars 4/4"x 4" & wider No. 1 Com. Red Gum.
- 2 Cars 5/4"x 4" & wider No. 1 Com. Red Gum.
- 1 Car 6/4"x 4" & wider No. 1 Com. Red Gum.
- 2 Cars 3/8"x 6" & wider 1st & 2nds Sap Gum.
- 3 Cars 3/4"x 6" & wider 1st & 2nds Sap Gum.
- 3 Cars 4/4"x13" & wider No. 1 Com. Sap Gum.
- 6 Cars 5/4" Log Run Plain Sycamore.
- 6 Cars 3/4" 1st & 2nds Plain Red Oak.
- 8 Cars 4/4" 1st & 2nds Plain Red Oak.
- 2 Cars 5/8" 1st & 2nds Plain Red Oak.
- 7 Cars 4/4" 1st & 2nds Plain Red Oak.

Review and Outlook

General Market Conditions

THE MOST SERIOUS CONSIDERATION before the general lumber trade is the effect which drastic increases in ocean freight rates, and lack of desire on the part of ocean carriers for lumber shipment will have on the domestic business. The extremely active call for export of commodities immediately needed by European nations places shipping facilities at a premium, the result being an arbitrary and unreasonable boost in freight rates, the rates in some cases now being seven or eight times what they were six months ago.

It may be that European countries will feel a sufficient need for American stocks to make it worth while to pay the price which will result from this boost in cost of transportation, but this condition has not as yet manifested itself as a fact. In the meantime lumber exporters are beginning to count on an entire shutting off of export trade after the first of the year.

Of course there has really not been enough lumber shipped since the outbreak of the war to make this a really serious consideration, although in the aggregate the total quantity of shipments has been of considerable proportions. However, it is not likely that the situation will have an unduly serious effect on the trade as a whole, but rather will be detrimental to the interests of individual firms, as it will not be likely to turn back enough lumber on the domestic markets to cause any demoralization.

HARDWOOD RECORD understands there is an investigation now under way which has just started at Washington to look into the action of the steamship companies, and whether or not this will have any favorable effect remains to be seen.

In the meantime there can be no question that domestic conditions are decidedly better. The resumption of buying by the railroads, which became effective a few weeks ago, will very likely be further stimulated by favorable action on the part of the Interstate Commerce Commission on the plea of railroad companies for further freight rate increases. It is entirely likely that the railroads are permanently back into the purchasing field, although to just what extent they will open up their purchasing departments it is impossible to say. So far their supplies have been bought mainly for repair work, but it may be that they will begin to make plans for the manufacture of new stocks and equipment.

The perennial check to buying on the part of the factory and yard trades, which usually occurs in the latter part of November or early in December and even earlier, was not manifest this year until about the middle of the month. That is, the condition did not generally affect lumber sales. However, lumber movements are being held up almost entirely right now on account of inventory taking, which condition, however, is not at all disappointing; on the other

hand, lumbermen have felt a degree of satisfaction and encouragement in the fact that a cessation of order placing on account of inventory taking was held up until a later date than usual.

The tone of the evident feeling among all lumber buyers seems to be particularly encouraging for the resumption of order placing immediately following the opening of the new year. There has been a decided inclination not to burden 1914 cash accounts for purchases which are not absolutely necessary. Of course there has been a considerable quantity of lumber going into factories and yards, but in most cases this has only been in strict conformity to immediate and insistent demands from the operating department.

The general tone of reports coming from all over the country has certainly been revolutionized during the past month. Previous to that time there seemed to be no ray of encouragement and deep gloom pervaded the entire trade, especially in the East. However, recent reports even from the conservative eastern states are encouraging in the extreme, although the hope expressed is conservative. No one seems to anticipate or desire immediate resumption on a normal plane, the general hope being that gradual strengthening of business which has been anticipated for so long, will begin to show itself after the new year. That these hopes are based on sound foundations is distinctly proven by conditions which are actually opening up.

The resumption of business in Wall street without undue excitement or undesirable fluctuations is a decidedly portentous omen for good. There is a surprising scarcity of liquidations of foreign holdings, and as a consequence the general tendency toward an easing of the money conditions of the country was not checked by this development in the East. It had been confidently expected that the opening up of the New York Stock Exchange would result in a complication of developments that would have a checking tendency on business throughout the country. However, this development has become a matter of history without the anticipated result.

The whole fabric of the American business seems to be knit with sufficient closeness to withstand the wear and tear incident to present abnormal conditions. It has come through the most serious part of the crisis without undue casualties, and is approaching the new year with confidence entirely justified by conditions and with an unanimous belief in its ability to stand on its own feet squarely, and to make real progress with the opening of the new year.

The opportunity is here to prove American resourcefulness and ability without undue risk. American business men now have the opportunity of proving themselves worthy of the best traditions of American character, or as moral cowards in a business sense. We have the incentive, the energy and the resources to take the former course, and the excuse to follow the latter course. Which road will we follow?

The Cover Picture

THE EVIDENCES OF CHRISTMAS in this issue's cover picture are not so apparent as to cut out all need of the imagination. It is an unusual Christmas scene which has no human being in sight, and no sign of human activities, other than an old, rude road with a wagon track, and without any means of telling whether the wagon was going or coming. The snow on the ground fell some time ago. It does not require much of a woodsman to cipher that out. The snow lies too flat to be newly fallen. Weeds do not rise clean above fresh snow; and another evidence that the snow has been down for some time is apparent in the fact that the trees have none on their small branches, though the upper sides of large limbs bear thin layers, which the wind has not been strong enough to blow off.

A winter forest is usually looked upon as cheerless, monotonous, and uninteresting; but it is so only for those who lack discernment, and who fail to see the interesting phenomena. In some respects an old snow in the woods is more interesting than a new. It loses its pure whiteness, not because the snow itself is any less white, but for the reason that the surface becomes strewn with waste matter from trees and weeds. One is apt to underestimate the amount of such waste until he has noticed it on the snow. The outer layer of bark is constantly disintegrating and falling as fine particles. This bark dust is invisible when it drops on the bare ground or on dead leaves; yet it is considerable. Some trees, like hickory, paper birch, and sycamore, shed their bark in large flakes; but most others get rid of it particle by particle, year in and year out. Every year the tree adds a new bark layer next to the wood, and this compensates for the loss of the outer portion.

Waste comes from buds and fruit, as well as bark, and the snow as it falls catches it. Under birches, sycamores, alders, hemlocks, and several other kinds of trees, so much waste showers down from the outer scales of buds and from cones and other seed cases, that a single day of dry wind through the bare branches often suffices to cover the snow with brown dust and larger particles.

Birds skirmishing among the branches for seeds and buds often facilitate the showers of waste, while mice, issuing from their burrows beneath the snow, eagerly pick up such seeds as birds fail to find.

The dark color of the snow in the cover picture is quite noticeable. The tangle of bare branches overhead accounts for it. It is a safe guess that many a feathered or furred creature is picking a Christmas dinner from the branches above or from the hard surface of the snow beneath, though the camera failed to catch them in the act. It is thus apparent that a merry Christmas is quite possible in deep forests, though no human being is present. About Christmas begins the season when the pheasant haunts the sumac thicket, the snowbird seeks the cones on the alder, the quail, retreating from the snowy grain fields, attacks the birch buds, and various and sundry winged residents make inroads on the hemlock and pine seeds yet remaining in the burrs.

A Portentous Gathering

ON THURSDAY, DECEMBER 17, there met at the Hotel La Salle, Chicago, in the neighborhood of sixty men prominently and actively engaged in lumbering, or connected directly with the lumber business. There were included in this gathering manufac-

turers, association secretaries, yard wholesalers and city and country retailers. The purpose of the meeting was to crystallize the rather scattered and unconcentrated thought of the trade at large upon the question of successfully meeting the issue created by the ever increasing utilization of substitutes for wood.

The proceedings of this meeting are fully recorded in another part of this issue, but HARDWOOD RECORD cannot refrain from stating that this was without doubt one of the most portentous gatherings of men prominently connected with the lumber industry, if not the most portentous, which ever took place.

The meeting had two possibilities. There existed before it took place the possibility that those attending would come with lukewarm feelings on the subject and without a keen appreciation and realization of just what the lumber trade is up against. Had they come in that frame of mind the meeting would unquestionably have resulted in nothing more than has resulted from the many talks and agitations on the same question heretofore. It was fortunate indeed that those attending were representatives of all groups of the

industry affected. It was particularly fortunate that the attendance was not so ponderous that thorough discussion and action could not be taken. As a result of the serious-mindedness of those men who made up the gathering, of the singleness of purpose and determination to actually accomplish something, the prime object was realized. That is, a real, concrete crystallization of ideas and a definite and practical plan for working out the issue was the result of the day's session.

There surely was no man who attended the session, and there probably never was a meeting of lumbermen the proceedings of which were followed with such earnest application, who left without a firm resolve to see the issue through to the end.

Thus this gathering accomplished something which no large gathering of lumbermen could possibly have accomplished. It started a definite issue along definite lines, and it remains now for the trade as a whole and the mass meeting which will take place on February 24-25 at Chicago, to back the effort

of these men who have undertaken the responsibility of putting the third largest industry of the country on a modern, commercial basis and to pledge their support morally and financially without qualification or restriction. That mass meeting should be the objective of every one financially interested in or dependent upon the lumber industry in its many branches. This movement has been launched along simple lines which, with the co-operation of the trade at large, will work out to the satisfaction of everybody. It is up to the trade now to get into their heads that this is a real issue and must be met, and that it is the opportunity and the one opportunity of meeting it squarely and effectively.

A Practical Way of Differentiating Between Red and White Oak

A GREAT DEAL HAS BEEN WRITTEN regarding the differences between oaks coming respectively in the red and white oak groups, and in fact this has always been a question open to a great deal of discussion both among practical men and among technically trained foresters. Of course, the average lumberman who handles hardwoods is competent to tell the difference between ordinary red oak and ordinary white oak, but there are certain species which are

A SHORT CHRISTMAS SERMON

The preachers of good will as a Christmas motto do not preach the whole truth, though an essential part of it.

Good will alone is passive; it accomplishes no results unless backed by something more positive and aggressive.

Good will simply opens the way for good work, and it is the good work that counts in human affairs.

Spiritual advice may appeal to disembodied spirits; but so long as body and spirit are united on this earthly sphere, the best advice is that which appeals to humanity rather than to angels.

The man who does something good is better than the man who contents himself with saying something good.

The man who cases his conscience by feeling for the hungry in the bottom of his heart, is not so good as the man who feels in his pocket.

Christmas should not be made the annual clearing house for the conscience, where a moment of charity is expected to atone for a year of neglect.

Good intentions are like good money; they must be put in circulation before they amount to anything worth while.

Some very pious Christians forget that there are emergencies which call for cash rather than for prayer.

A load of coal for a freezing family in zero weather is worth more in that particular case than all the preach and sermons Adam.

merchantable under each of these headings which come so close to the line of demarcation that it is difficult without some means of positive identification to know in which class they should be put.

So-called scientific methods of identification have been worked out by wood technologists, but in the main these have been of no particular value to the man handling woods as a business.

Samuel J. Record, professor in Yale Forestry School, has made a thorough study of this question, and after repeated and rigid tests announces a means of simple but absolutely reliable identification which can be easily followed by the most humble inspector without any other equipment than a sharp jack-knife and a small hand lens. This lens can be secured at any optical store for from fifty cents to \$1.50. It is necessary that the knife be sharp in order that in cutting off a thin slice of wood at the end of the board the fibres and pores are not unduly nicked.

The test consists in cutting off a portion of the rough surface at the end of the wood, which need not be more than half an inch square, preferably choosing a section which shows a ring of growth of considerable width. Any lumberman can distinguish between the springwood and the summerwood in the oak. It is readily distinguished with the naked eye. Looking at this section then it can be seen that there are light colored patches or lines running somewhat irregularly across it, some appearing like tiny flames. It is these lines which should be closely examined with the magnifier. Examine closely the pores in the summerwood, not the large pores in the springwood. If these summerwood pores are distinct and if you can see into them readily and can count them readily, you are looking at a piece of wood from one of the red or black oaks. If, on the other hand, the small pores are indistinct, if you cannot see into them and if there are so many that it is impossible to count them, then if the cut is a smooth one it is a piece of white oak.

Surely this is a simple and logical enough test to meet the requirements of any man. The beauty of it is that it has been thoroughly tested out and verified by more complicated and severe methods which go into the more scientific end of wood identification.

HARDWOOD RECORD has published more complete description of the whole question on another page of this issue, which should prove interesting reading to any one who is particularly interested in the question of wood identification.

A Lesson from the Edison Fire

IT WOULD BE FOOLISH TO SAY the tremendous conflagration which wiped out the Edison plant at West Orange, N. J., would not have occurred if the buildings had been of mill construction. The highly inflammable character of the contents of all the buildings simply nullified the effect of whatever rightful claims the designers of concrete construction had as to their fireproof qualities. This fire should not be taken as a proof that wood is better than concrete for fireproofing, as to the man who is capable of any intelligent thought such claims in this particular case would be too ridiculous to be worthy of consideration.

On the other hand, it is conclusive proof that the concrete advocates are claiming far too much for their materials as a fire preventor. Edison himself has been one of the most ardent boosters for concrete construction and the complete destruction of his model plant must be a severe blow not only to his finances, but to his pride.

No matter what type of construction is used, whether it is some form of material new in use or some invention that will be developed in the future, the fire hazard will always be with us. Statistics have shown without room for controversy that this hazard is more dependent upon the human element by far than it is upon the type of construction. There are few manufacturing institutions which do not carry in their plants highly inflammable materials which if fully ignited will overcome the most stubborn resistance of any retardent material. It is simply a question of proper regulation and care to prevent any incipient flame which might if uncontrolled lead to total destruction.

The concrete people have waged an excellent fight and have succeeded remarkably in establishing a broad field for their products. Lumbermen have in the past, and before this invasion of wood substitutes became an established fact, gone upon the assumption that

wood, as always in the past, is a necessary article of consumption and will find a market regardless of the activity of manufacturers of competitive materials. As the realization is forced upon them that those competitors are actively gaining a foothold they have been more indignant than genuinely alarmed over the situation. However, this condition of mind has rapidly been changing in the last year or so, and the result is that lumbermen now appreciate the necessity for putting their commodity upon the same basis of scientific manufacture and merchandising as does the manufacturer of competitive materials. This realization is going to result in the manufacture and merchandizing of lumber in such shape that it will be just as completely applicable to exacting requirements as is concrete. The builder of a concrete structure knows that a certain beam or a certain column must be designed to a certain size and form for a particular purpose. The user of wooden beams, because of the inactivity of lumbermen in informing themselves as to the provisions of building specifications and because of their laxity in actual manufacture, have considered timber as not dependable for scientific designing.

When this issue is met squarely by lumber interests there will follow, or probably there will be established in conjunction with these changes for the better, researches aimed not at tearing down the merchandizing structure built by the concrete advertisers, but aimed rather at establishing the good qualities of wood and its adaptability under all conditions where it can be used. The lumberman will turn his attention to the fullest development of those fields in which lumber is unquestionably preeminent in its utility, and will not foolishly buck opposition where some other material is perhaps better. Until that condition comes to pass the fight against the wood substitutes will be carried on on an unfavorable basis.

Such catastrophies as the Edison fire do not prove that wood is a better building material than concrete or steel, nor do they prove that concrete or steel is a better building material than wood. They do prove, however, that no material under such rigid tests can possibly endure.

Making Good the Waste

EXPORT FIGURES are beginning to tell the story of waste in the European war. Of course no figures tell the whole story, but since the waste in certain articles is made up by exports from the United States, the figures give a hint of the destruction in certain directions. Horses, wagons and automobiles may be taken as examples. They wear out rapidly in war and as fast as the old becomes useless, new must be provided if the campaigns are to go on. In times of peace supplies are needed in moderate quantities only; but as soon as armies are set in motion the waste begins.

In October, 1914, there were shipped from the United States to England three times as many automobiles as in the corresponding month last year, and five times as many went to France. England's purchases of horses in this country during that month, compared with the preceding October, increased thirteen fold. The purchases of wagons for the same period for export to Europe increased one hundred and forty-one fold.

It is believed that the largest shipments of these war materials did not begin until after October, and it is probable that export figures will continue to increase for some months. The life of a horse is usually short in an active campaign. The automobile goes fast and far, but it does not go long. A wagon which is good for years of service on the farm or in ordinary road traffic will last only weeks or at most only a few months in war. The roads along which the armies advance and retreat are strewn with wrecks.

That waste must be made good constantly or the army will soon be placed hors de combat. The supplies which go from America are in addition to those which the countries directly concerned can supply for themselves. The value of a wagon or an automobile depends largely upon the wood used in its construction. America has the best wood in the world for vehicles. It has the whole supply of hickory, since this incomparable wood grows in no other country. American oak may not be better than the oak of Europe, but it is more abundant and much cheaper. Oak and hickory are the chief vehicle woods, but hard maple, beech and yellow poplar are valuable for certain parts of vehicles.

World Markets for American Lumber

BY HU MAXWELL
NINTH ARTICLE

Editor's Note

The Arab slave dealer, in search of human chattels, no longer threads the paths of Africa, as he had done for six thousand years. That continent still contains 140,000,000 black people; its deserts, forests, rivers, swamps, lakes, mountains, and plains are still there; but the white man is now in charge. Europeans are the rulers of practically every mile of Africa, and the white man's civilization and progress are replacing the barbarism and stagnation which blighted that continent during so many ages. The English, German, French, Portuguese, Italians, Belgians and Dutch are the ruling classes there. Some of the black people are accepting civilization; others that cannot accept it are disappearing under the pressure of progress, much as the American Indians disappeared. Contrary to former opinion, much of Africa is fit for the home of white men; and the white men are taking possession. The transformation has been rapid in recent years. Railroad trains now run over the routes cut by Livingstone, Stanley, Sparks, and Baker through the jungles. It was not many years ago that Khartoum and Feshoda were so far beyond the white man's influence that Chinese Gordon was left to his fate because no succor could reach him. Now the spot where he was murdered is a civilized city. Uganda was recently ruled by witch doctors. It is now crossed by railroads. Where a few years ago pigmies lived like badgers in holes, bacteriologists are now studying tropical diseases in well-equipped laboratories. Where the wild Cameroons a generation ago were signaling their declarations of war by pounding on drums made of hollow trees, the wireless station is now signaling a thousand miles. Thus Africa has passed and is passing from darkness into light. The change will go forward with accelerated rapidity, and the field of trade and opportunity will enlarge.

Africa is second in size of the five continents. Asia alone is larger. Africa is the poorest in developed resources, but its potential wealth is very great. Nearly the whole of Africa lies in the torrid zone. It is usually considered the type of all that is dry and hot. The largest and most sterile desert in the world lies there, and covers an area larger than the United States.

The continent's total area is 11,500,000 square miles and one-half of it is classed desert. Yet all parts of the deserts are not alike. Some portions are no worse than some of the plateau regions of the United States where water can not be had for irrigation; but other portions are such complete wastes that they support no living thing, either plant or animal. The chief desert is known as the Sahara. Until the camel was introduced by Arabs about 1,300 years ago it is said that it was physically impossible for human beings to reach or cross some portions of the desert; but the camel (properly called "the ship of the desert") has enabled men to reach practically all parts of the Sahara.

Various places, some of considerable extent, have been discovered in various parts of the desert area, where water rises to the surface if wells are bored, and these situations are fertile and produce enormously. The first artesian wells in the world were bored by the French in the Sahara desert.

These facts would be of no special interest to lumber exporters were it not for the fact that possibilities exist for developing a market for lumber in the very depths of the greatest desert on earth. The French have already penetrated long distances into the inhospitable wastes and have opened the way for railroads and trade, though as yet it is only a beginning. The Italians have now secured a foothold in Tripoli, by driving out the unprogressive Turks, and they may be expected to follow the example of the French and develop the waste places wherever possible. The English are already working round through Egypt and the Soudan, and will open the way from the south into the Sahara. No remarkable development is likely, but it should surprise no one if railroads square across the Sahara are built before many years; and then the American exporter can ship lumber to Timbuctu, if he wants to do so. From the north, railroads have already penetrated some distance into the desert.

There is not enough timber in the northern half of Africa to supply even the small local demand. Egypt has a few planted trees, and the mountain ranges south of the Mediterranean coast produce some forests. Those mountains were heavily timbered two thousand years ago, under the Roman dominion, but the modern Arab would rather have five goats than five hundred acres of timber, and in many localities in recent centuries the hills have been deliberately stripped of their forests to make indifferent goat pastures.

EAST AFRICA

The eastern coast of Africa is 4,000 miles long, crossing the whole torrid zone. It contains no timber of importance, though some of the kinds are valuable. African cedar, suitable for lead pencils, is reported some distance inland, but precise information concerning the quality is not available. Some of the best ebony on the market comes from East Africa, but not in large amounts. The Egyptians

cut ebony there 5,000 years ago and carried it in ships across the Indian Ocean, the Gulf of Aden and the whole length of the Red Sea. It was used by furniture makers and one of the pieces of furniture has survived till the present time. The Egyptians procured locust wood in the same region and samples of it have survived. But there probably never was enough timber in all that long stretch of coast to tempt a modern lumberman, and there certainly is not enough now. There are many thickets but the growth is scrub.

It is in that region, particularly in the Portuguese East Africa possessions, that some of the best markets for American forest products are found, as will be shown in the statistics below. Development is fairly rapid there, considering the vastness of the country and the utter lack of progress on the part of the natives until they come under the influence of Europeans. They are now building long lines of railroads connecting the coast with the interior. Timbers for trestles, bridges, platforms, warehouses, stations and other necessary work connected with railroads will call for more material from America. The "Cape to Cairo" railroad, which already covers half of the distance between the extreme southern and extreme northern regions of Africa, runs nearly parallel with the eastern coast of Africa the whole distance.

The European war affects the whole region. The railroad from Cape Town to Cairo lies on the land of the belligerents every mile of the way. German East Africa is wedged in between British possessions on the north and British and Portuguese on the south. Development may be hindered on account of the war, but there should be in that region a permanent market for American lumber, furniture and vehicles.

SOUTH AFRICA

South Africa belongs to the British, German and Portuguese. It is the most highly developed part of the continent, except Egypt and portions of the Mediterranean coast westward. It is the best market in Africa at present for American forest products. The war has greatly upset business there, but that can be only temporary, and greatly increased trade should follow within a short time. The country has so little timber that even railroad crossings are imported from Australia and India. Thus far none of the business has come to the United States. Our trade with South Africa consists chiefly of structural timber, lumber and manufactured forest products like furniture, cooperage, woodenware and vehicles.

Some writers on South Africa, who content themselves with speaking in general terms, mention forests of large area; but when their statements are pinned down to facts and investigated, the forests largely disappear. There is much thorny brush, some of it barely high enough to hide a galloping Hottentot, but timber trees are few. Some of the brush land, which was formerly thought worthless, has been fenced and is now used as ostrich farms, much as our western mountain forests serve as sheep ranges.

James Bryce's book, "Impressions of South Africa," removes some of the popular misunderstanding regarding the forest resources of that region. He found few trees more than fifty feet high, and they are usually far apart, deformed and thorny. The forests, if

they may be so designated, over extensive tracts, are less than ten feet high. A cactus, known as prickly pear, was carried from the United States to South Africa many years ago and has spread over thousands of square miles, often rendering travel across country well nigh impossible. The same cactus from the United States has gained an alarming foothold in northern Africa.

A few patches of original forest contain trees of good size. One of these is known as the Knysna forest. It is more famous for the lions in it than for its timber. When South Africa was first settled by Europeans lions roamed the country in enormous numbers and the farmers had to wage incessant war against them. The beasts even broke into the stables and ran through the gardens by day as well as by night. But they are all cleared out of South Africa now, except a small remnant which has taken refuge in the Knysna forest.

The South Africans have planted timber which has grown well. Oaks planted near Cape Town by the early Dutch settlers are now of great size. Eucalyptus from Australia has been widely planted and grows rapidly. The pines of Europe, the stone, cluster and Jerusalem pines, also thrive. The success attending these efforts warrants the belief that much of the country will ultimately be re clothed with timber. It is thought that original forests once covered much of South Africa, but were destroyed by centuries of forest fires which the Hottentots, Kaffirs and other nations purposely set to provide pasturage for their roaming herds of cattle.

There is no lack of kinds of trees still in the country, though most are stunted and small. James Bryce collected leaves of fifty-four species and when their identity was worked out at the Kew gardens in England it was found that eleven of them were new to science. That was in 1900 and shows how little had been the work done by botanists in South Africa up to that time.

WEST AFRICA

From this region comes what is known in commerce as African mahogany. There are several species, but it is doubtful if any one of them is true mahogany, though they are valuable and take the place of mahogany, and from the lumberman's standpoint it is not important what the botanical names may be.

The region which is here designated as West Africa follows the coast from the Portuguese possessions to the western end of the Sahara desert at the Senegal river. The distance, following the indentations of the shore line, is about 2,500 miles, but only 1,600 in an air line. The strip of forest varies from fifty to one hundred and fifty miles in width. Numerous timber trees, besides mahogany, abound, though the botanical classification has not been well worked out. Many of the timbers are of great value and others appear to be valuable, though tests by actual trial have not been made.

There is little doubt that this is the most valuable timber region of Africa. One of its most promising features is that the climate is so damp that forest fires will not burn, consequently the forest will survive. It is hard to destroy a forest by lumbering alone.

America is now sending little lumber to that part of Africa, but an increase in the trade is probable. It is not likely that we can compete with the woods which grow in West Africa for purposes for which they are suitable, but they are all hardwoods. As that country develops there will be demand for structural timber and it will naturally come from the United States. The people of that part of Africa will not build railroad trestles, warehouses and fences of mahogany. They will sell their mahogany at a high price and buy cheaper and better woods from us for those purposes. That will not be the only instance where people sell one kind of wood and buy another. The Mexicans sell us mahogany and take their pay in yellow pine and Douglas fir. The Africans of the west coast will doubtless do the same.

Back of the timber belt along the coast lie hundreds of thousands of square miles of grass lands which now contain few people, and they are not in the market for our lumber, but the possibilities for an increase in our lumber trade with that region are good.

THE DARK FOREST

The extensive wooded region explored by Henry M. Stanley on the tributaries of the Kongo river, and called by him the Dark Forest, has an area of 321,000 square miles, according to Stanley's figures.

He traveled 1,670 miles through the forest, and the second volume of his work, "In Darkest Africa," contains between fifty and sixty pages descriptive of the region. The forest is about as large as Texas and Louisiana combined. It lies on both sides of the equator and is drained by tributaries of the Kongo river.

That immense wooded tract has been the subject of much interesting discussion. Some suppose that in the future it will figure largely in the world's lumber supply. It may do so, though it is somewhat doubtful.

Unfortunately, the three-score pages of description by Stanley gives little information that can be turned to account in estimating how much merchantable timber is on the tract. Stanley did not see things from a lumberman's eyes. He gives no figures to enable one to estimate how much lumber might be cut, and says very little about the quality of the wood. He gives no botanical names and the common names which he supplies mean very little to a lumberman. The trees range in height from twenty to 180 feet and in diameter from six inches to four feet. That is about all he says regarding size, and furnishes no information as to the relative numbers of large and small trees. He speaks of endless tangles of vines and creepers, loading the trees from their crowns to the ground, and of impenetrable jungles of vegetation near the ground, through which it is necessary to cut paths with hatchets. From this it may be inferred that lumbering operations would be expensive and disagreeable.

The heat is oppressive, rains fall in torrents, lightning is terrific, wind storms are fierce and insects are worse than the plagues of Egypt. If the traveler does not keep moving he is bit by myriads of ants, and if he moves the wasps sting him. Stanley says that trunks of trees that fall are speedily devoured by insects. A person can hold his ear to a log and hear the hum and buzz of insects that are eating the wood. The forest is filled with snakes, apes and other vermin that are undesirable associates.

These details are interesting but they give little information concerning the probable competition that may be expected from that quarter when the American exporter sends forest products to the west coast of Africa. There was, of course, no market for American lumber in that region in Stanley's time, and except on the immediate coast there is none yet. Considerable changes are taking place and greater changes may be expected to follow. The Dark Forest is now included in the Kongo Free State, a country of 900,000 square miles and 30,000,000 people. It is the most populous country of Africa and its agricultural possibilities are great, when railroads have opened it to the world. The Cape to Cairo railroad follows near its eastern frontier for 500 miles, and when railroads or canals have been built around the falls of the Kongo that river will afford an outlet to the Atlantic ocean. However, that is yet in the future.

AREA OF POPULATION

In a campaign for increasing trade, it is of importance to know the area and population of the various countries, colonies and protectorates of Africa. With regard to population the figures are often estimates, but the areas are more definite. Even these are not always enclosed by fixed borders, for political geography in Africa is not on a firm basis. The war now in progress will probably still further disturb boundaries.

Country	Square miles	Population
French possessions.....	3,756,760	31,602,000
British possessions.....	2,832,655	49,462,000
German possessions.....	908,000	5,720,000
Turkish possessions.....	900,000	11,800,000
Kongo Free State.....	900,000	30,000,000
Portuguese possessions.....	795,270	7,589,000
Italian possessions.....	643,000	1,850,000
Abyssinia.....	400,000	3,500,000
Morocco.....	220,000	5,000,000
Spanish possessions.....	83,800	519,000
Liberia.....	45,000	2,000,000
Total.....	11,585,485	149,042,000

The above figures do not include changes due to the war recently concluded between Italy and Turkey. The Italian possessions should be largely increased and those of Turkey correspondingly decreased.

It may be remarked in passing that chances to sell American lumber are probably better under Italian than Turkish rule.

TRANSPORTATION

Seagoing vessels cannot make much use of Africa's rivers. They are either too shallow or they are obstructed by cataracts. The Nile is the longest river in the world; the Kongo is exceeded in volume only by the Amazon; the Niger and Zambezi are large streams, but as avenues of trade between the interior and the sea they are at present of little value. Small vessels can sail thousands of miles on their upper courses between, above and below the rapids which are met with in many places.

Railroads supply the only means of transportation which lumbermen can use between the ports on the coast and the interior. These roads are at present capable of handling all the business that comes to them. Most of the good ports have railroads running some distance inland, some of them hundreds of miles. Lack of transportation facilities is not a hindrance to the extension of the American lumber trade in Africa. Beyond the termini of the railroads there is at present little demand for forest products, such as we have to sell.

The distances from the eastern and Gulf coasts of the United States to the African ports are not so great as those from our Pacific ports to eastern and southern Asia and to Australia. The eastern African coast is somewhat farther away but is within easy reach. American lumber is finding its way to eastern Africa along the whole line from Egypt to Cape of Good Hope. It is no trouble to send cargoes; the only trouble consists in finding markets in Africa. We compete there with Australia, India and the countries of northern Europe, and the present demand is small in proportion to the vast extent of country. What we have is worth holding and the prospect is excellent for securing more.

EXPORTS

Our forest products exports to Africa for 1913 show that the range of commodities is extensive. A beginning has been made in nearly all lines and in some of them the progress has been encouraging. Figures somewhat in detail concerning the American lumber trade there are given below, all of the statistics being for 1913.

TIMBERS

Africa is not a promising market for American round and square timber. It is a fact that Africa sells us more of such timber than it buys from us. It has mahogany, ebony and cedar for sale in the log, and it buys hickory, beech, walnut and longleaf pine. Its purchases in 1913 amounted to \$3,892 worth of hickory, all of which went to British South Africa; \$208 worth of black walnut, which went to the same market; while Portuguese Africa paid \$300 for miscellaneous round logs. Longleaf pine went in sawed square logs as follows:

British South Africa.....	\$159,950
French Africa.....	147,912
Portuguese Africa.....	132,094

LUMBER

Rough lumber of several species reaches various parts of Africa from the United States. Fir, presumably Douglas fir from Washington and Oregon, was bought last year to the value of \$80,880 by British South Africa. The same market took gum invoiced at \$1,948, and Egypt bought to the value of \$1,320. No other gum went to that market last year. South Africa purchased \$24,646 worth of ash, and the purchases of this wood by German Africa amounted to \$123. White pine has a fairly good market on the Dark Continent and was sold in amounts shown below:

South Africa.....	\$125,406
British West Africa.....	5,853
Portuguese.....	4,908

The Portuguese colony is the largest African buyer of longleaf pine lumber, though eight states or colonies purchased the article last year to the following values:

Portuguese.....	\$164,458
Canary Islands.....	67,379
South Africa.....	63,215
French Africa.....	39,192

British West Africa.....	35,760
Morocco.....	16,739
German possessions.....	1,346
Liberia.....	1,219

Other yellow pine, the exact kinds not being specified, was exported to the countries named: British possessions, \$56,389; the Canary Islands, \$9,742; Portuguese, \$3,267, and Liberia, \$569.

South Africa bought yellow poplar to the value of \$63,882, Portuguese \$3,504, and the German possessions took \$100.

The spruce shipped to South Africa was worth \$7,816, and that to the Portuguese possessions \$2,760.

Sales of various other lumber is here shown: South Africa, \$9,396; Portuguese colonies in East Africa, \$1,331; Canary Islands, \$1,250. The Canaries imported from the United States joists and scantlings worth \$22,703 and the Portuguese bought to the value of \$90.

BOXES AND COOPERAGE

The Africa market for boxes and cooperage materials is reaching respectable proportions. South Africa in 1913 bought box shooks from us to the value of \$3,939, and Liberia's purchases were worth \$168. French African colonies imported \$900 worth of barrel shooks, and South Africa \$526. Staves, however, constituted the largest item of cooperage, of which French Africa took \$30,056, South Africa \$29,124, and the Canary Islands \$676. Miscellaneous articles of cooperage imported into various parts of Africa were valued at \$50,385. To this should be added empty barrels worth \$6,212.

DOORS, SASH, AND BLINDS

South Africa.....	\$161,086
Portuguese possessions.....	15,897
Liberia.....	496
German Africa.....	116

FURNITURE

South Africa.....	\$196,200
Portuguese possessions.....	15,918
Egypt.....	10,494
French Africa.....	8,715
British West Africa.....	4,379
Liberia.....	2,837
British East Africa.....	2,364
Canary Islands.....	2,136
Morocco.....	870
Belgian Kongo.....	354
German Africa.....	344
Tripoli.....	125
Madagascar.....	61

The exports of incubators and brooders to Africa have not yet attained large proportions, but the following figures show that a good beginning has been made: British possessions, \$7,793; Portuguese, \$195; Egypt, \$40; French Africa, \$9.

Interior house trimmings were shipped to South Africa to the value of \$29,854, Portuguese possessions \$714, and Egypt \$37.

Woodenware to the value of \$35,133 went to British possessions and Egypt took \$37 and South Africa bought wood pulp worth \$9,209.

CARRIAGES AND WAGONS

	Carriages	Wagons
British possessions.....	\$32,298	\$21,536
Portuguese.....	3,728	6,901
German.....	3,431	739
French.....	542	1,066
Egypt.....	445	72
Canary Islands.....	333	197
Spanish Africa.....	150
Madagascar.....	85

WHEELBARROWS AND HANDCARTS

British Africa.....	\$60,072
Portuguese.....	1,927
French.....	400
Egypt.....	224
German Africa.....	10

MISCELLANEOUS

British Africa.....	\$161,369
Portuguese.....	15,645
French.....	1,843
Liberia.....	1,252
German.....	1,213
Egypt.....	915
Madagascar.....	18

SUMMARY

The summary of all forest products exported from the United States to the various provinces and colonies of Africa in 1913 is as follows:

Longleaf pine timbers.....	\$ 439,956
Longleaf lumber.....	389,314
Furniture.....	244,797
Doors, sash, and blinds.....	177,671
White pine lumber.....	136,167
Fir lumber.....	80,880
Miscellaneous yellow pine.....	69,967
Yellow poplar.....	67,526
Wheelbarrows and handcarts.....	62,632
Staves.....	59,856
Miscellaneous manufactures.....	47,985
Carriages.....	41,012
Woodenware.....	35,334
Wagons.....	30,511
House trimmings.....	30,105
Oak lumber.....	24,769
Scantling.....	22,793
Miscellaneous lumber.....	11,977
Spruce lumber.....	10,576
Pulp.....	9,209
Empty barrels.....	8,037
Round logs.....	4,400
Box shooks.....	4,107
Gum lumber.....	4,078
Headings.....	2,500

TRADE WITH AFRICA

Portions of Africa have held important places in the world's trade since the earliest history, but the trade of the world was very small in remote times. The Africans always had something to sell and were always willing to buy. The Egyptians had grain for barter while surrounding peoples were starving. The same corner of Africa was carrying on a lumber business with Syria a thousand years before Solomon sought cedar and fir in Lebanon for his temple. Carthaginian ships were trading with every known country at a time when the site of Rome was a sheep pasture, and skin-clad Britishers were chubbing wild hogs in the wilderness where London now stands.

Africa is still open for business with the world. It still has articles for sale, but trading is now on a larger scale than when the Somalians went on long trading trips to swap an ox horn of musk for an ox horn of salt, or when Egyptian ships spent four months in procuring a cargo of ten thousand feet of cedar logs and conveying them two hundred miles.

Africa now sells cotton, sugar, rubber, tobacco, coffee, wool, cattle, goats, skins, grain, logs, gold and diamonds. These include the cheapest and most costly commodities in the world, and they go to all parts of the civilized trading world. There is no scarcity of commodities to exchange for our forest products. The continent of Africa is 16,000 miles in circumference, and almost every port is a prospective center for the purchase of our lumber or of articles made wholly or in part of American wood. Development is very rapid in many parts of Africa and lumber is one of the things which will be needed in large amounts, and much of it must come from distant countries.

National Forest Fires in 1914

The season of 1914, according to the officials of the Forest Service, carried greater danger from fire to the national forests than any year since the establishment of the national forests. To meet this emergency and to prevent great loss of public property the Department of Agriculture was obliged to exceed the amount appropriated for fire protection and incur a deficiency of \$349,243. The conditions of drouth and other factors of forest fire hazard were said to be worse than in 1910, when the disastrous Idaho fires occurred.

Weather bureau reports show that in most of the Rocky mountain and Pacific coast region last winter's snows were much below the normal, and as a result there was an early spring and an early drying out of the forests. In western Montana and northern Idaho there were forest fires in considerable numbers by the end of May and they continued until October. In California, where there is normally a very long season of drouth, the fire season started in some portions five weeks earlier than usual, and in the southern part of the state the fire danger was still great at the end of November. A long dry season, sustained periods of high temperature, recurring hard and steady winds, and in certain places unusually hot, dry nights rendered the forests exceedingly inflammable and the problem of fire prevention unusually difficult.

MORE THAN SIX THOUSAND FIRES

The total number of fires during the season of 1914 which threatened the national forests and which had to be handled by the protective organization of the Forest Service were 6,112, or about 1,000 more than occurred in 1910. This number represents the fires reported up to December 1. At that time reports indicated that there was still a dangerous condition in southern California and in certain portions of the national forests of the east. The service says that the total for the year will be increased by fires in these regions during December.

The most serious conditions are reported from western Montana and northern Idaho and on the Pacific slope. The weather conditions in the central and southern Rocky mountain regions were more nearly normal. As a consequence only fifteen per cent of the total

number of all national forest fires occurred in these regions and they were handled without difficulty and with very small loss of property.

Of the entire 6,112 fires which threatened the national forests, eighty-one per cent were extinguished by the protective organization before they had covered ten acres. The percentage of fires that burned over more than ten acres was smaller than in any previous year.

While detailed reports have not yet been received appraising the exact loss to the government through the forest fires, a preliminary estimate shows that the loss of merchantable timber will probably not exceed \$400,000. In 1910 the corresponding estimate of loss was nearly \$15,000,000, but later estimates materially reduced the amount. Through the work of the protective force the fires this year were largely confined to old burns and to less heavily timbered areas. The loss to the government through the destruction of young trees which had sprung up in these openings is larger than the actual loss to green timber, though it is always a difficult matter to estimate the loss resulting when a fire runs through an extensive region abundant in young growth.

REGION OF GREATEST DANGER

In Montana and Idaho alone it is said that the value of specific bodies of timber which were threatened by the approximately 2,000 fires which started and were put out, aggregated the enormous sum of over \$59,000,000. It was in this section that the largest amount of money had to be spent to prevent a recurrence of the great disaster of 1910. In Oregon and Washington the 1,200 fires which were handled by the department threatened upwards of \$24,000,000 worth of timber, and these figures, according to the department experts, do not include the value of non-merchantable timber and young growth on about 5,000,000 acres of land, and several million dollars' worth of ranch and other private property which lay in the path of the threatening conflagrations. Figures are not yet gathered of the precise amount of damage threatened by fires in California and other national forest states, though they are expected to add large amounts to the total value of the property threatened and saved.

Three Dozen Chances for Gain

Editor's Note

The following paper was read by F. F. Chandler, a manufacturer of boilers and engines at Indianapolis, Ind., before the annual meeting of the National Veneer and Panel Manufacturers' Association, held at Chicago, December 8 and 9.

After having spent a good many years in studying, designing, selling and installing power producing plants I have come to the general conclusion that this department of most manufacturing institutions is the most neglected and is more wasteful in proportion than any other. Take you, as veneer manufacturers for instance. How many of you can truthfully say that you know as much about the correct theory and modern practice regarding your power plants as you do about the correct theory and practice of the operation of these other machines in your factories which actually fabricate your product? Is it not true that you are constantly figuring on the time when you can afford to buy a better veneer saw or a veneer dryer, or a better knife grinder, mortiser, tenoner, or what not? Are you not constantly figuring on how you can route your material through your factory to better advantage. These things are all proper subjects for your best thoughts. Please don't think that I hold the opinion that the power plant can possibly be the most important part of your business, but it is primarily a very important thing as you well know. A few minutes stopping of the machinery totals up to several hours of lost time when all the employes who are made idle are considered.

How many of you are operating entirely on refuse matter produced by your mills? Would you like to? I know the answer is yes without asking you to speak it. It may not be possible for all of you to operate entirely on waste matter because the waste matter you produce may not have the proper number of heat units to produce the power you need, but if you are buying any coal at all would it not be interesting and profitable to you to buy less than you are now purchasing? Even in plants where slabs are practically used along with sawdust it should be profitable to save the slabs and sell them for fuel if you can thereby produce a little more revenue.

To make a long story short, if you are interested in reducing or eliminating your coal bill or in reducing the amount of salable wood which you are now burning, then you should be interested in some of the things I can and will tell you.

The whole subject of economical power production can be summed up in three words, "Stop the leaks." All losses which can possibly occur in the production of power can be attributed either to loss of heat or to mechanical friction or slippage of pumps. The study of those places where the greatest amount of loss can occur is, of course, the most profitable. Without any hesitation I can say that the greatest source of loss in most plants is in the uneconomical way that steam is generated. The next greatest source of loss is in not utilizing the heat value in the steam exhausted from the engines. Losses to a greater or a lesser degree are to be found in many other places and I will therefore number each point showing how each becomes a chance for gain.

PROPER ROUTING OF STEAM IMPORTANT

In these days when many central electric light stations are offering current for power purposes at very low figures you have a very much better reason for looking upon your power plants as an investment rather than an expense, because you have a waste product in a form which can be used as fuel for making power. Therefore you should strive to keep your ledger account for purchased fuel or electric current as low as possible. These accounts can sometimes be eliminated by making your power plants sufficiently economical to make much expenditure unnecessary.

It is somewhat difficult for me to talk to you in a way which all of you will understand for some of you undoubtedly can generate sufficient power with your waste products while others cannot.

For those who do have a purchased fuel or power account let me say that the production of heat and the routing of it without wasting it through your furnaces and boilers and pipes and engines, etc., is just as important an item to you as the proper routing of the

material through your factory. You are all interested in the economical routing of the material and you know something about how it can be accomplished, but how many of you know about the economical routing of heat and about making it produce all the work possible?

HEAT LOSS IN FURNACE, STACK AND PIPING

For those who are interested in the reduction of coal cost, current cost, or in the increase of salable wood, the following points can be looked to with great benefit.

To go back to heat loss in furnace and stack. For the kind of fuel to be burned a study of the best form of furnace and setting will produce profitable results. Strange as it may seem to you the type of boiler is not important so far as economy is concerned, but the design of the furnace, the floor space, and initial cost of installation is. A correct type of furnace for the fuel to be burned will produce good results with any type of boiler. The problem is to produce the required amount of steam with the least possible expenditure of fuel. The power house equipment which should have attention to get this result is: Rocking and dumping, or hollow blast grate; down draft furnaces; Dutch ovens and other forms of special furnace construction; automatic stokers; induced, forced, or balanced draft; well-designed stacks; superheaters; economizers; feed water purification; soot removing equipment; mechanical scale removers; feed water heaters; boiler room instruments; hot wells; economical pumps; coal handling equipment; ash handling equipment.

Here are eighteen places where gains can be made, and I have not yet gotten out of the boiler room.

Now comes the piping suggestions as follows: Good pipe covering for both steam and exhaust lines; steam separators or drip pockets; steam traps; tight gaskets; correct piping arrangements.

Before I leave the points which relate to piping, I wish to say that the only leaks in a plant which can actually be observed by the naked eye are those which permit the blowing of steam caused by bad gaskets and packing. Do not think, however, that you have saved all the leaks when you have stopped these.

MONEY IN EXHAUST STEAM

In the engine room we have saving possibilities in economical steam engines or turbines; jet, surface and barometric condensers; economical generators; well arranged switch boards.

I have already stated that by far the greatest loss in power production results from incorrect methods in the production of steam, and that the next place where the greatest gain can be made is in utilizing to the fullest extent the heat that remains in the exhaust steam.

In order that you may more fully realize the value of this point, and why you should not let a cubic foot of steam go to waste into the atmosphere, I wish to tell you briefly about how heat is distributed in converting water into steam and *vice versa*.

To convert well water at say 60° F. temperature into steam at 100 lbs. pressure, requires 1,157 British thermal units per pound of steam, a British thermal unit being a measure of heat value just as a pound is a measure of weight. Now then when this pound of steam is expanded through the engine or turbine and then exhausts into the atmosphere it contains a total of 1,119 of the original 1,157 units put into it. So you see the actual work done in the engine is done with a very little heat loss. When the steam exhausted is cooled sufficiently so that it again returns to water it gives up 965 of the total 1,119 British thermal units in it which you will immediately see is a very large per cent and the water of condensation resulting is at a temperature of 212°.

Now as a very large per cent (in this case eighty-five per cent) of the original heat value put in the steam is blown out of your exhaust pipe, can't you see that if your steam is costing you any-

thing at all to produce it is well worth while utilizing in some other way. How many of you use your exhaust steam for steam heating or boiling glue pots, etc.

The exhaust steam wasted in the United States in one day would make one fabulously rich.

One of the most surprising things in connection with the money value of exhaust steam is that while it is one of the most valuable heat transmitting mediums yet it can also be made to produce ice and refrigeration in a most surprising way, without the use of any moving machinery, except a few small pumps.

If I were to tell you that the exhaust steam from the average 100-lb. engine, if it were kept running twenty-four hours at full load, could be made to produce about forty tons of ice in that time, you would gasp—but it is the truth, nevertheless.

Some ice companies are actually paying out real money for the purchase of exhaust steam, so valuable is it in ice production, and yet the majority of you throw it away.

I can point out plants in this country which are producing ice by this process for from thirty to fifty cents a ton and I expect most of you pay almost this much per hundred pounds.

FURTHER MONEY-SAVING POSSIBILITIES

There are a few more places in a power plant where money can be saved and to which you, as owners, should also give some supervision and attention. They are: Line shaft alignment; group motor driving; piston and valve rod packings; electrical wiring; convenient plant arrangement; efficiency of your employes.

I could really go on to tell you of many more points worthy of attention. How, for instance, many plants have from twenty-five to fifty per cent more boiler capacity than actually necessary, and how some plants I know of have cut their coal bill to absolutely nothing, but I think I have told you enough to start you thinking. I could tell you with fair degree of accuracy what per cent of saving could be made by the employment of these various suggestions, but it is too long a story for one day.

With steam at 100-lb. pressure, if liberated through an orifice 1 inch square, a quantity will escape which will be equivalent to almost 200 boiler. As an orifice 1 inch square has a diameter of about 1 1/8 inches, you will see how easy it is to lose money by permitting steam leaks to exist. Think also how the sum of all the little leaks in your plants may mount up into a sum which means a material loss.

A veneer plant has a large use for hot water for boiling blocks. I am not sufficiently informed regarding the details of veneer manufacture to know if these have to actually be boiled or not. If they do, then live steam will be needed if steam is used. Under such circumstances it is a question in my mind if you can afford to use steam for boiling blocks providing you have to buy coal. Of course if you have plenty of offal for fuel then it really does not make much difference.

I think if I had a veneer plant and had to buy coal I would design my boiling vat to burn the fuel under it and then locate it so my firemen could attend to it just as they would a boiler. The reason for making this statement comes from a knowledge of the heat values of steam and fuel. A little inspection into a steam table will give you the reason clearly.

If your feed water is at a temperature of say 180° on entering your boilers, then it will require 176 British thermal units to raise it to a temperature corresponding to 125 pounds steam pressure before the water is in a condition for steam making. Then a further amount of heat has to be given to this heated water to evaporate it. This amount is 865 British thermal units. In other words, the total heat to produce steam which has to be applied to each pound of feed water which is at 180° temperature is the sum of the given amounts which equals 1,041 British thermal units. The temperature of this steam is 352° F. Now with this little explanation of the heat required to generate live steam, let us go backward with it. If used for boiling blocks, this steam is turned into the tank. In giving up the heat necessary to boil the water the steam is condensed and the condensation is led off by means of a trap. If the water led off by this trap is at a temperature of 212° then the live steam

gives up 965 British thermal units when it condensed into water. Please remember, however, that we put 1,041 British thermal units into the steam so that we show a loss of 76 British thermal units, or about 7.2 per cent, which is just the amount of fuel wasted by heating the vat with steam as compared to heating it direct.

This deduction is made on the assumption that the method of burning the fuel under the vat would be as economical as the burning of fuel in the furnaces under the boilers. The saving I have shown does not necessarily mean that those of you who are boiling your vats direct with coal are doing so at a saving over those who are using steam, but it at least is the correct theory.

Unfortunately the only steam tables that most people are familiar with are those in dairy lunches. The tables I refer to are compiled for those who are interested in values of steam under different conditions, and are of inestimable value.

Baltimore Exports for November

The showing made by November in the export trade is in some respects not so good as that for the previous months, the total value of the shipments made constituting a loss of more than \$5,000. As compared with the same month last year the exhibit is also to be regarded as disappointing, but the fact must not be lost sight of that these are abnormal times, when the ordinary standards of measurement are at fault and when allowances must be made for unusual conditions. It appears from the statement that no logs at all were shipped during the month, against some 230,000 feet for November of 1913, and the forwardings of oak lumber also dropped to small proportions, being only one-third of those for November, 1913. Poplar declined in an even greater proportion, and the expectations raised by the statement for October were hardly borne out. But when everything is said that could be advanced, the fact remains that stocks are moving to a larger degree than might have been supposed under the circumstances and there are even indications that an expansion will take place in the future. There can be no doubt that the large accumulations resulting from the diversion of shipments to British ports have been in a measure absorbed, and that the current needs of the United Kingdom will consequently have a chance to assert themselves to a more pronounced degree. The statement for November, as compared with the same month of last year, is as follows:

	—1914—		—1913—	
	Quantity	Ft. Value.	Quantity	Ft. Value.
Logs, Hickory			92,000	\$ 2,660
" Walnut			100,000	6,731
" All others			40,000	1,900
Lumber, Oak	666,000	\$23,040	1,890,000	62,434
" White Pine	24,000	648		
" Yellow Pine	12,000	410	42,000	1,100
" Poplar	55,000	2,040	209,000	6,722
" Spruce			13,000	525
" All others	157,000	5,740	382,000	16,902
Shooks	1,572	1,764	1,130	1,283
Staves	7,435	1,220	24,926	1,790
All other manufactures of lumber		1,846		20,420
Furniture		3,041		2,084
All other manufactures of wood		5,693		26,284
Totals		845,435		\$150,835

Many communications are being received by the Department of Commerce regarding the increasing demand for ties in the war zone. While there doubtless is some scarcity of ties due to the unusually large numbers that have been used in the construction of military railways and in cribbing bridges, it is pointed out at the Forest Service that there is nothing in the situation to make a market for any large number of ties. There never was a time, it is believed, that consignment business was more risky. American dealers should not make shipments without orders at this time, experts here declare.

Only 7 1/2 per cent of last season's 400 fires in national forests of Utah, southern Idaho, western Wyoming and Nevada caused losses in excess of \$100.

Pertinent Legal Findings

Time for Removing Standing Timber

When a deed to standing timber does not limit the time within which the same is to be removed, the landowner is not entitled to maintain suit to cancel the deed on the mere ground that the purchaser has failed to cut and remove the timber within a reasonable time. (Mississippi supreme court, Forest Products & Manufacturing Company, 66 Southern Reporter 279.)

Payment for Lumber Inspection

According to a decision of the Michigan supreme court handed down in the case of Fish vs. Crawford Manufacturing Company, 79 Northwestern Reporter 793, a lumber company which has agreed to sell a quantity of lumber may be held liable for the whole inspection charges, where it appears that the inspector was agreed upon by both parties to tally the lumber, that the lumber company's representatives permitted him to complete his work and paid him one-half the charges, and that there was a local custom binding the seller of lumber to pay the entire inspection charges in the first instance at least.

Damages for Breaking Logging Contract

Where one who has contracted to conduct logging operations for a lumber company is prevented from completing the work on account of the company's repudiation of the contract, he is entitled to recover the contract price for all work done and the profits he would have realized from finishing the work. (Kentucky court of appeals, Wilford vs. Langstaff-Orm Manufacturing Company, 170 Southwestern Reporter 1.)

Enforcement of Contract to Convey Timber

Suit lies to compel a landowner to comply with a contract to convey all the standing timber on a certain tract; the buyer's remedy not being limited to a claim for damages for breach of the contract. A contract to deliver good title to standing timber on payment of an agreed price involves the performance of concurrent conditions; it is the primary duty of the buyer to tender payment, and when he does that the seller is obligated to at once deliver title. (United States district court, northern district of West Virginia; Wilson vs. Seybold; 216 Federal Reporter 975.)

Right to Rescind Logging Contract

The rule of law that mere failure to pay an installment due under a contract does not ordinarily justify the other party to recover damages on the theory of repudiation of the entire contract was applied to a logging contract by the Minnesota supreme court in the case of Beatty vs. Howe Lumber Company, 79 Northwestern Reporter 1013. Plaintiffs entered into a written contract with the lumber company to cut, boom and deliver logs, payment for the service to be made in installments, and on the company's failure to make one of the stipulated payments, plaintiffs elected to treat the contract at an end and recover not only for services already performed, but damages for preventing further performance.

Confusion of Lumber

There is an interesting principle of law that when one person wrongfully confuses quantities of goods belonging to him with those owned by another under such circumstances that the separate quantities cannot be ascertained, the former must bear the loss, and in a proper case may be denied the right to claim any of the confused mass. This principle was invoked in the case of Keweenaw Association vs. O'Neil, 79 Northwestern Reporter 183, wherein plaintiff sued to replevy lumber manufactured by defendant from logs cut from defendant's land. It appears that this lumber was commingled with lumber cut from logs which admittedly belonged to defendant. Answering the claim made by plaintiff that this commingling of the logs resulted in such confusion of property as to give plaintiff title to the whole, the Wisconsin supreme court said:

"The doctrine of accession through confusion of goods is old. But it involves a forfeiture, and is never applied where it can be consistently avoided. * * * (But this rule only applies to wrongful or fraudulent intermixtures. There may be an intentional inter-

mingling, and yet no wrong intended, as where a man mixes two parcels together, supposing both to be his own, or that he is about to mingle his with his neighbor's by agreement, and mistakes the parcel. In such cases, which may be deemed accidental intermixtures, it would be unreasonable and unjust that he should lose his own, or be obliged to take and pay for his neighbor's, as he would have been under the civil law. In many cases there will be difficulty in determining precisely how he can be protected with due regard to the rights of the other party, but it is clear that the law will not forfeit his property in consequence of the accident or inadvertence unless a just measure of redress to the other party renders it inevitable.' In such cases, as in those where the intermingling is lawful, as by agreement, the rule does not apply, and the parties become tenants in common of the whole. There is no reason why the same rule should not apply where the goods are identical in quality, and of equal value. * * * The record discloses no bad faith, and there is nothing to indicate a difference in quality or value of the lumber of the same kind. If, therefore, the plaintiff were entitled to the product of the two trees, he should have contented himself with a proportionate share of the lumber."

Receipt of Freight by Railway Company

A car was spotted for a shipper, and, it having been loaded, he notified the railway company of that fact, and stated that a bill of lading would be presented for execution in the morning. Thereupon the railway company switched the car to a point in its yards where it could be more readily switched into an outgoing train. While standing at that point during the night, the car and its contents were destroyed, and the carrier denied liability for the loss of the freight on the ground that it had not received the same into its possession. Held, that, notwithstanding the fact that no bill of lading had been issued, the jury was warranted in finding that the railway company had received the shipment for transportation. (Kansas City court of appeals, Morrison Grain Company vs. Missouri Pacific Ry., 170 Southwestern Reporter 404.)

Responsibility for Employee's Trespass

An employe is liable for willful trespass upon land and for wrongful cutting of timber thereon, in the course of his employment, although the acts were committed without the company's knowledge or consent. (Minnesota supreme court, Helleppie vs. Northwestern Drainage Company, 149 Northwestern Reporter 461.)

Buyer's Right to Rescind Contract

If a hardwood tank sold were not of the quality contracted for, the buyer was entitled to rescind his purchase and return the tank within a reasonable time. But before a purchaser is entitled to cancel his contract, the seller must be put in substantially the same position that he occupied before the contract was made. The buyer must return or tender back the property at the place of delivery, unless, upon making an offer so to do, he is relieved of the obligation by a refusal of the other party to receive the goods if tendered. It is not sufficient for the buyer to make a proposal to return the property, or to notify the seller that he holds it subject to his order. (Maine supreme judicial court, Stevens Tank & Tower Company, vs. Berlins Mills Company, 92 Atlantic Reporter 180.)

Logs Lost Pending Delivery

A contract to sell several thousand sawlogs provided for measurements in November and March, while the cutting was in process, and required the seller to brand all the logs, and deliver them at a point on a stream to which they were to be floated. Some of the logs were lost because not branded, they having been washed away by high water. Held, that the seller is not entitled to recover the value of these logs on the ground that if the buyer had measured the logs within the time required by the contract, they would have been branded and hence not lost, since the buyer's delay in measuring them did not exonerate the seller's contract duty to brand and take care of the logs. (Kentucky court of appeals, Swann-Day Lumber Company vs. Cornett, 170 Southwestern Reporter 516.)

An Easy Identification of the Oaks

A great deal has been written about the identification of the oaks. The Forest Service issued a bulletin on the subject but it was way over the heads of the men who have the most need of the information. What is wanted is a simple and easy way of telling white oaks from red or black oaks. Within these groups it is not very important, as a rule, to know the species. This is fortunate, for not even the experts with all their refinements of laboratory methods can make specific identification of the oak woods with any degree of certainty.

There are several characters distinguishing one group from the other but there are so many exceptions that any single feature may prove misleading. Take for instance tyloses, the froth-like tissue that plugs up some of the pores. They are commonly associated with white oaks but they may be absent in the sapwood, and may be present in abundance in the red oaks. Associated with this is the blowing test. You can blow through red oak wood but not through white oak—sometimes. This may help a little with small pieces but is largely dependent upon tyloses which may or may not be present in woods of either group. At best it is an unsatisfactory test.

There is one sure test with the compound microscope, using very thin sections across the grain. Such sections can be cut with a sharp pocket knife, and if one has a big microscope and knows how to use it, satisfactory results can always be obtained. The thing to look for is the character of the pores out in the summerwood. They have thick walls and are round in red oaks, but are thin walled

and angular in the white oaks. At least one firm that the writer knows of has gone so far as to equip its inspectors with compound microscopes which they are taught how to use in all cases of doubt.

But such methods are too refined, slow and expensive to appeal to most wood users and dealers, and it is to aid the ninety and nine that the following simple and sure test has been developed. The writer has tried it out repeatedly upon oak woods of every kind available and from all parts of the country and has checked his findings with careful laboratory methods and the test holds. Southern oaks prove exceptions to many of the usual rules applied in northern oaks, but by the present method are readily and positively classified in a minute.

This test makes use of the one constant feature used by experts with the compound microscope, but the only equipment necessary is a pocket knife and a small hand lens or pocket magnifier. Everybody possesses a knife and the lens can be purchased at any optical goods store for from fifty cents to a dollar. It will pay to get one costing upwards of a dollar and made to fold so as to slip into the vest or watch pocket. A good pocket lens is no bigger than the end of the finger. The only requirement for the knife is that it be sharp. If it is not sharp it will tear or crush the pores of the wood and obscure the structure so that the essential features can't be made out. A knife with a rounded edge is better than a razor as the blade of the latter is too thin to withstand cutting hard oak without nicking.

With the sharp knife cut off a portion of the rough surface of the end of the wood in question. The area thus smoothed off need not exceed half an inch square and if the wood is green it will cut very readily. It is best to choose a growth ring of considerable width where possible because a narrow ring of oak is composed mostly of large pores of the springwood and this test is not interested in them. What is wanted is a good view of the small pores in the darker and harder band of summerwood.

If you look at this band of summerwood with the naked eye you will see that there are lighter colored patches or lines running somewhat irregularly across it, sometimes appearing like tiny flames. It is at these that you want to look closely with the magnifier. The man who has had no experience with a small lens uses it as he would a reading glass; he puts it near the object but looks at it from a distance. The proper way is to put the eye right up to the lens and then get the object in focus. This means getting the wood about even with the tip of your nose. If you never tried this before you will be surprised how much more you can see and how much plainer you can see it than when the eye is at a reading distance.

Now look at the pores in the summerwood, not the big ones in the springwood, mind. Are these summerwood pores distinct? Can you see into them readily? *Can you count them readily?* If so, you are looking at a piece of wood of one of the red or black oaks. If on the other hand these small pores are indistinct, if you cannot see into them, or if there are so many of them that it is impossible to count them, then (assuming that the cut is a smooth one) you are looking at a white oak. If your cutting has been poor it will show up under the lens and the thing to do is to repeat the process until a smooth surface is made, whetting the knife meanwhile. In southern

white oaks of rapid growth it will probably be found that the pores in the summerwood are distinct enough to be seen individually; in fact, this may be the case with rapidly grown white oak in the North. In this event try to count the pores. In a white oak there appear to

be scores or even hundreds of them; in the red oaks there are usually less than a dozen in an irregular row.

This whole process is even more simple than it sounds and after a little practice anyone should be able *at a single glance through the lens* to tell a piece of white oak from a piece of red or black oak. The way to practice is to take specimens the identity of which is certain. From these the essential features are obtained. Compare others with them; a half-hour's practice should permit anyone to solve any oak separation problem that may come up, unless perchance the particular species or variety is wanted, which is another story altogether.

S. J. R.

Virginia uses more wood for boxes and crates than any other state, followed by New York, Illinois, Massachusetts and California, in the order named.

Apple wood, used almost exclusively for saw handles, also furnishes the material for many so-called brier-wood pipes and particularly for the large wooden type used in printing signs and posters.

Experiences with forest fires on the national forests this year show that automobiles, where they can be used, furnish the quickest and cheapest transportation for crews of fire fighters. Motor rates are higher than those for teams for the actual time employed, but the total cost per distance traveled and in wages paid to men in getting to fires is much less. The time-saving is self-evident; trips which ordinarily require two days' time by team have been made by automobile in a few hours.

Although there were an unusual number of forest fires on the national forests of Oregon and Washington this year, the loss of merchantable timber has been relatively small.

These are the lines of pores to look at with the hand lens.

WHITE OAK.—PORES IN SUMMERWOOD SMALL, INDISTINCT AND TOO MANY TO COUNT UNDER MAGNIFIER.

RED OR BLACK OAK.—PORES IN SUMMERWOOD LARGER, DISTINCT AND READILY COUNTED UNDER MAGNIFIER.

Wood Pipe as Water Conveyor

"How long will it last?" is a question asked perhaps more than any other concerning the use of wood pipe for irrigation. That the life of such wood pipe should be at least twenty years if the pipes are fully exposed and supported free from all contact with the soil, if the material is either fir or redwood, and if the pipe has been properly maintained, is the conclusion of a specialist of the United States Department of Agriculture in a professional paper on "Wood Pipe for Conveying Water for Irrigation" (Bulletin No. 155). Irrigation engineers and the owners of irrigation works will be particularly interested in this new pamphlet which may be had free of charge by applying to the Department of Agriculture, Washington, D. C.

Many millions of dollars are already invested in wood pipe lines in the United States and this amount is being increased annually. Protection of these investments demands that existing pipe lines be maintained and operated in accordance with what experience has shown to be the best practice. Future investments should also be safeguarded by designing, maintaining and locating new pipe lines according to the best known practices.

The length of life of wood pipe is dependent on the life of the wood rather than on the life of the bands, although contrary theories were held thirty years ago. Only in rare instances have the bands failed first. Corrosion of the bands being a chemical action requires the presence of moisture and oxygen. It usually occurs most rapidly where pipes are buried and the backfill is wet, under conditions which, as a rule, are most favorable for the life of the wood. Corrosion is greatly accelerated by the presence of alkali in the soil.

The decay of wood pipe is due primarily to the growth of fungi, though possibly certain forms of bacteria may assist in the final destruction of the wood cells. The growth of fungi to an extent detrimental to the life of the wood requires a favorable combination of moisture, air and heat. The exclusion of any one of these beyond certain limits inhibits their growth.

It follows that with pipes buried in the ground the wood will endure longest where the air is most nearly excluded, either by a high internal pressure which completely saturates it or by a deep covering of very fine soil. In accordance with the foregoing statement, experience shows that in contact with the soil wood pipe decays more rapidly under a light head than it does under heavy pressure, and other things being equal, it usually decays more rapidly in a porous open soil, such as sand or gravel, than it does in a fine soil of silt or clay, because the finer soil is more effective in excluding the air. Experience appears to indicate also that wood decays more rapidly in a loamy soil, rich in humus or partially decayed organic matter, than it does in one containing little or none. This is probably due to the fact that the presence of organic matter affords more favorable conditions for the development of fungus growths and bacteria.

Pipes fully exposed to the atmosphere and free from contact with the soil will, as a rule, be too dry on the exterior to favor the development of fungous spores, and so long as the outside of a pipe remains dry no appreciable decay will occur, even though the internal pressure is very light. Decay of exposed pipes almost invariably starts at the ends of staves, as a result of leaky joints. Where water leaks out and runs down over the outside of the pipe favorable conditions are afforded for the growth of the algae, which usually get a start, then mosses may begin to grow in the soil that collects on such spots, and decay spreads to adjoining staves. Bruising the staves in handling or injuring by too tight cinching of bands renders them more susceptible to infection by the spores of wood-destroying fungi, thus hastening decay. The life of exposed pipes may be prolonged by promptly stopping all leaks as they develop and by keeping the exterior dry. The decay of buried pipes has also in some instances been arrested by removing the covering and leaving them exposed.

The asphaltum or tar coating applied to machine-banded pipe,

while intended primarily as a protection against corrosion of the bands, doubtless helps also to some extent in preserving the wood. Until recently the practice has been to leave the ends of wooden sleeve couplings untreated. These couplings almost invariably decay long before the main pipe. This may indicate that infection by wood-destroying organisms starts principally where the coating is absent, though less perfect saturation of the wood in the sleeves may be the more largely responsible for the early decay, as it may be noted also that decay occurs at summits of pipe lines where air accumulates much sooner than at depressions.

The practice of coating continuous stave pipe has not been common, but in a considerable number of cases some treatment has been applied for the purpose of preserving the wood. There is wide difference of opinion as to the value of such treatment, and the effectiveness for the purpose intended may depend also greatly on what is used and how and when it is applied.

On exposed portions of new pipes the United States Reclamation Service has used a paint consisting of six pounds of red oxid mixed with one gallon of boiled linseed oil. One gallon of the paint was sufficient for two coats on 125 square feet of pipe. On top of the pipe where exposed to the sun and where water from leaky joints runs down over it this paint does not last long, much of it being gone in two years. Repainting while the pipe is in use is usually not practicable, because oil paint will not adhere readily to wet material. The use of paint on exposed pipes under ordinary conditions probably adds very little to their life.

The new bulletin which consists of thirty-seven pages, contains a number of figures and tables of practical use to irrigation engineers. Continuous stave pipe and machine banded pipe are described in great detail and many specific instances are given to show how long wood pipe may be expected to last under special conditions.

October Forest Products Exports

The October statistics of forest products exports show a decline of fifty per cent or more for most items, when compared with figures for the same month in 1913. The decline is not universal, however. Trade with some countries shows an increase. Canada's purchases of hewed and sawed timbers from us were slightly larger than for October last year, but the lumber trade with Canada fell off more than half. Mexico's import of square timber from the United States increased 600 per cent in the same period. That increase was doubtless due to improvement in domestic affairs in the southern republic. The Central American countries likewise increased their lumber purchases in the United States. Decline is to be noted in every South American country. During October last year Argentina imported our lumber to the value of \$597,307, and for the same month this year the purchases there totaled only \$85,359. The showing is still worse for Brazil. Its imports of lumber from the United States fell from \$200,252 to \$459. In Germany and Belgium imports completely ceased. France's imports fell off 98 per cent, and Holland imported from us only 10,000 feet against 7,542,000 in October last year. Our exports to China in the lumber line were nothing in October, while last year the October exports there were valued at \$89,351.

Following are the totals of our exports of forest products for October 1913 and 1914:

	Oct. 1913.	Oct. 1914.
Hewed and sawed timber	\$ 603,292	\$ 255,812
Lumber	5,268,767	1,867,532
Furniture	645,508	236,228
Agricultural implements	1,813,522	427,087
Carriages	42,189	11,401
Wagons	122,721	530,849

The item showing wagons tells the effect of the war on this article. The export of wagons to Europe in October this year was 14,000 per cent greater than for the same month last year.

Letters to a Millman's Salesman

BY ARTHUR M. JOHNSTON*

To William Smith, who is just sprouting his pin feathers as a lumber salesman.

Dear William:

Have just been looking over your expense sheet for the month and I want to congratulate you. For years I have been laying the flattering unction to my soul that I could spot a phoney item in an expense report and grab it like a terrier grabbing a rat, but I want to say to you that you came nearer putting one across on the old man than any salesman we have ever had. That cute little horse and buggy item so cosily tucked away in your expense to Bedford nearly got across. You are learning fast, my son, but I find that there are no lumber dealers in Lewisville and can, therefore, arrive at but one conclusion. Who is the girl and how long have you known her?

Now, William, that item gives me a severe pain under my wesco't. You are too young to be an artist at doctoring an expense report. Ask the other fellows how to do it. If my wife were not a member of the church I'd be tempted to say, fudge! The item has been charged back to you, and I hope you will learn that experience is the handmaiden of wisdom.

I read with interest what you say about Old Man Smithers at Jonesville. I know the old scoundrel. He has been conducting an alleged lumber yard in that town for years. His father died and left it to him, otherwise he wouldn't have it. If he has a four-inch strip and a bunch of shingles in the shed he thinks he is overstocked. Every time he tries to spend a nickel he gets a cramp in his hand.

I remember one time, several years ago, he hired a kid with his little express wagon to deliver a few bundles of lath. When the boy came back for his pay the old skinflint felt in all of his pockets, looked disappointed, hem'd and haw'd and finally said:

"Well, Johnnie, I surely thought I had a nickel but I guess I must have spent it."

"Mr. Smithers," said Johnnie, "if you ever had a nickel you've got it yet."

So he told you our service was rotten, did he? Well, you can tell him that his rating is in the same state of decomposition. If you sell him any lumber I'll fire you. We had him on our books once for three years and it cost us all the account was worth in dunning letters, sight drafts and other collection expenses.

I note what you say about business being poor. Now, William, when you have been in business as long as I have you will learn that business is just about what people think it is. Business, like happiness, is a state of mind. If people think business is poor, it is; if they think business is good, it is; but no salesman, who is worth his salt, ever allows himself to think on such a subject—he never allows a doubt to enter his mind. He *knows* business is good. He may permit himself to realize that it is a little harder to get business than usual, but he throws his lever two or three speeds ahead and hits the grit at a little livelier pace until he has the "quiet business" crowd behind him spitting dust.

It is his business to see that his customers do not get the "poor business" thought into their heads. Or, if they have the bug, already, it is up to him to get it out of their heads and get them to thinking good business. How can you expect buyers to think good business when there is a bunch of salesmen cavorting around the country handing them a bunch of deep ultramarine conversation. The dope handed out by these salesmen only confirms the buyer in his determination to buy more conservatively and demand longer dating on his orders. He in turn hands out the blue funk stuff to his customers and soon that entire community has the poor business bug.

The general public doesn't like to believe in hard times and they are the last to accept the situation. Reports of hard times never originate with the people; they always come from those higher up who should know better. Some of these, so-called, big business

men give me an acute distress in the epigastrium. However, the retailer depends on you fellows for real inside information on the business situation and, if you hand him the blue stuff, you have only yourself to blame if he doesn't give you any business.

When I was on the road I knew a salesman by the name of Sid Perkins. I suppose his first name was Sidney. It sounds like Clarence and smells of curly hair and a wrist watch, now doesn't it? But there was nothing of the sissy about Sidney—he was the real stuff. Sid had the gift of tongues. He could hand out a bunch of talk that would coax the birds right down out of the trees. I believe he could sell a ham sandwich to a wooden Indian. He had his faults, to be sure, but I have long ago forgiven him everything but his raiment. He sported a sartorial combination that was a scream. Like the Son of the Morning, his coming shone afar off. He used to wear a vest which looked like an old Dutch tulip bed and sounded like an American boiler shop. His hat and tie were constantly calling each other naughty names. He freely admitted that he was the handsomest man on the road. He had a brand of pulchritude and a line of conversational pyrotechnics which always made a killing among the waitresses. He was a genius at poker—at least the ten-cent variety. When Sid sat in a game it ceased to be a game of chance because no one else had any chance. On more than one occasion he has pushed me gently but firmly away from my expense money.

I want to pause right here, William, to warn you against the insidious wiles of the great national game. Draw poker has been defined as a game into which you put your money and your confidence and draw out your confidence. You have undoubtedly, ere this, risked some of your hard earned shekels in the festive jackpot because that seems to be part of a traveling man's education. A few hints from an old stager may help you to conserve at least a small part of your expense money. It hath been said in times past, "Put not your trust in princes," but I say unto you that it is better that you should lose all your shekels backing three kings than to fritter away your substance drawing to short pairs in every now-hatched, unfledged jackpot. If the fair Goddess of Fortune smiles not upon you, do not grow wroth and break out about the mouth and say "pooh! pooh!" If the pirate across the table draws two cards and fills a flush against your three aces, laugh like this, "Har! Har!" and console yourself with the thought that the Lord loveth a cheerful giver. Do not attempt to hold out cards up your sleeve or on your chair under the table. This is ungentlemanly and crude and discovery is apt to lead to a sudden termination of your joyous young life. Learn to slip them from the bottom of the deck with a sidewise motion of the third digit of your sinister extremity. Thus may your days be long in the land and your generation rise up and call you blessed.

Now, to return to this Sid person. As I said before, he could "speak with the tongues of men and of angels" when it came to talking lumber. He was a direct lineal descendant of Old Optimo himself and he had not a drop of pessimistic blood in his whole body. He had never learned that there was a hole in the doughnut. All his geese were swans and when he began to talk lumber the birds stopped to listen, the rain ceased and the sun came out. He certainly had a way with him. He could give his customers a dozen perfectly plausible schemes for selling more lumber in the future and a dozen good reasons why they had not sold more in the past. He left them torn between two emotions—remorse that they had not sold more lumber in the past and joy at the prospect of new business which they could see in the future. As for Sid, he would come away with some of the most wonderful orders and we all hated him—not because he got the business but because it gave him such a bad case of cerebral elephantiasis.

For him there was no such thing as poor business; he would not talk about it or permit any one else to talk to him about it. He lived on optimism, and fifteen minutes' conversation with him was

* Publicity manager for The Stearns Salt and Lumber Company, Ludington, Mich.

good as a shot in the arm any day. If ever a man had a mission this Sid. party had; his mission was to jolly the lumber trade and create in it a cheerful frame of mind.

Therefore, William, go thou and do likewise. Be a little sun-beam, William. The class of literature you have been firing at us lately is not calculated to make us whoop for joy. I don't like your literary style and the local color of your stories is not at all con-

vincing. Throw a little sand on your rails and go to it. If you don't send us any more excuses for not sending any business, I will promise not to make any excuses for not sending you your regular check.

Remember the old Latin maxim, *Soc et Tuum.*

Very truly yours,

JOHN MITCHELL.

Makes Hit in Furniture Trade

American black walnut, which has been coming to the front strongly during the past year or two, will be more prominent than ever at the January furniture shows, according to members of the walnut trade who have kept tab on the development of this phase of the situation. Instead of thirty-five manufacturers exhibiting, as was the case last July, there will be at least sixty-six separate exhibitions featuring walnut, and as the list was made up December 1, it is fair to assume that the number will be considerably increased by the time the shows actually open.

This striking demonstration of the fact that walnut is actually taking hold is significant in a number of ways. In the first place, it shows that the dealers want to stock up with furniture made of this material, because, while old, well established and one of the world-leaders in point of quality, it has, at this particular time, the advantage of novelty.

In the next place, it shows conclusively that manufacturers who were holding off and refusing to add walnut to their lines because they were afraid that the supply was not sufficient for the demands that might be made upon it have come to the conclusion that there is plenty of the wood. Publication of actual stock lists of the leading walnut houses, showing exactly what they have on hand, has demonstrated to the consuming trade that there is no need to be uneasy on this score, while government reports, indicating an annual production of over 50,000,000 feet of walnut lumber, back up the assertion that there is plenty of walnut for domestic factories.

The public is taking hold of the proposition in good style, reports from retail centers state. Aggressive merchants, having decided to stock up with walnut, have advertised the fact and have pointed out the quality of the wood and that it is of the sort which is suitable for "the next generation's heirlooms," as one Chicago concern put it. This clever exploitation of the possibilities of the wood has had its effect, and people are now buying walnut and starting to use it in their homes. This means that more furniture of this kind will be purchased, and also that walnut will be in great demand for interior finish, because as soon as a definite vogue in furniture-making is established architects and builders generally are wise enough to take note of it and to trim their structures accordingly.

An impressive number of leaders in the furniture trade is included in the list of houses which will show walnut next month, the tabulation thus far embracing the following:

AT GRAND RAPIDS

Atlas Furniture Company, Grand Rapids; Alt & Batsche Mfg. Company, Grand Rapids; Aulsbrook & Jones Furniture Company, Sturgis, Mich.; Berkey & Gay Furniture Company, Grand Rapids; Carrollton Furniture Company, Carrollton, Ky.; Criswell Furniture Company, Grand Rapids, Mich.; Grobbiser Cabinet Makers Companies, Sturgis, Mich.; Grand Rapids Furniture Company, Grand Rapids; Hawks Furniture Company, Goshen, Ind.; Jamestown Table Company, Jamestown, N. Y.; H. Lauter Company, Indianapolis, Ind.; Lincoln Chair Company, Columbus, Ind.; Marvel Furniture Company, Jamestown, N. Y.; Michigan Furniture Company, Ann Arbor, Mich.; Ottawa Furniture Company, Holland, Mich.; Orinoco Furniture Company, Columbus, Ind.; Phoenix Furniture Company, Grand Rapids, Mich.; Rushville Furniture Company, Rushville, Ind.; Star Furniture Company, Jamestown, N. Y.; Sligh Furniture Company, Grand Rapids, Mich.; Steinman & Meyer Furniture Company, Cincinnati, O.; Salamanca Furniture Works, Salamanca, N. Y.; Thompson Mfg. Company, Holland, Mich.; Udell Works, Indianapolis, Ind.; Western Furniture Company, Batesville, Ind.; Woodward Furniture Company, Owosso, Mich.; John Widdicomb Company, Grand Rapids, Mich.; West Michigan Furniture Company, Holland, Mich.

AT CHICAGO

Brookville Furniture Company, Brookville, Ind.; C. H. Campbell Furniture Company, Philadelphia, Pa.; Danziger Furniture Company, Shelbyville, Ind.; Hannab's Furniture Mfg. Company, Kenosha, Wis.; Louis Hanson Company, Chicago; Jobson Chair Company, Chicago; Karges Furniture Company, Evansville, Ind.; Stout Furniture Company, Salem, Ind.; Woodward Furniture Company, Owosso, Mich.; Ward Furniture Mfg. Company, Ft. Smith, Ark.; Wilson Furniture Company, Louisville, Ky.; White Furniture Company, Mebane, N. C.

AT NEW YORK

Star Furniture Company, Jamestown, N. Y.; Salamanca Furniture Works, Salamanca, N. Y.

MISCELLANEOUS PLACES

Keene Bros., London, Ont., Can.; Varner Furniture Company, St. Joseph, Mo.; Tickell & Sons Company, Belleville, Ont., Can.

LOCATION OF EXHIBIT NOT INDICATED

Addawagan Furniture Company, Grand Rapids, Mich.; American Cuckoo Clock Company, Philadelphia, Pa.; American Chair Mfg. Company, Hallstead, Pa.; Bania Furniture Company, Goshen, Ind.; L. C. & W. L. Cron Company, Piqua, O.; Estey Mfg. Company, Owosso, Mich.; Connersville Furniture Company, Connersville, Ind.; Imperial Furniture Company, Grand Rapids, Mich.; Johnson Furniture Company, Grand Rapids, Mich.; S. Karpen & Brothers, Chicago; Nelson Matter Company, Grand Rapids, Mich.; O'Mara Parlor Frame Company, Chicago; D. T. Thauwald Company, Cincinnati, O.; Union Furniture Company, Batesville, Ind.; Wisconsin Chair Company, Port Washington, Wis.; Wolverine Mfg. Company, Detroit, Mich.; Warren Furniture Company, Warren, Pa.; Widdicomb Furniture Company, Grand Rapids, Mich.

Asks Further Consideration of Tap Line Ruling

A letter has been sent to the Interstate Commerce Commission at Washington, D. C., by Luther M. Walter, a Chicago attorney representing lumber interests and freight matters, the purpose being to request from the commission a further expression of opinion concerning lumber rates in connection with tap lines. Mr. Walter asks, on behalf of his clients, that, in certain cases, the ruling that the rate shall be on lumber only from the point where the lumber is made to its destination, be modified in order to bear justly on all concerned. He cites a case, as an illustration of the point which he wishes to emphasize of a mill located at the junction of a tap line and a trunk line, but it receives its logs over the tap line. Under present arrangements the tap line receives no pro-rata on the lumber shipments because it does not carry any lumber after it is sawed, though it carries it all as logs before they are sawed.

Now, if the sawmill were located near the far end of the tap line, instead of at the junction, the tap line would be prorated for carrying the lumber. Mr. Walter points out that it would be but justice to allow the tap line some part of the freight on the logs, though the lumber is cut at the junction and he suggests that the freight should be prorated on the actual weight of lumber cut from the logs and shipped over the trunk line.

Mr. Walter presents that argument in view of a report or ruling by the Interstate Commerce Commission, dated July 29, 1914, which announced: "The rate on lumber at the junction or mill point may not lawfully be extended back to the point on the tap line where the logs originate, and any division out of the through lumber rate, on account of the log haul, cannot be sanctioned."

It is claimed that a strict adherence to the ruling will operate as discrimination against the mill at the junction point, and in favor of the mill some distance down the tap line.

Interesting Traffic Developments

Increased rates on logs from Stuttgart and other points in Arkansas to Memphis, Tenn., have been suspended until March 27. The proposed increase is a very decided one. The present rate to Memphis is six cents, which it is proposed to increase to eleven cents.

The case of the Bradley Timber and Railway Supply Company versus the Minnesota & International Railway Company, et al., has been dismissed. The commission found the rate of twenty-eight cents on lumber from Gimmill, Minn., to Red Ford, O., not to be unreasonable.

Reparation was awarded the John A. Cranston Lumber Company of Wilmington, Del. The defendant was the Atlantic Coast Line. The company refused to re-consign a carload of lumber, which caused the accumulation of demurrage.

The present rate on sawmill machinery from Beau, Col., to Louisiana points has been sustained by the commission, after consideration of the case brought by the Bean Iron Works.

A case of more than usual interest has been brought by the Snow Lumber Company of High Point, N. C., versus the Raleigh, Charlotte & Southern Railway. The lumber company asks for a reduction in rates from its mills at Ellerbe and Norman, N. C. The railroad company relies on a contract made with the lumber company, before the line was built, to sustain the high rates charged. The Ellerbe branch was built in 1910. It is 17½ miles long. It leaves the main branch at Candor. The line runs through unproductive country, it is claimed, and was built only on the understanding that the present rates on lumber were to be maintained.

Much interest was evidenced in the decision in the case of the Red Cedar Shingle Manufacturers' Association of Seattle versus the Minneapolis & St. Paul Railway Company. Demurrage had been assessed at destination on each of two cars into which a single car load shipment had been transferred en route. The commission decided that for the assessment of demurrage, the shipment should be recorded as one car shipment. This is important, owing to a number of similar cases. In the same case, reparation was awarded because the shingles, which comprised the shipment, were transferred into open cars. The cause of the demurrage was due to the damage done to the shingles by soot, cinders and weather, which caused the consignee to refuse the shipment. Despite the fact that the shingles previously had been placed in open storage, the commission found that the railroad was responsible.

Permission has been given the Louisville & Nashville Railroad to amend its tariff by the addition of the following note: "In the absence of special commodity rates, mixed carloads of two or more kinds of lumber, or articles taking lumber rates, will be taken at the highest rates provided for carload quantities. The carload minimum weight will be the highest carload minimum weight provided for any article in the shipment."

Charles K. Parry & Co., Philadelphia, has filed a complaint with the Interstate Commerce Commission protesting against a number of lumber rates being applied on the Southern Railway.

A complaint from the Anderson-Tully Company of Memphis, against the Chicago, Rock Island & Pacific Railway, attacks the twenty-three cent rate on box material from Arkansas points to Chicago. It is stated that the proper rate should be twenty cents.

A reparation claim, larger than the average, has been submitted to the commission by Theo. Kundtz of Cleveland. He claims that the Frisco lines have collected an unreasonable rate on more than 200 cars of hardwood logs. He asks for a refund of \$5,038.78.

Briefs have been submitted by each side in the case of Ferd Brenner Lumber Company of Alexandria, La., versus Morgan's Louisiana Railway & Steamship Company. The railroad claims that the case involves the question of making transit privileges retroactive. This is denied by the complainant. It is claimed that a discrimination existed as transit privileges were allowed movements of hardwood from Eola and Cheneyville at the same time.

Hearings for January have been announced as follows by the commission: Chattanooga, January 9, Chattanooga log rate cases,

Examiner Watkins; January 11, Maley & Weitz versus Louisville & Nashville (two cases), Nashville Tie Company versus Louisville & Nashville, and two cases of the Nashville Lumbermen's Club.

Louisville, January 18 and 19, rates on lumber from southern to Ohio river crossings and other points, Examiner Watkins. These hearings will be a continuation of hearings which will be begun at Memphis, January 13.

Reinforcing Poles With Concrete

It is now a fairly common thing to find poles strengthened at the ground line by a reinforced concrete sleeve. The Union Traction Company of Indiana has reinforced the trolley poles along many miles of its track and after five years' experience reports that the results are apparently very satisfactory.

The greatest test of a pole is at or near the ground line, as it is here that the conditions are most favorable for decay. Any untreated pole contains a considerable amount of sapwood, and when this is destroyed the cross-sectional area and consequently the strength of the pole is very seriously reduced. The object of the concrete sleeve is to reinforce the pole at this point of greatest weakness. The traction company has made tests of this reinforcement and has demonstrated that a pole cut entirely off at the place where it usually rots can be restored to its original strength.

The form or mould is made in two semi-cylindrical halves of black sheet iron stiffened with three bands on each half. The form is hinged in the middle to permit ready closing about the pole and removal. The diameter of the form varies from eighteen to twenty-four inches, according to the size of pole to be reinforced; the length is forty-eight inches.

A hole is dug about the pole to a depth of a little more than two feet. All of the rotten portion of the pole is carefully shaved off and the exposed wood painted with a heavy coat of creosote. The form is then placed in position extending above the ground about twenty or twenty-two inches.

The reinforcement used by the Union Traction Company of Indiana consists of a 12-bar fence woven by the Dwigging's Fire Fence Company. The top and bottom bars are of No. 7 wire, intermediate bars of No. 9 wire. The vertical bars are of No. 9 wire woven three inches apart. This fencing is cut into lengths to fit about the pole inside the form. The cost is about thirty cents per pole.

The concrete is made of one part cement to five parts gravel and sand.

The average cost of reinforcing the poles of this traction company has been about two dollars per pole.

The propellers of aeroplanes such as are used in the present European war may be made of selected ash, which is both strong and light and will not split under vibration or shock, or of built-up layers of spruce with mahogany centers. The framework of the machines, too, is generally made of wood, spruce being much used on account of its straight grain and freedom from hidden defects.

A surprisingly large number of substances, ranging all the way from the condensed fumes of smelters to the skimmed milk of creameries, have been tried or suggested as means of preserving wood from decay. Most of them, however, have been found to have little or no value for the purpose. Certain forms of coal-tar creosote and zinc chloride are the most widely used wood preservatives.

It is said that the German invaders of Belgium, whatever else they may have destroyed, have been careful not to injure park trees. The cavalymen, so a report goes, are forbidden to tie their horses to trees for fear that the animals will gnaw the bark. Germany was the first nation to apply forestry on a large scale, some of the crown forests having been under scientific management for over a hundred years.

J. E. RHODES, CHICAGO, CHAIRMAN OF THE PRELIMINARY MEETING

JULIUS SEIDEL, ST. LOUIS, MO., MEMBER ORGANIZATION COMMITTEE

J. R. MOOREHEAD, KANSAS CITY, MO., MEMBER ORGANIZATION COMMITTEE

Lumber Merchandizing Ideas

About sixty men prominently and directly connected with the manufacture and merchandizing of lumber met at the Hotel LaSalle, Chicago, on Thursday, December 17, for a preliminary conference, the purpose of which was the launching, along concrete and definitely specified lines, of a campaign to meet the issue presented by the encroachments of so-called substitutes of wood in many lines. The purpose of the meeting was fully realized, and such a movement has been started on a basis which practically insures accomplishment with the complete moral and financial support of every one interested.

On motion J. E. Rhodes, Chicago, secretary and manager of the National Lumber Manufacturers' Association, was elected chairman, and Adolph Pfund of Milwaukee, Wis., secretary of the Wisconsin Retail Lumber Dealers' Association, was elected secretary.

The theme of the meeting was clearly set forth in a very able introductory address by Mr. Rhodes, topics to come up for consideration being:

Building codes.

Comparison of cost of lumber and competitive materials.

Investigation as to the comparative value of frame construction and competitive construction for fire resistance, and the creation of a fair impression of the public's mind on this question.

Investigation as to expenditure and methods of advertising competitive materials.

Determination of such places and conditions under which lumber as a construction material is not desirable.

Definite plans for limiting the activity of the enemies of wooden shingles, showing exactly where the wooden shingle can be used safely and where it should not be used.

Educational campaign tending to give the general public definite information as to the utility of wood.

The formation of a committee to draw up a definite plan of advertising to put the movement on a broad basis.

The establishment of a definite means of raising funds by assessment of associations according to size.

Dr. Herman Von Schrenck of St. Louis, consulting engineer of the National Lumber Manufacturers' Association, said that the question of specific fitness is now uppermost. He said that lumber is sold too much as a raw material and is not refined to a sufficient degree to make it a commodity marketable along the lines of modern merchandising. He maintained that the only successful way of promoting the utilization of wood is honest statements showing just where it should be used and just where it should not be used. He cited as an illustration supporting this contention the action of salesmen at the cement shows. These men are busily engaged in ex-

plaining the cause of failures in concrete construction. They do not attempt to deny that failures exist, but attempt to show with scientific data they have at hand just why these failures occur and how they are traced to defective workmanship.

He cited three defects which admittedly stand against wood construction, namely, that it is not strong enough for certain uses, that it eventually decays and that it burns, maintaining that the biggest problem is to establish the proper utilization of wood so that it will not be put to uses which lead up to these results. He said that the future use of wood depends upon its strength, or rather upon putting it on such a basis that definite quantities of wood can be assigned to a certain task; upon its cost and upon its fire resistance. He presented charts which he had presented before a recent meeting of the Western Society of Engineers in Chicago showing that for certain purposes wood construction is actually cheaper and just as effective as concrete or steel. Dr. Von Schrenck cited the action of cypress manufacturers as showing the unwisdom of claiming for wood qualities which it does not possess. He said that this association has come out definitely against the use of shingles in congested districts, but on the other hand demands that they should be given a fair trial in districts where congestion does not occur. Fire limits should be based on scientific knowledge.

He maintained that a fire resistant wood must be ultimately worked out and said that lumber has a proper function to fulfill, but that the only way to push the markets of lumber to a successful degree is to talk specifically and without excessive claims. He maintained that lumber has enough good qualities to make extravagant claims and misstatements entirely unnecessary.

THE CITY RETAILER

Julius Seidel of St. Louis said that the great trouble with lumbermen is that they are paying too much attention to competition for individual orders and are not giving enough thought to broader phases of the business, which will develop more trade for all. He said the trouble is that no one really wants to pay the money. He came out strongly and definitely for what he aptly termed a pure food law for lumber, which according to his explanation means that lumber should be so manufactured and marketed that anybody buying lumber anywhere will know that he is getting exactly what he wants and that he is paying a price really commensurate with the value of that particular kind of lumber. He cited specific cases in which certain inferior woods are mixed with superior species, the result being

GORDON C. EDWARDS, OTTAWA, ONT. MEMBER ORGANIZATION COMMITTEE

L. W. CROW, CHICAGO, ILL. MEMBER ORGANIZATION COMMITTEE

R. H. DOWNMAN, NEW ORLEANS, LA., MEMBER ORGANIZATION COMMITTEE

that in many cases the inferior wood will not live up to what is demanded of it in certain uses where the superior wood is specified, and where the task is apportioned according to the qualities of the superior wood which it had been expected would be used. He said that this method hurts the trade as a whole and does a great deal toward putting lumber in a position which it cannot afford to hold.

Mr. Seidel cited a case, which is probably typical of a great many in every part of the country, having to do with the building code of St. Louis. This code allows the figuring in structures of concrete construction of 100 pounds to the square inch, but the old code for lumber, which was in existence long before this addition covering concrete construction was put in effect, specified the figuring on the basis of 150 pounds to the square inch. Mr. Seidel maintained that this is a striking illustration of the indifference of lumbermen to conditions which are directly derogatory to their industry.

Chairman Rhodes called on L. W. Crow, president of the Lumbermen's Association of Chicago, to describe proposed ordinances which are coming up before the Chicago council to broaden the fire limits, these being aimed at eventually stretching the limits to the city lines. The lumbermen, according to Mr. Crow, are starting to make people back of this movement give good reasons why this ruling should be put into effect. He expressed as his opinion that the substitute people are actively behind this proposition, although not entirely responsible. He said that the Chicago lumbermen are willing to admit the justice of certain claims that are not favorable to wood, and that the greatest difficulty he and his associates have encountered is to exactly determine the force behind this opposition to wood in order that the issue may be approached on definite and specific lines. He said that Chicago lumbermen are looking to the manufacturers to outline plans that can be followed and the duties of all under such plans, and announced that Chicago lumbermen are ready to help in any legitimate line of lumber advertising.

F. A. Hofheims of North Tonawanda, N. Y., who has been carrying on quite extensive work along the lines suggested for consideration by the gathering, was next called upon. Mr. Hofheims instanced a case which is now coming up in the state of Massachusetts, prohibiting the use of shingles anywhere in that state. He maintained this would be a tremendous calamity to the lumber business as it would establish a precedent that would spread rapidly over the country. He demanded that immediate action be taken on this particular case and said he would either continue to carry out the work he has already planned toward this end, or would turn over his assistance to this new movement with what funds he has already raised for combating this wood agitation.

The meeting then adjourned for luncheon.

Afternoon Session

Chairman Rhodes opened the afternoon session with a reiteration

of his belief in the co-operation of all branches of the lumber business. He said that before calling for further discussion he would outline the two prime objects before the meeting, namely the formation of a definite plan of organization in order that associations can co-operate with the general association, and the appointment of a committee to work up the program.

L. L. Barth of the Edward Hines Lumber Company, Chicago, suggested that the chair appoint a committee of seven to work up these ideas in concrete shape and report them back to the meeting so that definite action could be taken. The chairman appointed on this committee W. A. Gilchrist, F. A. Hofheims, A. T. Gerrans, J. R. Moorehead, Adolph Pfund, E. F. Perry and L. L. Barth. This committee retired for consultation.

THE COUNTRY RETAILER'S VIEWPOINT

J. V. O'Brien, secretary of the Cleveland Board of Lumber Dealers, Cleveland, O., told of the formation of a Cleveland organization entitled "Society Advocating Fire Elimination," which he maintained is simply a campaign for brick and other competitors of wood in construction work. He said this organization has been able to make remarkable strides as its members have always been active advertisers in the Cleveland press, whereas lumbermen have not, and hence the public sentiment has been turned favorably to the organization. He said that lumbermen have awakened to the situation and are now endeavoring to offset its effect as much as possible by the use of placarded wagons with the following placard, "Build With Lumber. It Is More Beautiful, Costs Less." According to Mr. O'Brien, the chief difficulty the lumbermen have encountered is the fact that they find themselves without specific and definite arguments to combat the arguments of wood substitute handlers, and that in his opinion this is the chief difficulty in the way of any such general campaign. He said that the city of Cleveland is now working on a new building code and that at no time has a lumberman ever served on the building code committee. He said that without definite information it is almost impossible to successfully argue lumber before this body. Mr. O'Brien stated that the opinion of the Cleveland lumbermen is that there should be a definite national bureau to work out this question, and that local organization should absorb local cost.

J. W. Barry of Cedar Rapids, Iowa, was the next speaker. Mr. Barry expressed himself very forcibly in opposition to past methods of lumber advertising, saying that there has been too much boosting of individual woods and no advertising or educational work regarding lumber in general. He said that retailers can join such a movement as is aimed at if "wood" will be advertised rather than any specific wood. He expressed himself as believing that the cost of advertising should be paid from the selling price and that this is the only logical way of settling that question. Mr. Barry outlined one case in which wood is suffering because of the carelessness on the part of manufac-

turers, namely the too general custom of manufacturing building lumber too thin. He said that this question probably does not appear serious to the manufacturer, but to the retailer who is on the firing line and can see the effect, it does present a serious condition and that retailers are constantly having to concoct arguments to offset dissatisfaction with thin stock. Mr. Barry maintained that the argument that lumber is manufactured thin because it saves cost in raw material will not hold inasmuch as the average structure is figured to carry a certain load with a certain sized joist, and when the joist is manufactured scant it simply means that more joists have to be put in to accomplish the same work. Mr. Barry maintained that the retail lumberman should carry so-called substitutes because he is best qualified to judge when those substitutes are applicable and when lumber would be preferable. He maintained that if lumbermen do not carry them the hardware man and others will. The result would be that hardware men would push substitutes in all cases, whereas the lumberman would naturally push wood unless he knew substitutes served the case better, which would be a rather isolated case.

Mr. Rainey of Columbus, Iowa, cited experiences during his thirty years in the country retail business. He said he believes manufacturers are to blame in the main for present conditions in the lumber business and that the lumberman's chief object seems to be striving to cut prices below a figure set by his competitor without intending to give full value received for the money. Mr. Rainey maintained that he and the average retailer would much prefer to get value received at a higher figure. He maintained that there should be a specific ruling in effect definitely determining exact thicknesses to which lumber should be cut, and he supported Mr. Barry in this contention. Mr. Rainey maintained that all retail lumbermen should inform themselves as to the adaptability of different woods for specific purposes so that they will be able to give their customers intelligent advice. Mr. Rainey also claimed that if the retail yardman must protect his stock by carrying substitutes he is not necessarily an advocate of such goods.

C. H. Kittridge spoke as did the others regarding the individualization of the lumber business. He compared the lumber business with three drops of water on oiled paper. While they remain inactive and undisturbed they are distinct and far apart, but as soon as they come into contact they immediately fuse with one another. This, he said, illustrates what is now taking place as a result of this general controversy in the lumber business. He said that the lumbermen as a whole have not realized that we have a new generation with new ideas to contend with, and that this new generation has been educated to consider wood substitutes as a superior article, and lumber as secondary in building construction. Mr. Kittridge maintained that it will take just as long to get people back to the general use of lumber as it took to divorce them from their former practices in this direction. He said that he believes a system of advertising that will create a desire for lumber will be successful, and that the reason retailers handle substitutes is because advertising has created a demand for substitutes and they must meet this demand in order to protect their trade. Mr. Kittridge seconded the suggestion of former speakers regarding lumber which is manufactured too thin, saying that the consumer has wanted thick lumber but has been made to take thin stock simply because the lumberman wanted him to. He advocated a campaign on the proper using of lumber among retailers and contractors.

SCIENTIFIC STUDY OF LUMBER PROBLEMS

Howard F. Weiss, director of the Forest Products Laboratory, Madison, Wis., was called upon by Chairman Rhodes and gave an interesting talk on certain experiments which are being made at the laboratory looking toward the protection of wooden beams from fire. Mr. Weiss said there is no logical reason why wood should not be given just as fair trial in this particular as is concrete and steel construction. He said everywhere building codes specify that steel and concrete must be given a certain fireproofing but that wood is not accorded this advantage.

The Forest Service has hence been working on experiments looking to the additional fire resistant quality of lumber so protected. Ex-

periments were conducted with a beam with a twelve-foot span with a load of 1,800 pounds. This was then subjected to heat with a gas torch to 1,400 degrees F. Mr. Weiss said that the temperature in the average burning building is 1,700 degrees F.

Notes were then made as to the time it took to cause failure and tests were made with beams properly prepared, showing lengthening of this time.

The fire-proofing consisted of asbestos or sheet metal coating placed with an air space between the beam and coating, and fastened on strips. The experiment showed that the beam with no covering took seventeen minutes and thirty seconds to fail; the beam, with tin covering took thirty-eight minutes and fifteen seconds to fail with one half inch space between the tin and beam, and the beam with the asbestos covering took forty-six minutes to fail with the same space between the covering and the wood.

He said that experiments along certain other lines, which he is not at liberty to elaborate upon, showed an increase in time of over 300 per cent with the possibility of raising this to 400 or 500 per cent additional fire-proofing qualities.

Mr. Weiss said that in his opinion chemicals will not solve the problem of fire-proofing, as they transmit heat and cause charring, which is as undesirable as complete combustion.

He said further that the laboratory is going to test steel beams in the same way and compare their action with those of wood. He said they will test a beam set in a brick wall and are going to determine the action of each, showing the results of the application of large quantities of water when the beams are heated to the limit.

Referring to the experiment in fireproofing shingles with paint, he said they have not been successful as yet, and that it probably would be necessary to paint the entire shingle. Mr. Kittridge interrupted the speaker with the suggestion that what lumbermen want is a prepared shingle that will be prepared at the mill ready for shipment at a reasonable figure.

INSURANCE INTERESTS ANTAGONISTIC TO LUMBER

George Holt of Chicago spoke on the great harm which has been done to the lumber industry by organizations of insurance men who, without any data whatever that is of a reliable character, have done a great deal, in many ways, to injure the lumber business. He maintained that the privilege of insurance men to make their own conditions and terms of sale of their contracts works a great hardship. He referred to the report of Judge Potts of Illinois on this subject, which report was rendered to Governor Dunne. He said that wood manufacturing institutions in this country are among the most profitable risks that insurance companies handle, but that insurance people seemingly endeavor to penalize lumber wherever possible without having a vestige of definite claims supporting such effort. Mr. Holt advocated that the organization when completed meet with the Insurance Federation in order to work out the question.

He stated that if the members would place their insurance jointly the question could be settled over night.

Mr. Holt gave as an instance of the fallacy of arguments against wooden construction as a menace to city building actual data prepared from fire records in Chicago in which it was shown that out of 1,368 fires in Chicago in 1913 only three spread to the adjoining building and only one to more than one building, and that the bulk of these fires, numerically speaking, occurred in just that type of construction and in just those sections in which the agitation against wood for building purposes is most active.

THE ORGANIZATION PLAN

The committee came into the room after having been out for several hours and Chairman Rhodes called upon it to report. Mr. Barth reported in place of Chairman Gilechrist, and presented three recommendations which showed the findings of the committee as follows:

1—That a general mass meeting be called representative of all associations and all branches of the lumber and allied interests to be held at Chicago, and that an organization be effected to be known as the Forest Products Federation, the purpose of which is to be the education of the general public as to the proper uses of lumber and forest products.

2—That a committee of five be appointed to prepare a program to have power to appoint a secretary and sub-committees and prepare information and data for the general meeting; this committee also to have power to invite prominent speakers to attend and address the mass meeting; that the

sub-committees be appointed for the purpose of appearing before retail associations before the date of the mass meeting in order to work up sufficient interest in that field.

3—That a committee of three be appointed by the chair for the purpose of raising funds for the committee's immediate use, estimated to be about \$2,000, to take care of the launching of the mass meeting, and that this committee have power to collect and distribute such money.

Mr. Barth moved the adoption of the recommendations, which motion was duly carried.

There followed considerable discussion on the various recommendations. The date for the mass meeting was finally set for February 24-25, same to be held in Chicago.

BUILDING CODE EXPERT TALKS

A. W. Herbst, director of safety of the American Society for Fire Prevention of New York, then addressed the meeting. Mr. Herbst said that in the two years prior to 1914 he was in charge of writing the new New York City building code. Mr. Herbst stated that most of the agitation against wood is launched by so-called uplift societies which, as he described them, are made up of incompetents who are not capable of following any definite line of business and go into such work merely because of its elastic character. He said that representatives of such a body approached his committee when it was forming the New York law and protested against the use of wood in city construction. In fact they went so far as to prepare papers and elaborate arguments against the use of anything that would burn. He asked what could be expected of a legislator who must follow the ruling of the majority. He said that in accord with those ideas the committee recommended prohibiting the use of wood in buildings of over 100 feet high, which would have meant a ninety per cent reduction in the use of wood in New York City. This was followed by a great protest which resulted in an investigation by the board, which investigation developed that the agitation was not wholly on the part of the trades interested in manufacture of competitive materials to wood, but that real estate men who were financially interested in tall buildings were as much to blame as they figured that by restricting the height of buildings the value of their own structures may be made even greater.

He stated that the lumbermen's cause was presented weakly because instead of the lumber trade being represented as a whole, individuals came to protest, and for this reason the committee was constantly skeptical regarding the arguments presented, figuring that these arguments might very well be based on desire for mere aggrandizement on the part of lumbermen.

The society with which Mr. Herbst is now identified was formed as he described it, for the purpose of giving fair consideration and providing fair play for all. He deplored the arbitrary attitude of the insurance people. Speaking of shingles, Mr. Herbst said that the agitation against that type of roofing has become general because people as a whole feel that because a piece of wood will burn when it is put into a fire all wood is dangerous. In closing Mr. Herbst came out very emphatically regarding the lumbermen's cause and expressed his opinion of what they are up against when he said "don't wait until you are kicked. If you start this thing, keep always at it and don't try to approach the question singly. You will get a square deal in New York."

W. W. Knight of Indianapolis, Ind., first vice-president of the National Wholesale Lumber Dealers' Association, maintained that lumbermen are up against peculiar economic conditions. He deplored the tendency to fight the advocates of wood and to belittle legitimate competition.

Chairman Rhodes expressed himself as being entirely satisfied with the results of the discussions and what had been accomplished.

Herman H. Hettler of Chicago advised the lumbermen to get on the affirmative side, as he expressed it, if possible. He said the lumbermen pay much higher premiums for insurance than is justified because everybody is inclined to believe that wood is the cause of all fire losses whereas actual records show that losses have been far greater in concrete building.

Geo. E. Watson, secretary of the Southern Cypress Manufacturers' Association, New Orleans, spoke on the question of advertising, saying that he wanted to prepare the minds of those attending for

future consideration as to the cost of the work outlined. He said that he believed the manufacturers expect to absorb most of the cost, but that he would look to the retailers to use their influence on the manufacturers to bring them in line on the work.

W. B. Greeley, assistant United States forester, Washington, D. C., said that the Forest Service, of course, could not take any partisan position in the controversy, but is vitally interested in seeing lumber being developed along logical, educational lines. He stated the Forest Service's attention is directed toward securing from trees a great money value, and that its ultimate aim is to make it pay to grow trees.

Chairman Rhodes then announced the committee of five, which was recommended by previously appointed committee, as follows: R. H. Downman, New Orleans, La., president National Lumber Manufacturers' Association; Gordon C. Edwards, Ottawa, Ont., president National Wholesale Lumber Dealers' Association; L. W. Crow, Chicago, president Lumbermen's Association of Chicago; Julius Seidel, St. Louis, Mo., J. R. Moorehead, Kansas City, Mo., secretary Southwestern Lumbermen's Association.

Following the appointment of this committee the meeting adjourned.

Increased Rate Allowed

The Interstate Commerce Commission has granted the five per cent increase in freight rates to the eastern railroads. The result will affect about sixty-four thousand miles of lines north of the Ohio and Potomac rivers and east of the Mississippi, and will increase their revenues from \$20,000,000 to \$30,000,000 per year. Coal, coke and ores are not included in the advance, but practically all other commodities are. More than one hundred railroad companies will profit by the increase in rates. Rail-lake traffic is not affected.

The railroads in the designated territory have been granted practically what they asked. A few items fall short, but in the main the railroads have won the victory for which they have put up a long and determined fight. Their increased revenue will come out of the pockets of shippers. If the matter ended there it would be a plain case of robbing Peter to pay Paul; that is, it would be taking money out of the pockets of shippers and consumers and putting it in the treasuries of the railroads. Solemn promises, however, have been made by the railroads that the increased money going into their treasuries shall not be absorbed in paying increased dividends, but that it shall be expended in buying materials, making improvements and in financing present and future business. That promise has reconciled the public generally to the increase. Shippers will pay without protest, provided the railroads fulfill their promises in good faith; but the bargain must be carried out in full if the public is to receive its share of the benefits.

The lumber interests of the country will pay a large share of the increased freights. They have a right to expect returns in the form of orders for cross-ties, bridge timber, trestle stock, lumber for platforms, stations, fences along rights of way, molds or casing for concrete work, scaffolds and numerous other bills of lumber. Other returns are expected to come indirectly. More metal for rails will be needed, more machinery, cars, locomotives and general supplies, and money must be expended for their manufacture, and when money is put in circulation some of it will find its way to the lumber camps, saw mills and woodworking factories.

The railroads have claimed that the allowance of the increased rate will make easy the borrowing of money in large amounts to carry out improvements. If their hopes in that direction materialize a great deal more money will be put in circulation than will be provided by increased rates alone. That is the greatest promise which the railroads hold out to the public. It means that for every dollar paid to railroads as increased freight they will be able to spend ten dollars in purchases and labor. Evidently the Interstate Commerce Commission was influenced by that argument when the decision was reached to grant the increase. The same argument will hold for the western roads, and their application for increased rates is already before the commission, and it is considered probable that it will be allowed.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 837—A London Firm Interested in Importing Stock

HARDWOOD RECORD is in receipt of the following postal from a representative of an English firm, who is on his way to this country to take up stock for his company:

London, E. C., Dec. —: Editor HARDWOOD RECORD: The undersigned is now in this country on a business trip. We require for export shipment in dry condition the lumber mentioned below, and will be pleased to have you quote us your lowest price, quality and quantity, and how soon shipment can be made. We prefer C. I. F. quotation England, but if F. O. B. is quoted, kindly give us the inland and ocean freight rates.

The following stock is wanted:

Walnut, all grades, 1½" and up thick; whitewood, all grades, ¾" and up thick, dressed and rough; plain oak, all grades, ¾" and up thick; quartered oak, all grades, ¾" to 2" thick; red gum, firsts and seconds and No. 1 common, 1" thick; sap gum in the same grades and thickness; mahogany, 1" and up thick.

B 838—English Firm Wants to Buy American Hardwoods

HARDWOOD RECORD is in receipt of the following communication forwarded to this office by an American manufacturer, the letter having been sent to that firm by a prominent Liverpool firm of timber brokers:

Liverpool, Nov. 27. Editor HARDWOOD RECORD: We have the following inquiry for northern woods:

Prime quartered white oak: ½" and ¾"x6" and wider, carload lots in equal quantities, 1"x6" and up in carload lots, 1½", 1½" and 2" mixed carload lots; prime plain oak, ½" and ¾" mixed carload lots, 8" and up, 1"x8" and up, carload lots, 1½", 1½" and 2", 8" and up in carload lots; caryory whitewood, medium qualities, ¾" and 1½" in carload lots, ¾" and 1½" in carload lots, all planed both sides.

Will you kindly quote us your lowest prices C. I. F. Liverpool, for any of the items you are in a position to ship?

The address of this inquiry will be supplied to those interested upon request addressed to this office.—EDITOR.

B 839—Wants to Get in Touch with Oak Stave Manufacturers With a View of Placing Export Orders

Cincinnati, Dec. 11. Editor HARDWOOD RECORD: We shall be obliged if you will advise us by return mail the names of some reliable manufacturers of oak staves, as we have several inquiries for this stock for export, and would like to get in touch with people who are making it.

Interested parties can have the necessary information by writing HARDWOOD RECORD.—EDITOR.

B 840—Has a Good Proposition to Offer Wheel Manufacturers

Lawrenceburg, Tenn., Dec. 3.—Editor HARDWOOD RECORD: I am in and near a territory which has much hickory timber suitable for rims and spokes. The quality is as good as any in this state, and it can be bought at bargain prices, because but little has ever been worked and there has consequently been only a limited demand for it.

I wish you would put me in communication with some reliable wheel and automobile concerns that might be interested in buying a quantity of this timber and working it up.

I am not the agent of any timber owners, but am a practical lumberman with twenty years' experience covering every detail from stump to ear, and would be willing to put my skill and time against necessary capital on satisfactory terms, and buy and manufacture spokes and rims.

By getting on the "ground floor" a steady supply of large volume could be had covering many years.

Anyone wishing this correspondent's address will be given same upon request.—EDITOR.

B 841—Wants to Market Hardwood Lath

Merrill, Wis., Dec. 9.—Editor HARDWOOD RECORD: We are seeking a further market for hardwood lath manufactured ½"x1½"x4' long, and consisting principally of birch, elm and maple. We have shipped a large quantity of this stock this year, but wish to extend our field, so if you know of anybody who would be interested and would care to mention it in your journal, would be glad to have you do so.

This company HARDWOOD RECORD knows to be in a position to manufacture a good line of stock, and to ship with good service and according to specifications.

Interested dealers can have the name on writing HARDWOOD RECORD.—EDITOR.

B 842—Wants to Buy Hornbeam Lumber

HARDWOOD RECORD is in receipt of the following communication from a prominent piano manufacturing firm for the stock named. It will be remembered that hornbeam is identical with ironwood and is pretty widely distributed throughout the country. It is cut in both the North and the South. Parties in a position to get out this stock regularly can no doubt make an excellent connection for same with this company.—EDITOR.

Cincinnati, O., Dec. 11. Editor HARDWOOD RECORD: We have had some difficulty in finding a mill or source of supply for hornbeam lumber and feel you might be in a position to give us this information. Kindly put us in touch with any mill or agent who either manufactures or handles this species of lumber. We are contemplating using it in the manufacture of our piano actions and if we can obtain the correct price would use a considerable amount yearly.

If you can give us any information along this line, please do so.

B 843—Wants to Buy Planing Mill Sawdust in Carloads from Pittsburgh District

New York, Dec. 11.—Editor HARDWOOD RECORD: Do you know of any planing mill in the Pittsburgh district which could get out sawdust in carload lots and deliver it at Pittsburgh rate of freight at \$10.50 a ton? Band mill sawdust is not quite fine enough, as we want to get a sawdust that will go through a mesh ranging from 28 to 40 to the inch. Any information you can give us on this will be greatly appreciated. We could probably give an order for shipment at the rate of two carloads a month.

This inquiry comes from a high class concern in New York City, and Pittsburgh planing mills in a position to fill the order would unquestionably find the deal a profitable one.—EDITOR.

Clubs and Associations

Executive Committee National Wholesalers Meets in New York

The executive committee of the National Wholesale Lumber Dealers' Association met at 66 Broadway on December 10. Routine matters were taken up and the fight against substitutes for lumber was also thoroughly discussed. W. W. Knight, first vice-president and Secretary Perry were made delegates to represent the wholesale association at the Chicago meeting December 17. F. R. Babcock and C. H. Prescott were named as delegates representing the wholesalers at the annual meeting of the Chamber of Commerce of the United States.

Buffalo Men Seek Restoration of Transit Privilege

President A. W. Kreinleder of the Buffalo Lumber Exchange, with M. M. Wall, O. E. Yeager, H. F. Taylor and H. L. Abbott, went to Washington to attend an important hearing on the transit question before the Interstate Commerce Commission on December 18. The hearing was in connection with the action brought by the Lumber Exchange and Chamber of Commerce against a large number of railroads. The case is of great importance to the hardwood trade which is chiefly interested in the restoration of the transit privilege to this market. At present the local yards are handicapped by rates requiring them to meet an additional expense of from one to nine cents per one hundred pounds. It is a difficult matter to do business at points east of Buffalo in competition with dealers at points of origin shipping over southern and western lines. A large array of facts has been gathered by the hardwood men during several months past.

"Made in U. S. A." Exposition

The "Made in the U. S. A." industrial exposition to be held in the Grand Central Palace, New York, March 6 to 13, will embrace a complete and diversified exhibition and demonstration of "American made" goods and "American grown" products in practically all fields.

Many leading manufacturers and merchants have declared that the most effective and valuable manner in which to show foreign and domestic trade buyers and also the general public, or consumer, the actual offerings of this country is the exhibition and actual demonstration as provided by an exposition, and this show is scheduled for a time of year when New York City is the mecca of buyers in many important fields from all sections of the United States and Canada.

Special campaigns will be conducted to augment the number of buyers visiting the city this year at the time of the exposition. These campaigns will include the work of several important export and other organizations to bring foreign buyers from South America and other countries.

The exposition will be held under the auspices of a committee of lead-

ing manufacturers and merchants and its management is in the hands of Harry A. Cochrane, with executive offices in the Fifth Avenue building, New York. Mr. Cochrane has been selected in view of his previous successes in trade show and industrial exposition organization and management.

The "Made in the U. S. A." industrial exposition is designed to answer a two-fold purpose. It is not only to stimulate American trade to domestic and foreign buyers but to educate the American consuming public to our resources and show, particularly, goods that can be obtained from our manufacturers that the American people themselves have heretofore been obtaining from abroad.

Baltimore Exchange Holds Annual

The annual meeting of the Baltimore Lumber Exchange which took place December 7 at the Merchant's Club, was not only one of the most enjoyable, but it may be doubted if any previous occasion of a similar nature has brought out such a large attendance. Covers were laid for about one hundred persons and the arrangements proved inadequate, additional tables having to be set to accommodate all those present.

Mr. Merryman, the retiring president, in his annual report, said in part:

The export trade for 1914 has been disappointing in nearly every way. The open winter permitted heavy shipments during a time when operations are supposed to be restricted, and with heavy stocks carried over from 1913 values ruled low. Especially cabinet woods, such as prime oak, quartered oak and high-grade poplar, were much depressed in valuation. Walnut logs were particularly depressed on account of large shipments abroad, and it was well known that Hamburg carried about 14,000 American logs unsold, and other centers on the continent were well stocked. It is not surprising that our export trade had not much prospect for this year under the above conditions.

The hostilities between the leading commercial nations of Europe plunged the trade in such unusual and uncontrollable conditions that for three months business was at a standstill in this country regarding exports. In addition to troubles abroad, the railroad authorities here placed an embargo on all foreign shipments, which completely blocked business in the interior. Many European cargoes of lumber for the continent were diverted to the United Kingdom, and in consequence the British markets are much oversupplied. There is no possible chance for a lively export business until the European ports are again opened. Inquiries for specialties, such as mining timber, railway ties and cheap construction wood, to take the place of some of the European softwoods, have been sent to this country, but the prices offered in some instances are not much more than will pay the freight charges.

Ocean freights are strong, and although an advance of from twenty-five to sixty per cent was made in 1914, the steamship companies have again given notice of an advance of twenty-five per cent for 1915.

Chief Inspector J. G. Creamer, in his annual report of the work done by the inspection bureau, stated that the aggregate quantity of lumber which passed through the hands of exchange inspectors was in excess of last year, Virginia and North Carolina pine, of course, constituting the great bulk of this lumber.

This does not embrace the business done here in hardwoods, a very small part of which is inspected through the bureau of the exchange. While the latter operates under the rules of the National Hardwood Lumber Association, the great volume of business is done directly under the auspices of the latter body, the stocks inspected here being mainly for the local trade.

The report of the secretary-treasurer, L. H. Gwaltney, showed a net gain of one in the membership and a balance in the treasury, after all expenses had been paid.

The election of officers resulted as follows: President, Rufus K. Goode-now, Canton Box Company; vice-president, Parker D. Dix, Surry Lumber Company; treasurer, L. H. Gwaltney, American Lumber Company.

Annual of the St. Louis Exchange

The Lumbermen's Exchange of St. Louis held its twenty-fourth annual business meeting, preceded by a banquet, at Anschutz' Mission Inn, on South Grand avenue and Magnolia street, Thursday evening, December 17.

The business meeting was a most harmonious one. The banquet was from 6:30 to 8 o'clock.

At the conclusion of the dinner President F. H. Smith called for order and stated that it was the last meeting over which he would preside, as the next meeting would be presided over by a new president. He stated he had been asked not to be too pessimistic in his remarks on business conditions. He believed they showed signs of a betterment and he hoped such would be the result.

Secretary Walter D. Dodd went into details in his report. He said that the receipts and disbursements had about balanced one another and that there was a nice little surplus in the treasury on which to start the new year. He stated the inspection department had done well during the year and had gained several hundred thousand feet, compared with the inspections made the previous year.

Thomas E. Powe, chairman of the membership committee, followed with his report, in which he said the present membership included thirty-five hardwood and four yellow pine local concerns and twelve hardwood and two yellow pine out-of-town concerns, making a total of fifty-three members. This is an increase in membership over the previous year, principally in out-of-town memberships. He believed there were many more out-of-town concerns that could be induced to become members and he hoped each of the present members would try to secure additional memberships during the coming year.

Charles E. Thomas, chairman of the traffic committee, made the most important and interesting report during the meeting.

Sidney F. Andrews, a well-known local attorney who had been employed by the traffic committee to conduct the fight against the freight rate increase, followed with a talk on freight rates.

C. L. Harrison of the Himmerberger-Harrison Lumber Company, Cape Girardeau, Mo., the only out-of-town member present, followed with a short talk.

A resolution was passed that a nominating committee be named to propose names for candidates for the various offices to be voted on at the annual election on January 4. The nominating committee named by President Smith was Thomas E. Powe, chairman, Ed Weisse and George H. Cottrill. They retired for a few moments to make their selections.

Upon their return the following names were submitted by the chairman: President, Charles E. Thomas, Thomas & Proetz Lumber Company; vice-president, E. H. Luehrmann, Chas. F. Luehrmann Hardwood Lumber Company.

Nine names were submitted by the committee to be voted on for directors, the seven getting the highest number of votes to be elected and seven names were submitted for the board of arbitration, the five receiving the highest number of votes to be elected.

St. Louis Club Elects Officers

The Lumbermen's Club of St. Louis held its regular monthly meeting and banquet and also the election of officers for the ensuing year at the Planters Hotel Tuesday evening, December 16.

The following officers were elected unanimously:

PRESIDENT—E. C. Robinson, E. C. Robinson Lumber Company.

FIRST VICE-PRESIDENT—C. A. Antrim, Antrim Lumber Company.

SECOND VICE-PRESIDENT—Frank J. Riefling, George W. Miles-Timber and Lumber Company.

TREASURER—C. P. Jennings, Berthold & Jennings Lumber Company. Re-elected.

SECRETARY—O. A. Pier. Re-elected.

STATISTICIAN—W. F. Biederman, manager National Lumber Manufacturers' Credit Corporation. Re-elected.

Following the banquet the business meeting and election took place.

The business meeting was opened by a talk from P. F. Cook, who spoke on the subject "Culture, Character and Citizenship." Mr. Cook's talk was one of the bright features of the meeting.

Reports from the retiring president, John A. Reheis, Secretary Pier and Frank J. Riefling, chairman of the membership committee, were submitted to the club.

President Reheis stated in his report that during the year fourteen new members had been added and that 900 out-of-town lumbermen had visited the club rooms during the year. He concluded by stating he could not miss the opportunity to refer to the lumber business. "We are familiar with what the substitute people are doing and it is up to us to get busy. I am pleased to see that the new Southern Pine Association has undertaken to raise a large sum of money for the purpose of advertising broadcast the advantages of yellow pine and if the money is judiciously spent it will no doubt do effective work. We, as lumbermen, have come to realize that we must give our commodity more publicity. We must inform the architect, engineer and consumer of lumber that it is plentiful, reasonable in price and can still be supplied for all purposes. I believe that the Lumbermen's Club and other similar organizations should encourage and support the manufacturers in such a movement."

The new members elected at the meeting were: L. M. Tully of the Louisiana Red Cypress Company, New Orleans, La., and R. E. McKee, local manager of the Long-Bell Lumber Company.

With the Trade

Faust Brothers Lumber Company Removes to Jackson, Miss.

A short time ago HARDWOOD RECORD announced the discontinuance of the Chicago office of the Faust Brothers Lumber Company of Paducah, Ky. A later announcement from this concern states that the main office will be removed from Paducah to Jackson, Miss., on January 1. This change is made in order that the company may be more closely in touch with its operations, thus insuring its being able to give customers' requirements even closer attention. In the meantime the operations on the Tennessee river will be continued and the Mississippi operation will be considerably enlarged. This company is in position to furnish quantities of stock in 1" to 3" poplar, 1" to 2" plain and quartered red and white oak, 1" to 4" ash and 1" sap and red gum.

London Concern Moves Office

Wright, Graham & Co., timber brokers, 123 Cannon street, London, E. C., England, announce that they have just completed arrangements for moving to more commodious offices at No. 3 Eastcheap, E. C. The company requests that cablegrams be addressed to the new location.

Anderson-Tully Company Purchases Bennett Plant

Announcement is made that the Anderson Tully Company has purchased the site and plant of the Bennett Hardwood Lumber Company in North Memphis. Readers of HARDWOOD RECORD will recall that

a short time ago J. N. Penrod, representing himself and the Abbott estate, bought the interest of E. T. Bennett in this firm, taking over the entire stock of lumber and the site and plant. Immediately following this transaction, Mr. Bennett began operating the plant under lease and is doing so at the present time. The purchase on the part of the Anderson-Tully Company was made directly from J. N. Penrod and associates. It is understood that Mr. Bennett will continue to operate the plant for the present, particularly until he has cut up the timber he has on hand. It is understood that, after this lease expires, the Anderson-Tully interests will operate the mill in connection with their other sawmill and their various box manufacturing enterprises in this city. The purchase price has not been made public.

East St. Louis Walnut Company to Resume Operations

The East St. Louis Walnut Company, which was compelled to close down at the commencement of the European war, because about ninety per cent of its business was export, has resumed operations. It is manufacturing stocks for army rifles. The contract calls for 50,000 gunstocks and together with other walnut pieces amounts to about \$60,000. An Eastern concern placed the contract and it is generally understood that the order comes from the English army.

Demonstrates the Utility of Mesquite for Novelty Woodwork

R. S. Brooks, operator of a box and crate factory at Fowlerston, Tex., recently made some demonstrations of the utility of mesquite for specialty woodwork. He had made up an array of special items, including trays, smokers' sets, goblets, drinking cups, match-holders, etc. He has also experimented with this wood for certain parts for furniture and for flooring. Mr. Brooks is going more fully into this proposition and expects to make something of it.

Death of William Pool Brown

William Pool Brown, one of the pioneer lumbermen of the Central West, and one of the best known hardwood men of the country, died at his home in Indianapolis, December 10, 1914, after a long siege of illness. While Mr. Brown had not been perfectly well for several years, his condition did not become serious until about ten days before the end. At that time an anemic condition which had been the chief source of trouble for some time became more pronounced, organic functions were interfered with, and he sank steadily.

The funeral was held Saturday, December 12, at Madison, Ind., his old home, where he had been in business for a quarter of a century. The funeral was largely attended by friends and associates, and flowers and telegrams of sympathy to the relatives came from all over the country.

W. P. Brown was a native of Dumfries, Scotland, and was born in 1841. He came to the United States with his parents at the age of four. His father was a farmer near Madison, Ind., and Mr. Brown grew up close to the land, and in touch with agricultural and timber development. His liking for the lumber business caused him to enter that trade as a young man and he was continuously in it for the remainder of his life.

In 1875 he formed the firm of Dow & Brown, which was famous in the black walnut business. The concern first ran a floating sawmill up and down the Ohio river, being one of the most prominent in this business, which is now almost a memory. Later a big mill was established at Madison, and the lumber manufacturing business was carried on here without interruption until 1896. During the greater part of this time walnut was a feature of the business, though later on, when the walnut vogue began to diminish, a general hardwood trade was developed.

In 1896, when the firm was dissolved and the Madison plant closed, Mr. Brown became a pioneer in the development of eastern Kentucky, opening up timber all along the Lexington & Eastern between Lexington and Jackson, Ky. This territory at that time was almost a wilderness, and the road established new stations for the lumberman as he located at one point after another and developed the timber of the region. Mr. Brown was practically the first hardwood man to see the immense possibilities of eastern Kentucky, which is now being developed to the full by means of the numerous railroads which have since been built in that territory. Until 1900 Mr. Brown maintained his headquarters in Madison, at that time going to Indianapolis. His eastern Kentucky business continued for eight years, or until 1904, when the Louisville business of W. P. Brown & Sons Lumber Company was established with his sons, Martin and Graham. In the meantime an Indianapolis yard had been established by Mr. Brown, and this was conducted until 1910, when his health first began to break. He never lost his interest in the business, however, and followed the development of the Louisville concern, which has become one of the leaders in the country, with close attention until the last.

Mr. Brown had a very attractive personality. While quiet and unassuming, he won many friends with his clean-cut honesty, his simple life and his genial disposition. He was of a kindly and friendly nature, and at the same time a keen business man, who could see opportunities and knew how to follow them up until they were fully developed. He was continuously successful in the hardwood business, and was able to meet changing conditions as they presented themselves.

The business of The W. P. Brown & Sons Lumber Company will be continued by his sons.

Death of George Henke

George Henke, president of The George Henke Company, 68 Beekman street, New York, N. Y., died on December 2 after an operation for intestinal trouble. Mr. Henke was the president and founder of this institution, which is the manufacturer of "Lorac," a preparation used for the prevention of checking, splitting and rotting of logs.

Mr. Henke had become very well known among sawmill and veneer mill owners all over the country, as he personally had gone into their plants to demonstrate his process.

It is supposed that the business of The George Henke Company will continue as usual.

Takes Over Whiting Interests

The Graham County Lumber Company has been organized to take over the interests of the Whiting Manufacturing Company in Robinson county, North Carolina, and it is expected that the company's band mill at Judson will soon be in operation. Walter Buell of Bay City, Mich., who makes his headquarters at Judson, has charge of the operations of the new company.

Get Together Conferences Started by Stearns Employes

The foremen of the Stearns Salt and Lumber Company, Ludington, Mich., have inaugurated a series of "get together" meetings for this winter, the first of which was held Monday evening, December 7, 1914, in the new hall recently erected in the mill yard. These meetings are a continuation of the efficiency meetings which were held last winter and which were productive of very gratifying results. The following department heads were present: Foster LaBar, general superintendent; Malcolm E. Miller, manager department of safety and efficiency; Charles Engstrom, foreman, green lumber yard; George P. Crocker, sawmill superintendent; Charles Hamilton, lumber yard superintendent; N. M. Jensen, night sawmill foreman; Charles Marquette, coopershop foreman; John Matson, salt packing foreman; John Moore, heading mill foreman; H. Smoke, stove mill foreman; W. H. Taplin, planing mill superintendent; Joseph Zehner, salt department superintendent.

Foster LaBar was elected president and Malcolm E. Miller, secretary for the coming season.

The principal subject under discussion was "Plans for Improving Conditions in the Various Departments." The work for the winter was outlined with a great deal of enthusiasm and it was decided to hold the meetings twice each month. Arrangements have been made to have several talks by men representing concerns closely allied with the lumber industry. A representative of the Simonds Manufacturing Company will give a stereopticon lecture on the manufacture of steel products, and in the course of his talk will trace the development of the raw material into the finished product of the Simonds Manufacturing Company.

Mr. Thompson of the Standard Oil Company will lecture on the formation and distillation of oils. Other lectures will follow which will be highly interesting and especially valuable from an educational standpoint.

THE LATE WILLIAM POOL BROWN, INDIANAPOLIS, IND.

Pertinent Information

Railroads Charged With Law Violations in Export Rates

With reference to the indictments returned by the Federal grand jury in New Orleans against the Louisville & Nashville Railroad for alleged violations of the Elkins act, the following statement was issued by the Interstate Commerce Commission:

The Louisville & Nashville, like common carriers generally in the South, has two sets of rates applying on many commodities from interior points to New Orleans and other Gulf ports. First, there are the domestic rates; then there are export rates, which are somewhat higher. The present case deals with the practice of the Louisville & Nashville in permitting export shipment of staves to move over its route from Alabama points to New Orleans at domestic rates. The rate on staves from Mobile to New Orleans "to shipside for export" is nine cents, while the rate "for depot delivery" is seven cents.

Our investigation disclosed that it was the common practice for shippers to bill shipments of staves from Mobile to New Orleans, consigned to an individual at that point. Upon arrival, the consignee was notified by

telephone, and he at once gave the Louisville & Nashville a written order to switch the carload to a steamship dock, stating in such order the final destination.

If there were an extra charge for this switching service, there would be greater justification for applying the domestic rate, but the evidence showed that the switching to shipside is without extra cost to shipper.

The only charge made by the Louisville & Nashville is the seven-cent rate applicable "for depot delivery." The switching expense, amounting to \$2 per car for switching to dock, is paid by the Louisville & Nashville to the Public Belt line, but this expense is absorbed by the carrier out of the seven-cent rate.

Roads Answer Otis Complaint

Gloves were not used by the carriers' attorneys in their briefs in regard to the complaints of the Otis Manufacturing Company of New Orleans. The Illinois Central filed its brief with the Interstate Commerce Commission last week and the Texas & New Orleans Railway Company presented its side of the case a few days later.

It is charged that the Otis Manufacturing Company is only nominally the complainant. The real influence behind the complaint is said to be the Freight Audit Company of Chicago. It is stated by the carriers that the officers of the Otis company showed great indifference in the case and that even the traffic manager of the concern was not at all active in pressing the complaint.

This point is made because it is the general understanding in Washington that the commission flows on cases that are brought up by professional searchers for errors, in the hope of developing reparation cases.

With respect to the complaint against the Illinois Central and other lines in the matter of mahogany rates to Indiana and Michigan furniture manufacturing centers, the carriers acknowledge that their tariffs have not been kept perfectly in line owing to the comparatively light movement of mahogany. The general basis of making the rate five cents higher than that on native lumber has been departed from in some cases owing to fourth section complications and constantly recurring changes in the lumber rate.

It is asserted that mahogany should take a higher rate than native woods because of the difference in value; the volume of the tonnage; loading conditions and the difference in competitive conditions. The carriers base average values as follows: Mahogany, \$90 per thousand; oak, \$40; cypress, \$35, and pine, \$18.

Advantage as to competition is all with New Orleans, the brief states. The Otis company manufactures its lumber right on the levee of the Mississippi river. Logs are brought from the tropics in vessels which discharge them into the mill pond. There is no rail haul. This enables the Otis company, it is stated, to deliver each 3,200 pounds of mahogany at Sturgis, Mich. (which is used as an example), for \$4.96 cents less than a Louisville competitor. The Louisville manufacturer has to haul logs from the Gulf coast by rail. There is considerable waste on which freight has to be paid. It costs \$14.56 to lay down 3,200 pounds of mahogany lumber in Sturgis if the manufacturing is done in Louisville. Lumber manufactured in New Orleans can be placed in Sturgis for \$9.60, it is said. This point is made by the railroads to show that the present rates from New Orleans to Sturgis and other points are not excessive. It is stated that the carriers already are working on tariffs which increase the rates on mahogany between New Orleans and middle western points.

In their effort to establish that there is large profit in the business handled by the Otis company, the carriers point to the prosperous condition of the Otis firm. It has been manufacturing mahogany exclusively for thirty-five years. The average monthly shipments by rail are fifty cars. This represents only fifty per cent of the business done by the company, the brief states, the other portion moving by water.

In objecting to the rates between New Orleans and Dallas and Houston, Tex., the complainants object to having mahogany classed higher than walnut. The carriers say that the highest average price ever paid for walnut was in 1904 when it reached \$45.64. In 1911, it is stated, the average value of walnut was \$31.70. Compared with mahogany, which they average at \$90, the carriers maintain, walnut should take a much lower rate. It is charged that claims of competition with walnut are not based on fact. The carriers fail to find record of any walnut production in Louisiana and Mississippi moving to Texas points and state that no one in New Orleans is engaged in the manufacture or the distribution and sale of walnut in Texas.

It is asked that the case be dismissed.

Reparation Probable on Freight Overcharge in Arkansas

In the case of the C. E. Ferguson Sawmill Company versus the St. Louis, Iron Mountain & Southern Railway Company and the United States, with the Interstate Commerce Commission as intervenor, the federal court at Little Rock refused to grant the temporary restraining order asked by the railway company, to prevent the enforcement of the commission's order of reparation and to prevent the sawmill company from prosecuting its suit against the railroad in the state court to collect the reparation awarded, in the decision given out on December 5.

This case arose over an award made by the Interstate Commerce Commission to the Ferguson company in reparation of overcharges on certain shipments of cypress lumber. The railroad refused to pay the awarded reparation, and the sawmill company brought suit in the state court to obtain judgment and execution thereunder. The railroad thereupon sought to obtain a temporary restraining order against the sawmill

company to prevent it from prosecuting the suit in the state court, and further to enjoin the United States and its Interstate Commerce Commission from enforcing its award of reparation, upon the theory that no damage to the lumber company had been shown.

The conclusions of the court were that the railroad company overcharged on the cypress shipments and that it owes some one the amount of the overcharges, or the reparation awarded by the Interstate Commerce Commission, but that the federal court would not attempt to say to whom the reparation belongs; that those matters might properly be brought up on the trial of the case in the state court.

Forest Exhibits for California

Part of the government's exhibit for the Panama California exposition at San Diego left Washington last week. This portion has to do with the national forests of New Mexico, and will be shown in the New Mexico building, the exhibit having been prepared in co-operation with the state board of exposition commissioners of that state. The material also shows specimens of the principal timber trees of New Mexico and their uses.

Other exposition material is to leave soon for San Francisco, where it will form a part of the Panama Pacific exposition. Part of this is being prepared through co-operation between the Forest Service and the United States Civil Service Commission. The commission passes on the qualifications of all candidates for positions in the Forest Service, testing the fitness of those who wish to become forest officers through outdoor examinations in riding, surveying, timber estimating, and similar matters as well as by more conventional methods; its exhibit will illustrate the duties of these officers.

Co-operation also exists, in the preparation of exhibit material, between the Forest Service and the Bureau of Education. This shows how forest subjects are used in the public schools, in connection with nature study, commercial geography, agriculture, and the like. One of the exhibits is a display made by the normal school pupils of the District of Columbia, in which a number of those who are studying for teachers' positions entered a prize contest on tree study. Each of the contestants prepared a separate exhibit showing the life history and the products of individual trees, such as white pine, hickory, or sugar maple.

All Wood Declared Contraband

The Germans have declared all wood contraband, even if only firewood. The purpose of passing that order was to hinder shipments to England from Norway and Sweden. Cargoes from certain ports of those countries must pass across waters menaced by German war vessels, and shippers will not care to take chances of being captured. Consequently, the timber trade in that region is either crippled or at a standstill. The interference hurts Norway and Sweden more than England. That country can buy timber elsewhere, but Sweden and Norway have no other market at present for that product, and cargoes ready for shipment are tied up. This is another case where the innocent by-stander is hit.

Imports of Sumac Bark

The imports of sumac bark and leaves into the United States amount to about 900,000 pounds a month, and it is valued at two and a quarter cents a pound. Most of the supply comes from countries of the Mediterranean region, chiefly Italy. Small branches with their leaves are cut, dried, and in some instances ground to powder. It is used for tanning fine grades of leather. At one time the industry of tanning goat skins with sumac was carried on almost wholly in Morocco, Africa. Such leather came to be called the name of the country that produced it, and it has been known ever since as morocco, though very little of it now comes from Africa.

Mahogany and Hardwoods in England

An English trade paper in commenting on the market says the mahogany trade continues flat, and the deliveries have in recent weeks rarely exceeded twenty-five per cent of those in normal times. Of course, the cabinet-making trade is slack, and until the war is over people will not lay out money on articles of furniture that are not absolutely essential. This, of course, affects the trade in American hardwood also, but not so much as is the case where mahogany is concerned. It would not be so very surprising, however, if some of the most inferior mahogany finds a market away from the usual run in these times of almost phenomenally high prices for certain dimensions of sawed softwoods. In fact, the war may prove a blessing in disguise to the mahogany market.

Building Operations for November

Building operations for November make almost exactly the same relative showing, as did October, namely, a decrease of 20 per cent, as compared with a year previous. The comparative loss for September was greater, 32 per cent, so that the statement may be regarded as recuperative. The shrinkage, however, is now the more general throughout the country, indicating that the causes are countrywide. Of 71 cities, 56 show comparative losses. It is almost universally proclaimed that sentiment at present is distinctly better than a month ago, so that the index finger of probability points to recovery. However, as the momentum of large bodies is not so easily swerved from its course as in lighter affairs, it may be held questionable whether the full force of the sentimental and actual improvement will become immediately apparent. If the statement is not specially encouraging, it cannot be regarded as discouraging.

The official reports of building permits issued by 71 cities during November, received by the American Contractor, Chicago, reach a total of \$32,805,789, as compared with \$41,005,514, for November, 1913, a decrease of 20 per cent. A few cities show decided gains, due usually to special causes. Thus, the phenomenal increase at Oklahoma is caused by the letting of the contract for the \$1,500,000 state house. Cleveland scores an interesting gain, 73 per cent, and other notable increases are those of Peoria, 228 per cent; San Antonio, 105 per cent; Tacoma, 326 per cent, and New Haven, 47 per cent.

For the first eleven months of the year the total value of the building operations of the cities are \$585,841,305, compared with \$633,776,574, for the same period last year, a decrease of 7 per cent. The detailed operations are as follows:

City—	November, 1914.	November, 1913.	Per Cent Gain, Loss.
Akron	\$ 179,395	\$ 173,135	4

Lighterage Changes at New York

Shippers of lumber and other forest products, which must be handled at wharfs and on water at New York, will be interested in a notice of change in charges, which was sent out on December 17 from the office of the National Wholesale Lumber Dealers' Association, New York. The tariffs and regulations governing the lighterage service were issued by the various railroads to become effective January 1, 1915. A protest has been filed with the Interstate Commerce Commission requesting the suspension of these tariffs pending a hearing. Following is a summary of the proposed new regulations:

All "lighterage free" freight received on lighters or barges, or delivered from lighters or barges, at piers other than station piers of the respective carriers, will be handled to or from stringpiece or to or from vessel's slings, and a charge of 12 cents per ton, net or gross, as rated, will be assessed on all such freight in addition to the rate applying from or to the point at which the property is received or delivered.

The foregoing will not be applicable to import or export freight interchanged direct with steamship lines.

In case of shipments the actual weight of which is less than the carload minimum weight, but on which the carload rate and minimum weight have been applied in order to secure the benefit of free lighterage, the charge above prescribed will be assessed on basis of the carload minimum.

When the lighterage service is performed by outside lighters or barges,

the charge of twelve cents per ton will be collected and retained by the carrier, except as noted in the following paragraph:

The carrier, at its option, will arrange with the shipper or consignee to load or unload the freight, and when such service is performed by the shipper or consignee an allowance will be made of not to exceed twelve cents per ton, net or gross, as rated, the captain of the lighter or barge to file with the lighterage department a statement that the loading or unloading was performed by shipper or consignee.

This means that on lumber delivered by lighter in New York harbor it is proposed to make a charge of twelve cents per ton for handling from the lighter or canal boat over the stringpiece.

The charges for towing freight to certain accessible points beyond the free lighterage limits are increased. These increases apply to or from Harlem River points beyond Jerome Avenue bridge; East River points beyond Oak Point; points on Kill Von Kull, Newark Bay and Passaic River; Hoffman's Island and Swineburge Island.

The charges for staking, wiring, or dencing shipments on cars will be one dollar a car when material is furnished by the shipper and labor by the railroad company; but when both material and labor are furnished by the railroad company the charge will be four dollars for single and eight dollars for a double car of lumber or timber; four for single and fifteen for double cars of logs; and seven and a half dollars for single and fifteen for double cars of poles and piling.

The present rates are fifty cents per car when material is furnished by shipper and two dollars per car when material and labor are furnished by the carrier.

Memphis Club Elects New Officers

The annual election of officers of the Lumbermen's Club of Memphis was held Saturday evening, December 19, in the Business Men's Club rooms. The officers elected were:

President—Charles G. Kadel (Blue ticket); first vice-president—J. R. McPadden, Paapeke-Leicht Lumber Company (Blue); second vice-president—F. W. Dugan, F. W. Dugan Lumber Company (Blue); secretary-treasurer—D. E. Heuer, A. N. Thompson & Company (Blue); Directors—H. W. Bonner, J. H. Bonner & Son (Blue), C. C. Dickinson, E. Sondheimer Company (Red), and Joe Thompson of the Dudley Lumber Company (Red).

The polls opened at 7 o'clock and remained open for two hours, during which time 109 votes were cast. Campaigning of the most lively character had been in progress for an entire week but the campaign committees and the candidates whose cause they were espousing were active until the last man had turned over his ballot to the election officers.

While the votes were being counted by the proper officials, President Allen created some surprise by asking Mr. Rush, candidate for the presidency on the red ticket, to escort Mr. Kadel, head of the blue ticket, to the platform. President Allen uncovered a glittering array of silver on a table before him and presented it to Mr. Kadel in behalf of the Lumbermen's Club of Memphis. Mr. Kadel expressed his full appreciation of the splendid gift but declared that he was entirely too full (clocker number, please) for utterance and asked to be excused from making a speech under the circumstances.

Mr. Kadel's platform as briefly outlined by him in his speech following the announcement of election results created much merriment. It is apparently broad enough for all the members to stand upon. He said: "If you want to save your money, we are with you; if you want to have a tango party every evening in the year, we are with you; and if you want to give all of your money to the pretty young girls and the handsome widows, you will not find any opposition whatever from us."

Mr. Rush, defeated candidate for the presidency, expressed regret that he had not been successful, but declared that he was entirely satisfied with the selection made by the club and that he could be counted upon to do his best in whatever capacity his services were needed.

The other successful candidates were called upon and responded briefly. One of the features of the evening was the reading of the following telegram from three members of the club now sojourning in Los Angeles, E. E. Taenzer, J. W. Thompson and C. N. Kellogg: "Although absent, we are with you in spirit. Best wishes."

The newly elected officers will be installed at the first regular meeting to be held after the first of the year.

Hardwood News Notes
 < MISCELLANEOUS >

The Utica Box Company has been incorporated at Utica, N. Y., with \$35,000 capital.

H. A. McCowen & Co., walnut manufacturers of Salem, Ind., are removed to Louisville, Ky.

Owens Brothers of Eau Claire, Wis., are planning the erection of a sawmill on Bear Creek.

The Louisville Silo & Tank Company has increased its capital stock from \$10,000 to \$60,000.

The Washington Furniture Company has been incorporated at Washington, N. C., with \$10,000 capital.

The Farm Implement Company was incorporated at Washington, D. C., with a capital stock of \$100,000.

The Clarkston Furniture & Buggy Company has been incorporated at Clarkston, N. C., with \$10,000 capital stock.

The United Furniture Manufacturing Company has been incorporated at Port Allegbeny, Pa., with a \$25,000 capital stock.

H. R. Whyte has been appointed receiver for the Buena Vista Veneer Company at Des Arc, Ark., and South Bend, Ind.

The Pioneer Box Company of Crawfordsville, Ind., manufacturer of wire bound boxes, will establish a factory at St. Louis.

The Oakville Wagon Company has been incorporated at Watertown, Conn., with \$25,000 capital to manufacture wagons.

A creditors' committee has been appointed to take over the affairs of the Kimball-Lacy Lumber Company, Arkansas City, Ark.

The Bluepoint Mangle Roller Company has been incorporated at Derick, N. Y., with an authorized capital stock of \$45,000.

The Capitol City Carriage Factory, Des Moines, Iowa, was partially destroyed by fire recently. The loss is reported to be \$40,000.

The Baker, Coleman & Carroll Company, manufacturers of garden plows, has selected Shenandoah, Ia., as the location for a new factory.

The Northwestern Cooperage & Lumber Company, Gladstone, Mich., is reported to have suffered a \$20,000 loss by fire about a week ago.

The A. M. Maxwell Company is reported to have been incorporated with \$300,000 capital to manufacture automobiles at Indianapolis, Ind.

Fire destroyed the plant of the Hickory Manufacturing Company at Johnson City, Tenn., on December 11. The loss reported is \$100,000.

The Williamson & Brown Land & Lumber Company at Whiteville, N. C., recently lost its plant by fire, which destroyed \$75,000 worth of property.

William E. Field of St. Louis, formerly superintendent of the Cupples Woodenware Company, dropped dead at a restaurant table in that city recently.

Cohen & Danovitz has been incorporated under that style at New York City to manufacture sash, doors, trim and woodwork. The capital stock is \$10,000.

The Master Talking Machine Manufacturing Company has been incorporated at New York with a capital stock of \$500,000. This concern will manufacture talking machines.

It is announced from Warsaw, N. Y., that the American Master Organ Company will establish a plant at that place, and that the Warsaw business will be incorporated with \$100,000.

The Alaska Lumber Company is the title of a recently incorporated concern which will operate at Bryson City, N. C., with a capital stock of \$100,000, for the manufacture of lumber.

A report comes from Whitesburg, Ky., that George M. Adams and others from Sandy Lick Creek, Ky., are planning the establishment of a planing mill at Whitesburg, shortly after the first of the year.

It is reported from Houston, Tex., that efforts are being made by the Texas Forestry Association to perfect the formation of a state forestry commission and to create the position of state forester at the next session of the legislature.

It is reported that a furniture concern to be known as the Peerless Manufacturing Company will shortly be incorporated at Holland, Mich. H. E. Adena, formerly of the Holland Furniture Company, is reported to be behind the new enterprise.

CHICAGO

HARDWOOD RECORD gratefully acknowledges receipt of a variety of beautiful and artistic calendars from:

The Radford-Portsmouth Veneer Company, manufacturer of rotary cut veneers, Radford, Va., entitled "Daphne of the Roses"; E. W. Pratt, Jr., Hopkinsville, Ky., who can supply hounds, feloes and plow beams in car-load lots, and D. H. Day, manufacturer and dealer in hardwood and hemlock lumber, bark, etc., Glen Haven, Mich., each sent in one descriptive of "Winter Evening"; "Vivian," from both the Johannesburg Manufacturing Company, Johannesburg, Mich., wholesaler of northern hardwoods, and the Miller Lumber Company, manufacturers of hardwood lumber and box shooks at Marianna, Ark.; Wood-Mosaic Company, manufacturer of lumber, flooring and veneers, with headquarters at New Albany, Ind.; S. D. Childs & Co., bandlers of all kinds of office stationery and supplies, Chicago, Ill., and a good sized office calendar from the American Veneer Company, manufacturer of built-up panels and veneer seatings, Hoboken, N. J.

Frank Purcell, bandler of walnut logs, veneers and lumber, Kansas City, Mo., has been in Chicago for the last few days on business. He left Tuesday night for Kansas City, as he was very anxious to get home before the holidays.

Robert Maisey, formerly associated with J. H. Dion of Maisey & Dion, hardwood wholesale yard people, Chicago, has recently sold out his interest in the firm to Mr. Dion. Mr. Maisey has been connected with the hardwood business in Chicago for the last thirty years. The present business was organized a number of years ago and has been carried on very successfully since. Mr. Dion will handle the entire affairs of the company from now on.

Charles Dregge of the A. L. Dennis Salt & Lumber Company, Grand Rapids, Mich., spent a few days in Chicago last week.

R. L. Jurden of the Penrod-Jurden-McCowan Lumber Company and the Penrod Walnut & Veneer Company, Kansas City, is spending a few days in Chicago on business.

D. J. Arpin, president of the Arpin Hardwood Lumber Company, Grand Rapids, Wis., was a Chicago visitor last week.

W. D. Greeley, assistant forester of the United States Forest Service, Washington, D. C., and H. F. Weiss, director of the Forest Products Laboratory, Madison, Wis., were two prominent visitors who came to Chicago to attend the meeting of the lumbermen at the Hotel La Salle.

Walter C. Winchester of the Turtle Lake Lumber Company, Grand Rapids, Mich., passed through Chicago last Wednesday on his way north.

D. L. Hutchinson of the Dickson Planing Mill Company, Dickson, Tenn., was in the city on December 15.

H. D. Tiemann, wood technologist in charge of investigations along this line at the Forest Products Laboratory, Madison, Wis., spent several days in Chicago a week ago in connection with his work.

The United States Barber Furniture Company of Chicago has recently sustained an involuntary petition in bankruptcy.

HARDWOOD RECORD acknowledges receipt of a very useful and well gotten up booklet entitled "Belt Sanding," issued by the Mattison Machine Works, Beloit, Wis. This is the fourth number of the series which contains practical articles on belt sanders.

This office acknowledges receipt of a pamphlet on inter-insurance by Charles F. Simonson, recently appointed manager of the National Lumber Manufacturers' Association inter-insurance exchange.

A book entitled "Merchandising of Lumber" has just come to HARDWOOD RECORD from the National Lumber Manufacturers' Association. It contains a complete report of the question of merchandising of lumber as discussed before the annual convention of that association at Chicago, last May.

NEW YORK

Sam E. Barr finds present business all to the good, though of course he could take care of some more. He reports a good number of orders for January and February shipment which gives a good start to the new year. He is making a specialty of hardwood flooring and finds a steadily increasing demand for this very meritorious article.

W. D. Magovern, local hardwood flooring specialist and the pioneer in the warehouse scheme for prompt delivery, has increased his facilities on the upper west side so that he now carries about 1,000,000 feet of stock at all times. He handles the famous Forman hardwood flooring and Jackson Lumber Company's long leaf yellow pine flooring.

The wholesale firm of Rouse & Van Dusen will be dissolved December 31. F. B. Van Dusen and W. J. Rouse are partners.

The local office of the Emporium Lumber Company reports only reasonable activity but looks for better things in early spring. W. L. Sykes, head of the company, is spending the winter in Los Angeles.

A petition in bankruptcy has been filed against E. Schloss & Co., Inc., manufacturers of furniture, with plant at 530 Cherry street. Liabilities are \$35,000 and assets \$5,000. Charles L. Brookheim has been appointed receiver.

A petition in bankruptcy has been filed against the Norfolk Lumber Company of 245 East 137th street. It is alleged that the company made an assignment on December 17. The company was incorporated in June, 1911, with capital stock \$10,000. Its principal business was dealing in hardwood floors.

BUFFALO

H. L. Vetter of the National Lumber Company has returned from a business trip to Boyne City and other points in Michigan, where he placed a number of orders for maple flooring.

Blakeslee, Perrin & Darling report the hardwood trade as picking up. Trade this month has been on a satisfactory scale, having largely exceeded that of three months ago.

The Standard Hardwood Lumber Company reports that the inquiries for lumber are on the increase and it is believed that business will show a good gain within the next two or three months.

Miller, Sturm & Miller state that the hardwood trade is inclined to be quiet this month, but a number of orders have lately been received for oak, maple and poplar.

The Hugh McLean Lumber Company has had a pretty good amount of business of late in the better grades of quartered oak, in which prices are holding up better than in most woods.

M. M. Wall has been elected treasurer of the New York State Motor Federation, an organization composed of automobile clubs of Buffalo, Rochester, Syracuse, Utica and New York, with 11,000 members.

T. Sullivan & Co. report the brown ash demand as keeping up well, in spite of the quiet in most other hardwoods. Sales of this wood have been large during the past month.

The Yeager Lumber Company has found plain oak one of the chief hardwoods in demand during the past two weeks. Trade is expected to pick up within the next few weeks.

It is reported that the Pierce-Arrow Automobile Company has received another order within the past two weeks for several hundred motor trucks to go abroad. The company is now filling a French army order for trucks.

A. A. Mason has lately been calling on the furniture trade at James-

town and reports that no disposition to stock up is manifest, though manufacturers are buying moderately.

G. Elias & Bro. report the hardwood trade as rather quiet, with some falling off of local trade because of a slow-up in building operations.

PHILADELPHIA

Charles K. Parry of Charles K. Parry & Co., owners of the Carolina Spruce Company, Pensacola, N. C., says business so far this month has shown a substantial improvement over last month, which is very encouraging as to outlook. The stock exchange has opened strong for a brisk business; foreign investors in American securities instead of dumping their holdings on the market regard them as sound and reliable. Charles K. Parry & Co. have removed their offices to 402 Land Title building, where they have better facilities for conducting their business.

Owen M. Bruner, president of the Owen M. Bruner Company, declares that there will be live business in 1915. For one source, the warring countries must have clothes as well as numerous other necessities for the armies and the non-combatants, and this country is looked to for relief in their extremity. The factories, the material and the labor are here, consequently the mills and other trades will flourish. Mr. Bruner, who is possessed of keen insight, is able to adduce many other good reasons why good business may be expected for 1915.

Frank H. Hawkins of the Kirby & Hawkins Company, handlers of railroad ties and lumber, says the carrying companies have given notice that they do not intend to buy anything for some time, which stand has also been taken by other large corporations, but it is significant that a quiet inquiry is being made as to the stock situation and he will not be surprised if at almost any time after January 1, 1915, a brisk business will start up. W. S. W. Kirby, formerly of this house, has resigned all connection with the concern.

J. Elmer Troth, president of the J. S. Kent Company, says more interest is shown by the buyers as to stocks and quotations, which augurs better business and stiffer prices for the new year.

Frank E. Schofield of Schofield Bros., owners of Saltkeatchie Lumber Company, Schofield, S. C., and the Honaker Lumber Company, Putnam, Va., has just returned from the latter point. He says the frame work and roof of the new triple band mill which is to replace the one burned on October 17 is now completed and work is being pushed. He thinks buyers are realizing that rock bottom in prices has been reached and will soon get in the market for goods.

E. M. Bechtel, sales manager for Wm. Whitmer & Sons, Inc., argues that as inquiries are multiplying and minute information continues to be sought as to possible arrangement for future delivery with a decided disinclination on the part of the seller to close any deals for spring delivery at prevailing prices, a much improved business is anticipated for the new year. During the last few days inquiries for considerable lumber have been made by one of the railroads.

George Houck, general manager for the Highland Lumber Company, Inc., Seth, W. Va., has just returned from South Carolina where he has been inspecting the large electric power sawmill of the Atlantic Coast Lumber Corporation. The Highland concern intends to employ the best electric motor power in its new mill, which will be erected next spring. Mr. Houck says his company's business so far this month is way ahead of November, and things look bright for 1915. There is an inclination on the part of the buyers to close deals for future delivery at present values, but they will receive very little encouragement at this time, for his concern will not book orders now for delivery after January, 1915, without an advance in price.

J. W. Turnbull of the J. W. Turnbull Lumber Company predicts considerable new business after the first of the year. Buyers are beginning to realize that this is a good time to buy. Mr. Turnbull has just returned from Bristol, Tenn., where he has been inspecting the stock situation.

W. H. Wyatt of the Jackson-Wyatt Lumber Company owns to being a confirmed pessimist up to a month ago, but his views have changed, as he realizes that trade in other lines is swelling with orders from the war zone and inquiries in the lumber trade continue to increase.

Fisher Dalrymple of the Thomas E. Coale Lumber Company reports a tangible improvement during the last fortnight and is confident that after the first of the year a progressive prosperity may be relied on.

J. H. Campbell of Currie & Campbell says business is gradually livening up and that January promises a good showing. Mr. Campbell evidently is relying on the fighting countries for a good business, as trading here on account of the danger in shipping will be considerably interrupted as long as the war lasts. His firm recently made a contract to handle the output of the Graham County Lumber Company's mill at Judson, N. C. This concern manufactures a general line of hardwoods and turns out about 50,000 feet per day.

PITTSBURGH

Samuel H. Landis is arranging to rebuild his handle factory at Quakertown, Pa., which was burned last summer and which will employ about thirty hands.

C. W. Lams of this city has bought the plant of the Ebeensburg Planing Mill Company at Ebeensburg, Pa.

The newly organized Universal Lumber Company is now very nicely established in the Diamond Park building. It will make a specialty of

hardwoods and white pine. The officers are: Arthur Arubheim, who was connected with the Erving & Stoner interests of this city for twelve years, is president; Henry Resnick, for the past two years credit manager for the Fairbanks Company of Pittsburgh, is vice-president; William Lichtenstul, for the past three years manager of the real estate department of the Pittsburgh Industrial Development Commission, is secretary and treasurer, and A. G. Reddioger, a lumber manufacturer of Templeton, Pa., will also be one of the directors.

John McKeown, furniture manufacturer of this city, will build a large plant on the Potomac river in West Virginia where he has lately bought 500 lots. The plant will manufacture furniture novelties.

The Pennsylvania Door & Sash Company and the Commercial Sash & Door Company of this city have bought the entire business and stock of the Pittsburgh Hardwood Door Company. The stock inventoried at \$150,000 and will be divided equally between the two purchasing concerns. The Pittsburgh Hardwood Door Company was organized about eight years ago in this city to handle the hardwood doors of the Paine Lumber Company, Ltd., of Oshkosh, Wis. It had large quarters in the terminal warehouses on the South Side until two years ago when a fine four-story plant was built at Thirteenth and Pike streets for its special use. The company has been operating the past two years as a wholesale and retail concern. It will now abandon the Pittsburgh field entirely. Nathan Paine, vice-president of the Paine Lumber Company and president of the Pittsburgh Hardwood Door Company, handled the sale for the latter concern.

J. N. Woollett, president of the Aberdeen Lumber Company, announces that it is very hard to move gum and cottonwood on contracts placed a long time ago. Everybody is holding up shipments so far as possible and at present there are no new buyers in the market.

O. H. Babcock of the Babcock Lumber Company believes that there will be quite a revival of lumber buying after the first of the year and that prices are bound to reach a higher level soon.

President J. L. Kendall of the Kendall Lumber Company reports that total sales for the year will not be more than ten per cent below those of 1913. The company is now renewing contracts at nearly the same prices received last year. G. M. Chambers, sales manager of this company, will be located in New York City for the next few months, where he has been very successful in digging up new trade.

The Home Lumber Company is a new concern at Warren, O., which will handle considerable lumber for manufacturing plants in the Mahoning valley. The members are T. F. and T. A. Miller of Youngstown, and F. D. McClure, E. D. Morrow, N. G. Baldwin, H. E. Webster and Roscoe Winnagle of Warren.

BOSTON

The management of the George W. Gale Lumber Company of Cambridge has been temporarily placed in the hands of a committee of the largest creditors, consisting of George H. Davenport of Davenport, Peters Company, George C. Cutler of Stetson, Cutler & Co. and Fred S. Ramsey. This action was taken December 7 since which time the payment of bills for merchandise has been suspended. An accounting firm is now taking account of stock and looking over the situation of the company, and it is hoped that it may arrange some plan whereby the present conditions may be passed over and this old and excellent firm continue in business. In the early part of the year a new thoroughly modern plant was constructed in the Mt. Auburn section, and this large employment of capital was followed by the general decline in business which placed the company in a position where with even their finest facilities for manufacturing, handling and delivering, it is obliged to take the course referred to above to preserve its interests and organization.

The Norwegian Steamer Falk and the British Steamer Elswick Tower, arriving in this port with about 2,200,000 feet of mahogany logs from Frontera and Axim, Africa, for a well-known Boston firm, have given a new impetus to the local trade in this wood. There are predictions that these arrivals, valued at about \$120,000, forecast a revival of the business formerly carried on by a fleet of square riggers and it is expected that a permanent service may be established.

A petition in bankruptcy was filed December 4 against the Apponaug Lumber Company of Warwick, R. I., with liabilities of \$29,592, among which appear three Boston firms. The assets are scheduled at \$12,055.

BALTIMORE

Suit has been filed at Ashland, Ky., by W. C. Dunnington of Mountain Lake Park, Md., and E. H. Sincell of Oakland, Md., against the U. S. Bond Lumber Company, and the Bond Foley Lumber and Oil Company for \$325,000 alleged commissions and profits on the sale of 37,000 acres of timberlands in Jackson and Rockcastle counties, Kentucky. The plaintiffs state that the lands sold for \$925,000 and that they had a contract with the owners to take \$600,000 as commissions. They maintain that they introduced the owners to agents of the Standard Furniture Company, which was ready to pay \$925,000, but that in order to defraud the plaintiffs, the defendants conspired with the Standard Furniture Company to have the Bond-Foley Company incorporated and the property sold to that concern. Mr. Dunnington is proprietor of Mountain Lake Park and Mr. Sincell is an Oakland attorney.

The will of the late Charles F. Shaffer, president of the C. F. Shaffer

Lumber Company of Laurel, Md., which was filed recently, shows the deceased to have been a wealthy man. According to a preliminary inventory the estate will foot up some \$222,000, to which sum additions are to be made. In the total is included \$25,000 of the capital stock of the C. F. Shaffer Lumber Company, and not less than \$150,000 in real estate. The estate is left share and share alike to the eight children of the deceased.

Fire broke out recently in the factory of the F. X. Ganter Company, manufacturer of show cases and office fixtures, at Leadenhall and West streets, but timely discovery of the blaze and the quick work of the fire fighting force of the factory caused the flames to be confined to a narrow compass. The damage is small, and is fully covered by insurance.

On board the steamer Larchmore, of the Johnston Line, which arrived here from Liverpool on December 11, were 37 logs of walnut destined for middle western points.

◀ COLUMBUS ▶

Elaborate arrangements are being made for the annual meetings of the National Association of Builders' Exchanges and the Ohio State Association of Builders' Exchanges, which will be held in Columbus in January. The state convention will be held January 25 and the national organization January 26 to 28, inclusive. The headquarters for both conventions will be at the Virginia hotel. In the state meeting the principal topic of discussion will be the new state building code which has been formulated by a special commission named by the last session of the Ohio legislature. In the national association the question of a uniform contract between architects and contractors will be discussed. J. W. Lewman of Louisville is president and J. M. Vollmer of Louisville secretary of the National Association of Builders' Exchanges. John W. Boren of Dayton is president and E. A. Roberts of Cleveland secretary of the state organization.

The Home Lumber Company of Warren, O., has been incorporated with a capital of \$12,000 to deal in lumber, by Roscoe Winnagle, W. G. Baldwin, F. D. McClure, T. F. Miller and H. E. Webster. Business was started December 21.

Papers have been filed with the secretary of state increasing the authorized capital of the Anchor Lumber Company of Cincinnati from \$25,000 to \$50,000.

The Citizens' Supply and Elevator Company of Cleveland has been incorporated with a capital of \$50,000 to deal in lumber and other building supplies, by V. J. Minarik, J. J. Sachra, J. L. Paton, C. J. Hodous and J. S. Hodous.

J. J. Jennings, cashier of the City National Bank of Columbus, has been named receiver for the Columbus Saw Mill Company, upon the application of Jennie B. Cummins and J. N. Thompson. The assets are estimated at \$1,743 and the liabilities \$6,012.

Messrs. Hartson and Hill of Painesville, O., have leased the old bending works plant at Wellington which will be remodeled into a factory for the manufacture of handles.

F. B. Pryor of the W. M. Ritter Lumber Company reports a good demand for hardwoods when the season of the year and business depression are taken into consideration. Buying is about equally divided between the factory and the yard trade. Prices are generally well maintained, although some cutting is reported where stocks have accumulated. Shipments are coming out promptly. Dealers' stocks are generally light.

John R. Gobey of John R. Gobey & Co. reports a fairly good demand for hardwoods. Buying is limited because of the approach of the semi-annual inventories.

◀ INDIANAPOLIS ▶

William J. Mount, a lumber dealer of Miami, has filed a voluntary bankruptcy petition in the United States court with assets of \$10,555.13 and liabilities of \$13,498.48.

Johnathon Farver, Valentine D. Weaver and Hiram Norris have organized the Farver Lumber Company at Shipshewana, which has been incorporated with an authorized capitalization of \$25,000. A general lumber business will be conducted.

William M. Dickerson, a pioneer hardwood lumber and veneer manufacturer, died at his home here December 16 after a short illness. He was first with the old Charles Murry mill and later with the Indiana Lumber and Veneer Company and the Advance Veneer and Lumber Company, retiring three years ago. He is survived by a widow and four children.

The Indiana Manufacturers' and Shippers' Association, comprised of several hundred manufacturers in all lines of business, at its annual meeting here December 15, decided to submit a workman's compensation bill to the legislature next month. All manufacturers would be required to carry insurance and the law would be administered by a state board. Compensation for injury would be one-half the weekly salary, with a minimum of \$4 a week and a maximum of \$10 a week. For permanent disability, the workman would be compensated for ten years. In case of accidental death, the widow or children under sixteen years of age would receive \$100 for funeral expenses and compensation for three hundred weeks. For permanent disfiguring not permanently disabling the workman, compensation would be fixed by the state board.

◀ MEMPHIS ▶

The committee which went to New Orleans last week to secure the permanent headquarters of the Yellow Pine Manufacturers' Association, has returned to Memphis. It reports that while there appeared to be a great deal of sentiment favorable to Memphis, it had been decided not to determine upon permanent headquarters of the association until the reorganization had been entirely perfected. R. E. Montgomery and H. R. York were among the lumbermen who composed this committee, which represented the Business Men's Club. It is understood that the decision regarding the permanent headquarters will be made some time in January.

W. H. Russe of Russe & Burgess, Inc., has been made a member of the executive committee of the International Trade Conference which recently met here. This organization has for its purpose the increasing of the outlets for hardwood lumber and other products in Latin America and the choice of Mr. Russe is regarded as a particularly desirable one. He has been engaged for a number of years in the exportation of Southern hardwoods to Europe and is familiar with every detail of this business. It is expected that he will be able to render the executive committee particularly valuable assistance, not only in connection with the opening of markets for hardwood lumber and lumber products but for other commodities as well.

Arrangements are being perfected here for the entertainment of the National Lumber Exporters' Association, which will hold its annual in Memphis beginning January 21, next. A committee consisting of W. H. Russe, John W. McClure and C. B. Dudley, has been appointed to make the necessary arrangements for the entertainment of the visiting delegates, who are expected to number about fifty. No definite program has been arranged but it is understood that considerable attention will be given to the proposed advances in freight rates on the part of the railroads and to the situation created by the war in Europe.

The Southern Hardwood Traffic Association will hold its annual meeting January 5 and the election of officers for the ensuing year will take place at the same time. President Burgess has already announced two nominating committees to select candidates, as follows: F. B. Robertson, chairman, O. M. Krebs and W. A. Ransom; and W. S. Darnell, chairman, Jas. E. Starke and C. D. Hendrickson. These committees are expected to make their reports between now and the end of the year and the election will be a quite spirited affair as keen rivalry will prevail as a result of the fact that there will be two candidates for every position. In addition to the election of a president and first and second vice-presidents, five directors will have to be chosen. There are fifteen members of the board and, according to the constitution, ten of these hold over each year and five more must be elected.

The Kennedy Heading Company, in New South Memphis, is now operating its plant at full capacity. It was run only partially for quite a while following the outbreak of war in Europe.

Ocean freight rates continue to advance on both lumber and cotton, and exporters of both commodities are having their troubles. However, it may be noted that cotton exports are sharply on the increase while lumber exports are particularly small. This is due directly to the fact that cotton is much more wanted than lumber. Some of the exporters of the latter say they are meeting with a quite restricted call for southern hardwoods and that they see little prospect of any business of consequence until ocean freight rates are much more nearly normal than now.

B. C. Tully, son of C. J. Tully, vice-president of the Anderson Tully Lumber Company, was elected secretary of that company. H. B. Anderson, son of S. B. Anderson, president, has been chosen treasurer. These two gentlemen succeed W. Brown Morgan, who resigned as secretary and treasurer last April to become president and general manager of the Morgan Veneer Company, with plant and headquarters at Pine Bluff, Ark.

The business men of Canton, Miss., are negotiating with Mr. Rhymes of Crystal Springs, Miss., regarding the establishment of a big box plant at the former point. He is the owner of about 12,000,000 feet of gum timber in that section. Arrangements have progressed far enough to make the outlook for the establishment of the plant very bright.

While direct exports of lumber are quite small, there is a great deal of southern hardwood going indirectly to Europe in the shape of packing boxes and tight barrels. The manufacturers here are selling boxes, made largely of gum, to the big packing houses for use in sending meat and other packing house products to the warring nations. At the same time manufacturers of tight barrels report a substantial increase in demand for barrels to be used in the handling of export shipments of both cotton seed oil and lard. The latter are in fact now enjoying a good volume of business and are running their plants on full time.

John M. Pritchard, secretary of the Gum Lumber Manufacturers' Association, is authority for the statement that he is now preparing a booklet in the interest of red gum which will be off the press in a few days. He says this will contain cuts of several men prominently identified with gum and fac-simile letters from large consumers who are much pleased with the results following the use of this lumber. It will contain a number of striking facts in connection with gum lumber that will, it is hoped, materially accelerate the growing interest in the material. Copies of this booklet may be obtained by addressing Mr. Pritchard whose offices are in the Memphis Trust building.

< NASHVILLE >

The Tennessee Railroad Commission has dismissed the petition of the Nashville Lumbermen's Club and Nashville Business Men's Association, complaining against alleged discriminatory local rates. The complaint averred that the mileage rates on logs and timber between local stations and junction points, including Jackson, Martin, Union City, Gibbs, Paris, McKenzie, Rives and Somerville, gave unreasonable advantage and preference to these junction points. After the petition was filed various operators in lumber and timber products intervened, and resisted the movement to have the rates on lumber and logs changed. A vast amount of testimony was submitted, including comparison of the local rates in Tennessee with rates on lines in other states. From the proof it was shown that there are 531 timber industries located on the lines of the railroad in Tennessee, 235 of which are sawmills. It is pointed out that the junction points enjoy certain advantages as to their proximity to Memphis, Nashville and Chattanooga, while the larger points enjoy certain advantages on outbound rates. The intervenors averred that the relief sought would drive them out of business. The commission holds that the proof does not show that the rates are unreasonable. The policy of the railroad in adjusting its rates so far as to foster business at all points is taken into consideration, and recognizes the principle that the railroad has a right to make the inbound rate lower when it will get the outbound haul. The commission holds that there is no unjust discrimination. The Lumbermen's Club has filed a petition for a rehearing in the case, setting up various new matters.

The Nashville Builders' Exchange has elected the following officers for next year: James A. Daugherty, president; J. W. Patrick and Joseph H. Peters, vice-presidents; William F. Holt, treasurer; Lee Parrish, secretary. R. T. Creighton, who has been president, declined re-election on account of pressure of private business.

< BRISTOL >

E. H. Walker has purchased a good sized area of hardwood timber near Clinchport, Va., in Scott county, and has installed two circular mills, which are now running full time. He will soon begin shipping lumber to the market from the new operations.

The Bristol Door and Lumber Company has enough orders booked to keep its mill busy until spring. The company has run regularly practically all year and reports the outlook for next year as encouraging.

E. H. Wilkinson of the Kingsport Lumber Company was here this week and reports that the company will begin the operation of its new mill at Kingsport as soon as business improves. A new railroad has

been installed. The company has purchased the Preston tract of timber. The Peter-McCain Lumber Company reports a splendid outlook for business. It has just been compelled to turn down an order for 1,000,000 feet of hardwood lumber, from an old customer, because its yard stock is low. The company has acquired a new timber supply from which it will begin drawing next year.

The stocks on the yards in this section are probably not more than twenty-five per cent of the amount usually carried. It is thought that the action of the manufacturers in promptly curtailing the output of lumber will hasten the improvement of prices.

The R. C. Duff Lumber Company is operating its band mill at Duffield, Va. The company has about 5,000,000 feet of stock on its yards at Duffield and is shipping out considerable lumber.

The Lovelady Lumber Company of Philadelphia, has about completed its new mill at Jasper, Va., on the line of the Virginia & Southwestern railway, near Bristol.

The Honaker Lumber Company is preparing to rebuild its mill near Honaker, which was recently destroyed by fire.

< LOUISVILLE >

Harry E. Kline, president of the Louisville Hardwood Club, has appointed his committees for the year. They are as follows:

ENTERTAINMENT, PUBLICITY AND PROGRAM: John Churchill, Churchill-Milton Lumber Company; G. D. Crain, Jr.; Preston Joyce, W. P. Brown & Sons Lumber Company; D. E. Kline, Louisville Veneer Mills.

FINANCE: C. M. Sears, Edw. L. Davis Lumber Company; Roscoe Smith, Ohio River Sawmill Company; Charles Platter, North Vernon Lumber Company.

TRANSPORTATION: T. Smith Milton, Churchill-Milton Lumber Company; H. J. Gates, Louisville Point Lumber Company; T. M. Brown, W. P. Brown & Sons Lumber Company; J. C. Wickliffe, C. C. Mengel & Bro. Company.

LOGS AND LUMBER: Edw. L. Davis, Edw. L. Davis Lumber Company; E. S. Shippin, Louisville Point Lumber Company; Charles Talbot, North Vernon Lumber Company, and Roscoe Smith, Ohio River Sawmill Company.

BYLAWS: D. E. Kline, Louisville Veneer Mills, and Clyde Smith, Ohio River Sawmill Company.

Much interest was shown in the action of the Kentucky court of appeals in declaring unconstitutional the workmen's compensation law which was enacted at the last session of the legislature. This measure, which put a compensation system into effect January 1, 1915, would have affected every sawmill in the state, and lumbermen were making preparations to comply with it. While the law made it optional with the manufacturer whether he would come under the system or not, it was provided that if he did not, the common law defenses which are usually pleaded would be taken away from him. On the other hand, he could plead these, if he came into the system, against the employe who refused to subscribe to the plan. This was what the court regarded as the essential flaw, a majority holding that this constituted coercion, and that the elective plan was merely nominal. It will be several years, at least, before another law can be enacted.

The Louisville Hardwood Club has decided to join forces with the Southern Hardwood Traffic Association of Memphis in opposing the freight rate advances from the South, as in this way John R. Walker, the regular representative of the association, will have an opportunity to look after the local interests as well. Mr. Walker will come to Louisville January 19 to attend the hearing of the Interstate Commerce Commission and conduct the case for Louisville hardwood men.

After a splendid effort to ward off death, James Elder, a sawmill operator of Dexter, Ind., succumbed to injuries received at the mill, the end coming at the Sts. Mary and Elizabeth's hospital in Louisville. Mr. Elder slipped and fell against the circular saw in the mill, his right leg being almost cut off, and other portions of his body being injured. He was taken in a buggy to the Ohio river, where a skiff was secured and he was rowed across to the Kentucky side. A Henderson train for Louisville was caught, and a telephone message ahead resulted in an ambulance being at the station when the train arrived. The lumberman was taken to the hospital and his leg amputated in the hope of saving his life. He apparently withstood the operation in good shape, but the shock and loss of blood proved too much for him, and he died two days afterwards.

J. R. Burbank, manager of the E. L. Hughes Lumber Company of Louisville, has been elected a member of the Louisville Rotary Club, one of the leading business organizations of the city.

Much activity in the purchase of railway ties is reported from various points in Kentucky, the Queen & Crescent, with general offices in Cincinnati, having purchased a large quantity in eastern Kentucky.

The Day Lumber & Coal Company is having a big boundary of poplar timber near Mayking, Ky., logged, the logs to be cut up at the Jackson mill. The timber is said to be about the biggest remaining undeveloped in that part of the country.

George M. Adams has purchased a Frick sawmill outfit for installation at Sandlick, in Letcher county, Ky.

J. W. Carter and others plan to establish a lumber yard at Middlesboro, Ky.

< MILWAUKEE >

The McDonough Manufacturing Company, Eau Claire, Wis., is experiencing one of the finest runs of business since its establishment, and its big plant in Eau Claire is working overtime to get the desired material out on schedule. Most of the business is from the southern hardwood dis-

tricts and the orders are most encouraging because of the absence of bookings from that district for a long time. The latest order is for a double band mill and was forwarded by J. D. McDonough, southern representative, who has now sent three large orders for new mills within two months' time.

The Albrecht Manufacturing Company, Kewanee, Wis., is building a new dry kiln and adding more lumber storage sheds. The present kiln will be rebuilt into a warehouse.

The C. F. Kade Fixture & Showcase Company, Plymouth, Wis., will practically double the size of its plant during the winter and spring. Two new woodworking buildings will be erected, in addition to two dry kilns and a warehouse.

The C. H. & E. Manufacturing Company, Milwaukee, Wis., portable saw-logs and other power equipment, has broken ground for a new plant to cost \$25,000 and he located at Clinton and Mineral streets.

That the state's power to regulate railroad rates cannot be delegated irrevocably to a railroad corporation is the decision of the supreme court of Wisconsin in the case of the Menasha Woodenware Company vs. Minneapolis, St. Paul & Sault Ste. Marie Railway Company (Soo Line). The Soo Line attempted to hold the Menasha company to a rate contract which was made prior to the passage of the law providing for and giving powers to the Wisconsin Railway Commission. The court declares the contract is automatically abrogated by the enactment.

The Hatton Lumber Company, New London, Wis., placed its big mill in full operation during the first half of December and expects to run with day and night crews for several months at least. The mill was closed down for two weeks late in November for overhauling and repairs. In the meantime a large cut accumulated in the yards, which is being cut as rapidly as the extensive mill facilities will permit.

The J. S. Stearns Lumber Company's planing mill at Odanah, Wis., was damaged about \$25,000 by fire on December 10. High winds and zero weather caused nearly the entire destruction of the plant. It is expected that the mill will be rebuilt without delay. The company operates a large mill at Washburn, Wis., and recently made a heavy purchase of timber in northern Michigan to supply this plant.

The late M. H. Wheeler, pioneer lumberman of Neenah, Wis., left an estate valued at \$350,000, according to the will which has just been filed. The principal beneficiaries are two daughters, Mrs. Nelson Holbrook, Neenah, and Mrs. H. W. Stewart, Amherst Creek, Wis., and a son, H. E. Wheeler, Chicago.

The Rice Lake Lumber Company, in which O. H. Ingram of Eau Claire is a principal owner, has recently made several large sales of rough and dressed lumber for shipment east and south. The sales aggregate more than 1,000,000 ft. of fir and hemlock. Mr. Ingram said regarding the sales: "There can be no doubt that activities everywhere will take a big spurt after January 1. For instance, eastern buyers of fir are offering \$1.50 premium for delivery after January 1 and \$3.00 for delivery after February 1."

◀ DETROIT ▶

S. F. Derry of the Derry Lumber Company, Detroit, in discussing the year's business, says that when the total is figured up the year's trade probably will prove to be better than is expected at first thought. "The sudden depression immediately following the war, owing in part to the suspension of exportation and also in part to the program of curtailment some American manufacturers adopted, has had a tendency to make trade seem worse than it really is," said Mr. Derry. "I believe that now, however, there is a better feeling, which is backed to some extent by an increased business. Immediate prospects are better than at any time since the depression resultant to the war."

A sixteen-acre tract of oak, one of the finest in the vicinity of Dowagiac, has been purchased by William M. Vroman, Dowagiac timber buyer.

S. W. Clements, general superintendent of the Dollar Bay Lumber Company of Dollar Bay, will soon place contracts for logs for next season's operations. The company probably will contract for from two to three million feet and if conditions warrant an increase will be made. The company has timber available for summer logging if it is needed.

Ewing & Son of Chelsea are shipping heavy trucks and sleighs to Elm, Mich., where they will cut considerable timber this winter.

William Chandler, vice-president of the Munising Veneer Company, died recently at his home at Sault Ste. Marie, Mich. He was a pioneer at the Soo and in addition to his lumber interests was a bank director and vice-president and general manager of the Edison-Sault Electric Company and also vice-president of the Chippewa-Edison Company.

The new mill which the Stack Lumber Company is erecting at Masonville, in the upper peninsula, is now well under roof. Rapid progress has been made on the construction. During the winter months all machinery will be installed and the mill will be in readiness for operation early in the spring.

Fred L. Green, president of the Ypsilanti Reed Furniture Company of Ionia, is now in Europe trying to obtain a supply of reeds to operate the company's furniture plant at Ionia. Unless he obtains the reeds the plant will soon have to suspend operations notwithstanding the fact that it finds a good market for its products. The fiber which Mr. Green must obtain is grown in China but is treated by a secret process in Germany.

The Cummer Manufacturing Company's plant at Cadillac has resumed operations after an idleness of several weeks. The company is now manufacturing crates and boxes for the spring trade.

The Iron Range Cedar & Lumber Company has about forty men and a number of teams logging at its camps near Pentoga. Repairs have recently been made to the saw mill at Pentoga and it is expected that not long after the first of the year the mill will be operated.

The Copper Country Commercial Club, an upper organization which induced the Kelly Chair Company of Grand Rapids to locate a plant at Hancock, Mich., is now negotiating with German toy manufacturers

in an effort to obtain a toy factory for the upper peninsula. The abundance of hardwoods and excellent shipping facilities are among the attractions of the upper peninsula.

The Helena Land & Lumber Company has been formed at Escanaba with John K. Stack, Jr., as president. The company has acquired a large tract of timber near Little Lake, on the Northwestern railroad and will erect a sawmill in the spring. A logging railroad five miles long is now being built into the timber.

The Hardwood Market

< CHICAGO >

The local situation is characterized mainly by inactivity resulting from stock taking, but with very distinct and highly encouraging suggestions of business for the first of the year, when the necessary repairs are completed and inventory taking is over.

A pretty close study of the situation locally develops that the average factory yard is not at all well stocked, and that most of the factory buyers are making definite plans for filling up broken lines as quickly as possible. Of course a great deal depends on the furniture exhibits, but as a general thing there is a very distinct feeling among the furniture people that these shows are going to develop a surprisingly good line of business.

The local yards for the most part have not been buying in any quantities, and are not now doing so as they in turn are holding up awaiting action of their customers.

The building situation is not unduly inactive and shows a distinct evidence of a general awakening. When this is effected, and with the factory trade demanding fair quantities of lumber, the situation will be much more favorable.

As a matter of fact local business has been quite a little better during the past few weeks and a definite price level seems to have been reached with a very likely probability that future development will be much more favorable.

< NEW YORK >

Nothing of interest is doing in the local lumber market. Sales are at a low stage and no large amount of business is expected for the next few weeks. It is safe to say that stock taking will reveal a generally scarce supply on hand and if the ledger is favorable there should be some good demand for early January. Prices are so irregular that all discussion of this phase could well be dispensed with. Conservative houses are holding firm but there are many who are ready to move lumber at ridiculous prices.

The stock exchange has resumed operations on a basis almost normal and more activity in the money market may now be looked for. The rate decision is another feature of some concern and will indirectly have some influence on the local lumber market, though this will, of course, be somewhat delayed. The building outlook is fair in some sections, principally in the suburbs and this will tend to keep the market engaged to some degree. It rests largely with the dealers whether they make any money on the business offered; competition is one thing and price cutting is another. The former is an element that can be met while the latter is a disturbing factor which results in ruin and demoralization.

< BUFFALO >

The hardwood market is on a quiet basis, with little stock moving for immediate shipment. This is the usual state of affairs at the end of the year and there is an optimistic spirit as to the prospects for business soon after the year opens. The present state of prices is unsatisfactory, but there is not quite so much lumber offering from the mills as a short time ago and it is felt that prices must stiffen before long. Some people believe that within sixty to ninety days the market will be a great deal stronger.

Plain oak and maple are as usual among the woods chiefly in demand, though quantities selling are not at all large. Thick maple has been doing better at some yards. Quartered oak is firmer than most other woods and some dealers have been moving quite a fair amount of stock. Poplar has been quiet for a number of weeks. White ash is said to be a little less common than a few weeks ago. Brown ash is one of the specialties in pretty good sale. Cypress is firmer in price and some dealers are selling more of it at present than a month ago.

Building operations have been interfered with by stormy weather as well as the lack of available funds from banks to carry on operations. Very few plans are being filed at present and the last few weeks of the year are running behind a year ago. Still the year's showing has been pretty fair, as compared with other recent years.

< PHILADELPHIA >

As 1911 with its disjointed trading nears its close, the closing of books and taking off of balance sheets, as customary at this time, is in order and until complete, buying will be restricted to only actual requirements.

Notwithstanding various impediments which have interfered with trading during the last twelve months, a comparison of the year's business with that of 1913 will prove a revelation. A serious deflection in business generally has in most cases yet to be substantiated. There has been no distinct activity in trading during the last fortnight, but the improved methods of buying indicate that the buyers are beginning to realize that in the near future an upward move will cause a stiffening of prices, as stocks are getting lower and the hardwood millman is not inclined to make any further sacrifice of his profits. A large number of orders are being booked in various other lines, due to the foreign war feature, which has resulted in the starting up of numerous large mills and factories. As long as the war continues soldiers must have clothes and food; the contesting countries the required equipment; lost ships must be replaced and a thousand other leakages replenished. On account of the lack of mechanics and the laborers who are now in the front these necessities must be supplied and as soon as possible by unfettered markets, and as this country has the material, the factories and the labor, it is only logical that orders must come here. The trade is thoroughly alive to the situation, business is being conducted on efficiency plans and everybody is saving money wherever consistent, in consequence of which the trade will have more money to spend when the time comes for spending. The local lumber business is virtually a unit in opinion that good times are coming soon, and a cheerful Xmas spirit is by no means exercised as has been gloomily predicted. If spirits are light it may be approximated that trading with the advent of the new year will assume a decidedly more buoyant aspect.

< PITTSBURGH >

The year is winding up in Pittsburgh with some very encouraging announcements and some very discouraging totals of business done during 1914. The rate decision made known yesterday is perhaps the most favorable omen in sight and lumbermen are banking much on the improvement in general buying sentiment which will result from it. The industrial situation in this district is much improved the past two weeks. Many steel plants are putting on larger forces, the cold snap has put more life into the coal business and the window glass and plate glass industries are verging on a boom. All kinds of manufacturing activities show more life. As to the business done the past year it is generally conceded that the totals of sales of Pittsburgh firms will be from twenty to thirty per cent lower than in 1913. The totals of net profits derived from such business will fall even lower in proportion, for competition has been very keen and losses from different causes have been heavy and frequent. All lumbermen are in a hoping stage. They believe that there is going to be a sharp revival in buying after the first of the year and if the building situation shows up well in January they look for much business within a very few weeks.

< BOSTON >

The volume of business being transacted in hardwoods is still small, and the amount of inquiry current is naturally light. The prices quoted and paid continue in a very uncertain condition and the apparent supply of lumber available is evidently large, especially in the middle and lower grades. One of the most important factors influencing this market is the great number of mill stock lists forwarded to dealers and manufacturers. While these lists seldom show very large piles of high-grade stock on hand, the aggregate of so many lists in all grades is so extremely large that they have the effect of restraining the buyers instead of encouraging them. While the submission of statements of large stocks is expected to influence the purchasers favorably toward such a supply, it has the result of producing great caution and a disposition not to lay in any stock whatever. There are, of course, many corrective features such as the great decrease in sawing, the necessity of buying frequently instead of heavily and the almost universally acknowledged improvement in business about to come, all of which have operated for the prevention of unreasonable disturbance of values. The market, nevertheless, is not uniform nor satisfactory for either the dealers or the buyers, and in a condition which the trade as a whole believes will not be remedied by lowering prices.

< BALTIMORE >

With the end of the year close at hand, little is to be expected of the hardwood trade at this time. The last two weeks have been a season of quiet, with the demand limited, but with the offerings by no means so urgent as might have been supposed under the circumstances. The business appears to have a good undertone, so that even though the quotations are more or less uncertain and take a rather wide range, a feeling of hopefulness prevails. This spirit of expectation has been growing of late, and the members of the trade will close the old year firmly persuaded that much better results may be looked for in the near future. Much is anticipated from the decision of the Interstate Commerce Commission on the application of the railroads for an increase in the rates. One of the effects of the ruling ought to be a resumption of buying of materials by the transportation lines. This should also cause a change for the better in other divisions of the trade, especially as the stocks of lumber are by no means heavy and very little would be required to emphasize a scarcity. The mills have been holding down their production

and few of them have large accumulations of stocks. This applies to practically all departments. For the present, of course, consumers will go slow and hold back as much as possible, not caring to make large additions to their obligations, but after the first of the year a letting out is almost certain to occur.

The export situation is still clouded, of course, and as long as the war lasts interference with the foreign movement must be expected. But there is also a prospect that such needs as cannot be postponed will manifest themselves, the movement at this time being probably at its lowest level. Viewed from every angle, therefore, the outlook for the trade is encouraging, and preparations to meet a larger demand are in order. Some of the woods, such as certain grades of chestnut and poplar, are inactive and rule low in price, but the entire list is likely to benefit from the revival that is in prospect.

< COLUMBUS >

The hardwood trade in Columbus and central Ohio was fairly quiet for the past fortnight, due to a number of causes. The most important was the war existing in Europe, coupled with the business depression. Another cause for the quietude is the approach of the semi-annual inventories and as a result both dealers and factory purchasing agents are loath to increase stocks at this time. On the whole the tone of the market has been satisfactory and future prospects are not at all bad.

Dealers' stocks generally are light and there is no disposition to increase them at this time. They have been following the policy of buying from hand to mouth, as it were, and are not taking any chances on the future. Dry stocks in the hands of mill owners are not very large and this is expected to help in maintaining quotations.

Buying is pretty evenly divided between the yard trade and factory demand. Factories engaged in making furniture and vehicles are the best customers. Implement concerns are also coming in the market to a limited degree. Shipments are coming out promptly, but collections are very bad.

Building operations which had been fairly active up to the middle of December fell off rapidly because of the approach of cold weather. Outside work has been effectually stopped. Quartered and plain oak is rather firm and the volume of business is as much as could be expected. All grades are moving uniformly. There is also a good demand for chestnut, especially sound wormy. Ash and basswood are in fair demand, while poplar is gaining in strength. The wide sizes of poplar are rather quiet. Other hardwoods are unchanged.

< CINCINNATI >

Lumbermen are convinced that conditions are fast righting themselves and that it will not be many days before the trade will be in a decidedly improved condition. Factories are increasing output slightly in most instances and a few of them are running full time or better, with best of indications for continuing on present basis. The furniture trade alone seems to be backward and it is expected that this branch of the lumber industry will improve in a short time. Inquiries are numerous from many sources and lumbermen are making prices that are considered on a par with recent quotations and for early deliveries. None of them care to quote for delivery later than thirty days off, expecting much better trade conditions by that time.

Right now there is more interest being displayed in plain oak than for several weeks, confined mostly to the better grades, the low grades still being a little off in demand. The call for quartered oak is increasing, but like plain oak, good grades sell best. The better grades of poplar and cottonwood are moving slowly but dealers are holding prices up and claim it is only a question of a short time when demand will be good for this stock. There is a very good request for ash and maple; this is especially true of stock thicker than inch, for which good prices are obtained. Sap gum in all grades is in active demand but the reverse is true of red gum except in the low grades. Chestnut does not improve much and grades other than sound wormy and No. 3 are quite plentiful, call for the latter grades being fair and rather on the increase.

Building operations are at a close, as is usual at this time of the year, and owing to enforced inactivities in this line during the last few months, due to financial stringency, little was done in the way of building development, although the demand for homes was very good. Consequently better banking conditions, making financing much easier, lead builders and large real estate operators to venture opinions that business in this line will be extra good early in the spring.

< INDIANAPOLIS >

The hardwood situation in this territory is daily showing improvement, but normal conditions cannot be expected for some time. Prices are steadier, the demand slightly better and inquiries are increasing in number.

The total volume of business for the year has been at least twenty-five per cent less than that of 1913. The outlook for the coming year, however, is fairly encouraging. Dealers are more optimistic and are doing some buying for spring.

There is also a slight improvement in the veneer situation. The de-

ground is a little better, but manufacturing operations are not being resumed to any great extent. There is a tendency to work off stock on hand before making more.

MEMPHIS

The South is in the midst of unusual weather for this time of year. It began snowing December 12 and the ground has been pretty well covered since that time. It is now raining all over this territory and, while the snow has disappeared, the ground is thoroughly soaked with water from the rain and the melting of the snow. It is practically out of the question to make any progress whatever with logging operations and those manufacturers of hardwood lumber who have not already made arrangements for their timber supply are practically at a standstill. Fortunately, those who are making an effort to operate their plants have a moderate supply of logs on hand and they will probably be able to run for a while. The point which is being emphasized by hardwood interests here, however, is the impossibility of conducting fresh logging operations and the certainty of exhaustion of supply when the present cut has been converted into lumber.

It is probable that there has been some increase in the amount of hardwood lumber being produced in Memphis during the past three or four weeks. Several firms here have resumed operations either in whole or in part and it is estimated that the output is something like thirty-five per cent of normal. The Gayoso Lumber Company is running day and night in New South Memphis. The Memphis Band Mill Company is also running again. One or two other firms in that part of Memphis have put their machinery in motion again. There has also been some increase in manufacturing operations in North Memphis, including the plant of Russe & Burgess, Inc., and the Green River Lumber Company. But even with this increase in output there is no gain in stocks. This is due to the fact that shipments have been on an increasing scale during the past few weeks and that any excess in production has been easily taken care of thereby.

Business in hardwood lumber at the moment is comparatively quiet. This is due to the close proximity of the holidays. The end of the year is near at hand and the taking of inventories has already begun among consuming and distributing interests. As a consequence a great deal of lumber which has been sold during the past few weeks has been ordered held up until after the first of the year. This condition nearly always obtains at this season and has occasioned no particular surprise this year. As a general rule there is a more optimistic feeling among producers of hardwood lumber. They believe there will be a decided increase in the volume of business after the new year and that prices will show an upward tendency. The known scarcity of southern hardwoods, together with the lack of anything approximating the usual supply of timber, is looked upon as a strong potential influence in bringing about better values. No boom is expected. Such a development would indeed occasion very great surprise if it materialized, but there is a strong disposition to look for a nearer return to normal conditions so far as the domestic situation is concerned. There is very little prospect for foreign business of consequence, especially with Europe, for the reason that freight room is not only very scarce but it is also commanding an abnormal premium over anything ever witnessed by hardwood interests here.

The position of the various items has shown no particular change. There has recently been more demand for plain oak than heretofore and prices on this are somewhat firmer. Plain oak declined more as a result of the unsettled conditions following the European war than quartered oak and it is much more disposed to recover than the latter. The lower grades of cottonwood and gum continue in good demand as the box manufacturers are still operating on full time. Prices are perhaps a shade firmer on this class of lumber but there has been no special advance recorded. More inquiry is reported for red gum and there has been some increase in sales of this lumber. Sap gum is also moving at a reasonably rapid rate. The demand for ash is fair, with offerings somewhat restricted. A very good call is noted for cypress and shipments of this lumber have been relatively large recently. The upper grades of cottonwood are in only moderate demand.

NASHVILLE

There have been no important features in the hardwood lumber market the past two weeks. The holiday quiet is now being experienced with light volume of trade. Shippers have had some orders all along, but they have been small, showing that buyers have been pursuing a hand-to-mouth policy. Local hardwood men favor maintaining prices, as they do not think business can be forced by cutting values. The demand has been for oak, ash, poplar, chestnut and other lines. Local building is very quiet, making retail trade small. Furniture, flooring and box factories have been slowing up for the holidays. Local firms look forward confidently to better business next year.

BRISTOL

The situation in this section is decidedly more encouraging within the past few weeks. The hardwood manufacturers and dealers are now confident that business will show marked improvement after the first of the year. This conviction is causing several large manufacturers

to go ahead as rapidly as possible with the installation of new mills. confident that by the time they are ready to run, business will have improved sufficiently to justify their operation. A number of large mills in this section are running full time but the majority are still idle, having closed down until spring.

< LOUISVILLE >

Looking back over 1914, hardwood men must admit that conditions were never altogether favorable to the business, though, had not the war intervened, trade during the latter half of the year would have been excellent. Last year closed weak, and the uncertain condition of business continued over into 1914, with prices generally unsatisfactory and the demand below normal. By the middle of the year, however, an improvement began to be manifested, and it was thought that the fall would be sufficiently good to make up for the depression of the previous half year. However, the development of war in Europe in August put business down and out again, and it has been a hard struggle all along the line since then. Once more, however, conditions are improving, and sentiment is now more optimistic than it has been at any other time this year. Lumbermen feel that the worst is over, and that any developments from now on must necessarily be for the better. While buying during the past fortnight has been light, practically all the business handled has been of the rush variety, indicating that stocks are low; and as soon as trade generally opens up, there should be a great rush for lumber, with accompanying strengthening of prices.

< ST. LOUIS >

A general quietness prevails in the hardwood market and this condition is likely to prevail until after the first of the year. Buyers are not placing orders unless they are compelled to do so. The result is that the yards are devoting their time to invoicing the stocks. Every indication points to a general revival of trade soon after the first of the year and an advance in prices is looked for about that time. Most of the present demand is for plain and quartered oak of the higher grades. Walnut and poplar and ash are moving a trifle better than they did. Some inquiries for cottonwood and choice red gum are being received. Cypress is beginning to move a little better than it did and the future for this item looks good.

< MILWAUKEE >

Most business houses, lumber concerns and lumber consuming industries included, are now in the midst of their annual inventories, and trade is naturally a little quiet. Wholesale lumbermen are inclined to believe that after the inventory taking has been completed, most concerns will begin to realize that their lumber stocks are low and that it will be necessary to place larger orders if they expect to be in readiness for the spring business. It is confidently expected that the yard trade will show much improvement after the opening of the new year and that dealers will begin to place their orders for spring delivery.

One of the most hopeful signs is the fact that some wholesalers, even at this early date, are beginning to receive inquiries from the factory trade. This would indicate that stocks in most hands are low and that buyers, especially in the factory field, are inclined to forestall a possible advance in prices after the opening of the new year by placing their orders at prevailing quotations.

Building operations in Milwaukee are picking up slightly, although not much activity is expected until January. During the past week there were 42 permits issued for the erection of buildings to cost \$108,880, as compared with 41 permits and a building investment of \$71,540 a year ago. Building Inspector Harper admits that the total building record for the past year will show a big falling off, but he is confident that there will be plenty of activity next spring. He says that many large building projects have been carried over until spring, in the belief that general business will show more improvement by that time. Lumbermen are inclined to be as optimistic as the building inspector and they are confident that business will be all right soon.

This feeling of increased confidence in regard to conditions during the next few months is also finding expression among many of the large lumber manufacturing concerns of Wisconsin. Officials of several of the large companies have announced that they are more optimistic and that they will increase their logging output over the amount estimated a month or so ago. Really large orders received by some of the northern Wisconsin concerns of late have helped along this feeling of optimism.

< DETROIT >

A general feeling of optimism among the Detroit hardwood dealers is backed up to a fair extent by an increased business. Inquiries are fairly strong and in several quarters are reported to be materializing with a regularity that is encouraging.

Among the lines moving most are oak and beech. Maple has been in least demand since the slump became permanent in the hardwood market. Prices remain fairly near the low level found several months ago. It is a consensus of opinion among Detroit dealers, wholesalers principally, who are familiar with conditions in the other markets throughout the country, that Detroit has suffered to a less extent than many other centers.

YOU SHOULD USE THE GIBSON TALLY BOOK

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—4½x8½ inches in size.

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket.

Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired.

Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs. Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability, convenience, accuracy, and for systematizing the inspection and measurement of lumber

Patent applied for on covers. Copyrighted, 1910. Triplicate Tally Tickets patented.

PRICE LIST

Aluminum Tally Covers, each	\$ 1.00

Perkins Glue Fast Becoming the Standard For All Veneer Work

Manufacturers who use glue for veneer laying and built-up panel work are rapidly realizing the advantages of a glue that does away with the hot, bad-smelling glue room necessary with hide glue and are adopting the modern and efficient

Perkins Vegetable Veneer Glue

because it does away with the cooking process, being applied cold. It is equally as efficient as hide glue and at a saving of no less than 20 per cent over hide glue costs. It gives off no bad odor and may be left open a number of days without souring or in any way affecting its adhesive qualities.

Every shipment is absolutely uniform.
The use of Perkins Glue does away

with blistered work and is affected in no way by climatic changes, thus increasing the advantages of manufacturers, who must ship their goods to hot, cold or damp climates.

Unsolicited testimonials from hundreds in all glue using lines praise its efficiency and economical application.

Write us today for detailed information.

Why Struggle Along

with an old nuisance of a drying system that's perpetually balking—kicking back—laying down—spoiling a scandalous percentage of your product?

The Standard Drying System

is so adaptable—the drying conditions so completely under control—the apparatus and construction of so high a quality—that the drying is done just right, without fuss or bother, no matter what the variety of the stock.

Write for the catalog and new list of users. Address: The Standard Dry Kiln Co. 1534 McCarty St. Indianapolis Ind.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

ST. FRANCIS BASIN OAK

THE GALLOWAY-PEASE KIND

It is a peculiarity of our timber that, growing beyond the over-flow district, it matures slowly—hence has even texture and is soft and light with uniform color.

Kiln dries without checking. No honey-combing, and minimum shrinkage.

Total absence of injurious insects insures sturdy, clean growth.

Our band mills cut oak only—hence filer and sawyer get best possible results.

SPECIAL ITEMS ALL BAND-SAWED STOCK

150,000 ft. 4/4 Firsts and Seconds WHITE OAK

Q For items of Hardwood Stock or Hardwood Machinery, you will find it advantageous to write our advertisers. Get in touch!

A floor to adore

For thirty-three years Wilce's Hardwood Floor-ing has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface floor-ing, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

NASHVILLE

THE LOGICAL PLACE TO BUY HARDWOODS

THE following is a list of stocks offered to the consuming trade by the hardwood lumbermen of Nashville. The character of the timber from which Nashville hardwood men secure their stocks places them in a peculiarly strong position as far as quality of lumber is concerned. Nashville lumbermen have always been noted for their strict adherence to all terms of sale, and in short have an enviable reputation for making good both as to the quality of lumber and as to grading.

The members of the Nashville hardwood trade solicit your attention to these facts and an opportunity of demonstrating their truthfulness.

American Black Walnut The Popular Favorite

¶ The contention of those who knew, that once the public were given a chance to express its approval, American Black Walnut would promptly return to popular favor, is being borne out by the event. Walnut is taking—has already taken! At the January furniture shows there will be sixty-six exhibits containing numbers made of this wonderful wood. Factory men who have not arranged to use it are overlooking the "one best bet" for 1915. Don't be the last to climb into the bandwagon!

No. 6

Review and Outlook

General Market Conditions

THERE IS NOTED ELSEWHERE in this issue the opening of the mills of two of the largest hardwood manufacturing institutions in the United States. The policy was adopted after mature consideration by the directorates of the respective institutions in regular meetings, and it is significant that in each case the men who are responsible for shaping the policies of these firms are men who are closely in touch with the varied mesh of business and whose views are not narrowed to perception of problems facing the lumber business alone. Hence this note of optimism has an even deeper meaning than if the companies in question were one-man institutions.

HARDWOOD RECORD has contended for many issues that the thing most vitally lacking in business is sufficient confidence. By far the most valuable effect to the remainder of the trade from the opening of these two plants, involving many million feet of production, will be the general tendency to increased confidence with other institutions. It can be supposed, with utter confidence in the correctness of the belief, that these two firms have made their decisions only because they feel that conditions warrant. It can be supposed with equal belief in the correctness of the supposition that the men behind these firms are in a position to so judge conditions as to make their opinions fully authoritative.

At present there is a season of inactivity as far as the furniture factory trade is concerned, due to the recent opening of the furniture exhibits in different parts of the country. Even under the best of conditions it is not possible to sell furniture men any quantities of raw material until they see the probable trend of demand for their own goods. It will not then be possible to secure orders of any magnitude for hardwood lumber, veneers or panels for this class of trade until the probable condition of furniture sales is fairly established by the attendance at the shows and the activity of orders.

It is frankly admitted by some of the leading manufacturers in the furniture trade, however, that they feel altogether optimistic regarding the outcome of the sales, and further, that with fair business resulting, they will be in a position to purchase their entire stocks of lumber. Until that point is established, however, one way or another, it is practically useless to look to this class of trade for very much in the line of hardwood orders, and the reasonableness of this condition should be fully appreciated.

As indicated by statistics of commercial and industrial development of late, the money situation is easing considerably. However, the banks have not yet done their part to put the country on its feet and in many cases are being severely criticised for their continued high rates of interest and for their unreceptive mood as far as backing is concerned. The interest rates are of course considerably

more favorable than they were for several months, but even at that it is hardly a pleasing comparison to note the rates prevalent in this country, which presumably is enjoying fair business, and the rates in effect in England where money can be had at as low as five and a half per cent, and for year periods at that.

Considerable disappointment has been expressed in many quarters at the lack of active buying on the part of the railroads of the country immediately following their successful fight for increased rates in the eastern territories. This disappointment has hardly been justified as there has hardly been sufficient time for a fair alignment of purchases, as it hardly seems possible that the railroads should have gone to the expense of shaping up policies for increased expenditure before they knew they would have increased revenue to take care of such added outlays. It seems that it would really take considerable time to spend \$25,000,000 to \$30,000,000 intelligently, and getting right down to it that is exactly what the railroads are up against.

The average commercial house in any of our big cities counts probably more on printer's ink than upon any other means of getting in touch with its customers. Whether it has men on the road or not it considers the publication of catalogues and other sales literature an absolute essential to business advancement. During the past few months the stagnation of business has been more clearly and conclusively demonstrated by extremely slack times with the printers than in any other way. Several of the largest printing institutions of Chicago had closed up their plants entirely on certain days of the week on account of the absolute paucity of orders for this class of literature. There comes encouraging word from this source during the past few weeks to show beyond a doubt that this condition is rapidly being remedied, and that the general tone of increasing confidence, which appears to be spread over the entire country, has made itself felt in a concrete and result-getting way. Printers are now doing a great deal more work than they did during the excessively dull period, and it is impossible to put any other construction on this condition than to suppose that it indicates a return of confidence and increased business.

We have a hopeful sign in reports of building for 1914. Statistics show that there was a loss of only about fifteen per cent in the country as a whole. The average individual probably believed that the falling off in building operations was much more serious than this, and there should be considerable hope in this condition as well as in the fact that building of all kinds is assuming a much more active attitude than it has for several months past.

In the lumber trade, specifically, the tone of inquiries has been much better. They have not been so flagrant mere feelers of

the condition of the market, but in general have seemingly been of a more genuine character. The evident desire on the part of consuming parties to either contract ahead for the entire year's requirements or to order for long-time shipments continues to be received without enthusiasm by the lumbermen. In fact, there are few institutions which have actually consummated such deals, which is to the everlasting credit of the lumbermen themselves.

It has been frankly admitted by the most pronounced optimists that no marked change will be felt until 1915 is fairly well under way. The fact that a new figure has been placed at the end of the date line without an accompanying radical increase in business should not be taken as a discouraging indication. On the other hand, the fact that 1915 is opening with an undeniable strengthening of confidence all over the country should mean a lot. Evidently we are facing the new year with the determination that everyone will do his part to exert that moral influence which alone is necessary to put the country back on its feet in a business way.

The Cover Picture

THE PORT ORFORD CEDAR is peculiar in a number of ways; but in no way is it more peculiar than in its habit of growth. It occupies a small tract on the Pacific coast, at Coos Bay, Oregon, and there it has held its ground since time immemorial, apparently unable to gain another acre. That is remarkable, because it is a tree of extreme vigor within the circumscribed area where it is found. It holds that ground so firmly that only fire and the lumberman's axe can make any impression upon its dense stands. So closely together do the trees stand that on a tract of approximately four hundred square miles, 4,000,000,000 feet of timber are growing. That is nearly twice as much as the estimated stand of white and Norway pine in the whole state of Michigan at present; and that vast quantity is crowded upon an area equivalent to a tract only twenty miles square.

The tree's ability to grow in dense stands is only one of its peculiarities. Still more remarkable is its inability to spread into new territory. It bears an abundance of seeds which are equipped for flight. They make good journeys before the wind; but when they fall outside of the boundaries of the cedar's well-established range, they have little power to maintain themselves. Consequently, the Port Orford cedar has never been able to spread far, except as solitary specimens. A few such have reached the northern slopes of Mount Shasta, a considerable distance inland, and high above sea level.

The cover picture illustrating this issue of *HARDWOOD RECORD* shows a pair of open-grown cedars of this species. They escaped when the great fire of 1854 destroyed practically all the timber on a large area, and have not grown much taller since that time, but have increased in diameter. They have not the form of the forest grown Port Orford cedar which is very tall, with long, smooth trunk. Such trees stand close together where they have not been molested. Instances are on record where from a single acre one hundred thousand feet of logs have been cut. The largest trees are six or seven feet in diameter and from one hundred and fifty to two hundred feet high.

The wood is very durable and has been one of the best ship timbers on the Pacific coast. Vessels built chiefly of it have given forty years of service on the high seas. Sir Thomas Lipton built some of his racing yachts of this cedar.

Few forest trees under cultivation have run to varieties more than Port Orford cedar. Sixty-eight varieties are listed by nurserymen. Freshly cut wood emits a dangerous odor, and some men cannot handle the lumber or work in the mill that cuts it for a period longer than three or four days at a time.

The Building Situation

THE SIGNS OF THE TIMES are closely scanned for indications that the building business is reviving. Hope of such a revival in the near future may help, but it is not sufficient to accomplish the end desired. There must be a tangible basis for the hope before it will be accepted as proof of the coming of a better era in business.

Experienced men who have been looking carefully over the field believe there is sufficient ground for predicting an improvement in the building business early in the present year. Some of these reasons have been set forth in published interviews and may be summarized as follows:

Architects have means of seeing an approach of activity in building before the ordinary observer can discover it; and the belief is general among architects that a revival of building operations is at hand. These gentlemen are called upon, in their professional capacity, to draw preliminary plans and make estimates before knowledge of the proposed operations comes to the general public. In other words, they are in a position to catch sight of the first straws which tell the change in the direction of the business wind. It is declared that the current has now changed toward greater building activity. This is one of the grounds on which the hope of improvement is based.

Building has been slow or at a standstill for some time. That is an abnormal situation. The natural course is for some building to be in progress all the time. If, from any cause, it slacks up temporarily, it must move with greater speed, after it again gets under way, in order to make up lost time. For some months the building activities have been slack. There has been little lessening in the need for new buildings; but there has been a postponing until a more favorable time. The accumulated demand must be met, and when the resumption of work once finds itself under way it will quickly gain momentum and will maintain it until the demand has been satisfied.

There is declared to be a disposition on the part of municipalities, corporations, companies, and individuals to set the wheels in motion as soon as possible in order to employ labor, provide markets for building material, put money in circulation, as well as to secure the needed buildings. Few people are showing a disposition to hold back and wait for a more convenient season. The psychological situation is right, and this will count much in bringing about the results desired.

Much is being said on the money situation. No one denies that there is plenty of money in the country; for it has not gone elsewhere; but its appearance in active business depends on confidence. Too much emphasis cannot be laid on confidence. Without it the new banking laws, the rate increase to the railroads, and all other financial measures combined, will not suffice to revive the building operations of the country. The people with money must not be afraid to invest it; corporations and individuals in positions to extend credit, must be wholly willing to do so. It is said that these conditions are about to be realized; and in that prospective fact, many observers base their belief that a marked improvement in building will soon come.

Financiers watch the results of bond elections throughout the country, and in these results they can feel the business pulse and detect signs of improvement. The claim is made that recent elections of that kind have been favorable, and this has increased the confidence of those who are looking into the future for signs of coming prosperity.

Little Hardwood Being Sold on Contract

FOR THE PAST WEEK *HARDWOOD RECORD* has been gathering information from woodworking institutions all over the country as to what they are likely to use in 1915. This work is a regular annual feature of the service of consumers' requirements issued in connection with the advertising service of *HARDWOOD RECORD*, and it offers an opportunity for observing the trend of requirements and for presaging in a surprisingly accurate manner probabilities for the use of certain woods for 1915.

The corrected information as secured from concerns already listed in this service has not come in as yet in sufficiently large volume to warrant an attempted analysis of probable changes for the coming year. However, there is one very significant point which has already been developed which indicates that in spite of the fact that many hardwood consuming institutions are endeavoring to place contracts for 1915 requirements the lumbermen as a whole are setting forth a

bold front as opposed to this proceeding and are holding their stocks for prices more commensurate with their value. As a matter of actual fact, out of approximately 500 replies already received there are only six which state that the concerns replying will not be in the market for hardwood lumber during 1915 on account of their already having contracted for requirements during that period. Of these six one states that it is bought up for six months, while the rest are covered in their requirements for the entire year.

In the main, the replies show continued interest in hardwood supplies, which proves, in addition to the fact that there is little contracting being done, that the terms of present sales are for the most part for short periods and that lumbermen are protecting themselves against a rise in the market by not accepting orders for more than thirty to sixty days' time.

HARDWOOD RECORD purposes to analyze the entire matter when it is completely at hand and will, as far as possible, endeavor to show the trend of changes in requirements for the coming year.

Wood Still an Important Car Material

WHILE THERE HAS BEEN a tremendous amount of agitation against the increased use of steel in car construction without adequate proof that it is a superior material, there still seems to be a vast opportunity for the use of wood for this purpose. As a matter of fact, the decreased consumption of wood for car construction has been much more marked in the construction of passenger cars than it has in the construction of freight cars.

The *Railway Review* of Chicago has summarized car sales during 1914 and the statistical records shown offer some very striking and, in the main, rather satisfactory evidence to the lumbermen that they have not entirely lost out in this important field of consumption.

In 1914 orders were placed for 83,168 freight cars and 2,112 passenger cars. It is very disappointing to compare these figures with the preceding year, as in 1913 the respective figures were 144,843 and 3,212. The decrease in 1913 over the preceding year, however, was even more marked, 1912 having established a high mark for car orders.

The pertinent feature of the statistical record, however, is the analysis showing the type of cars put into use during the past year. Out of the total of 2,112 passenger cars 1,599 were of all steel construction, 101 had wooden and steel bodies on steel underframes, 236 had steel underframes and wooden bodies and 176 were of all wood construction.

The general impression has been that the construction of all wooden passenger cars has practically ceased, but this would indicate a little more interest in this type of construction than formerly.

Analysis of the freight car situation is even more gratifying, as it shows that wood played an exceedingly important part in this feature of car construction the past year. Out of the total of 83,168 freight cars ordered during 1914 there were 1,158 cars of all wood construction. However, it is gratifying to note the large number of cars with wooden bodies and steel frames which were ordered during 1914. This is especially true in view of the fact that the main bulk of raw material going into the construction of freight cars is used in the body. In fact, 30,206 freight cars out of the total number ordered had wooden bodies with steel underframes, giving ample grounds for a more hopeful feeling for future car construction. Out of the total number of freight cars ordered there were 15,515 cars with combination wood and steel bodies and steel underframes, and 2,953 cars with wooden bodies and combination of wood and steel underframes. Thus wood held a prominent place in the manufacture of 49,832 cars out of the total 83,168.

These figures are more favorable than the figures for the past year covering freight cars and might be taken as indicative of a gradual return to more fair consideration of wood as a car construction material. It is significant that wood is going mainly into freight rather than into passenger cars as the popular and ill-advised clamor for all steel construction would not affect this class of rolling stock. Another significant feature of these statistics is that a great many of the cabooses constructed for housing freight crews while on the road were of wood, which would indicate that those men who make the caboose their home seriously object to living in prison cells.

Prosperity Inspired by Confidence

DURING THE PAST TEN DAYS two of the largest hardwood manufacturing organizations in the country, to be specific, the Lamb-Fish Lumber Company, Charleston, Miss., which at that point manufactures 40,000,000 feet of hardwoods per year, and the W. M. Ritter Lumber Company of Columbus, O., which at its various mills in different parts of the country manufactures some 200,000,000 feet of hardwoods annually, have decided to reopen their operations on a full scale and on a permanent basis. Their respective decisions were made at meetings of directors held during this period, and the orders have already gone into effect. Both of these institutions have interested in their directorates men who not only are thoroughly conversant and closely in touch with lumber conditions, but whose broad business careers enable them to accurately analyze the trend of business in the country as a whole, and the two decisions are most momentous for this reason. Both institutions report that the directors were unanimous in their optimistic feelings and that there was no opposition to the proposition to reopen operations.

The probable effect of this development is easily discernible. It cannot be definitely said that other mills will follow suit, but there is every reasonable assurance that this will be the result. Thus we see the beginning of a great wave of optimism which will spread through the hardwood manufacturing field. The leaders in any business should realize the psychological effect which their actions have upon those not so closely in touch with the big affairs of the country. It is generally recognized that corporations of the magnitude of these two concerns have in their organizations men who are recognized as occupying prominent positions in the business world. The opinions of these men as reflected in the actions of the companies they are connected with are generally speculated upon by others in the same trades, who are not in such prominent positions.

Probably the most important feature of this development will be the effect this move will have upon the buyers. They will unquestionably not only feel that it presages a period of higher prices, which indicates the desirability of buying as quickly as possible, but they will be given increased confidence regarding their own business as they can reasonably feel that men behind such prominent enterprises are in position to know and see things which they themselves are unable to get in touch with.

Good Business for Yards to Buy Now

IT IS A DIFFICULT undertaking to convince the consuming factories that it would be wise to buy lumber now while prices are low, as with them it simply means a question of putting their money into stocks they might not want, in order to take advantage of lower price conditions. With the hardwood yard trade, however, the proposition is somewhat different. In that business it is simply a question of buying right and selling right, that is, the stock that is bought has to be sold. Profits from the raw material are not made indirectly as in the woodworking business. Thus a different policy should prevail, or at least consideration should be given to another feature of the condition.

For instance: We will say that a yard man bought stock before prices reached the present lower level, at \$30 with the expectation of realizing his profit by selling for \$35, this to include the carrying charges in the meantime. Considering then that the slump came on and that he was able to get only \$30 for the stock this would mean a direct money loss. There is only one way to make up this loss, namely, to buy the same stock at the lower market price in order to show a profit on his investment. That is, if he can go out and buy this same lumber at \$25 at the lower price prevailing at the mill, it would mean that his original investment was protected to the extent of the profit he originally counted upon. Thus it is not, as in the case of the woodworking institution, simply a matter of not wanting to put his money into stock, but of being almost compelled to in order to protect his previous investment.

On the face of it, at least, it would seem that the yard trade is making a mistake in not taking advantage of present price conditions which will unquestionably not last very much longer.

World Markets for American Lumber

BY HU MAXWELL
NINTH ARTICLE

Editor's Note

Lumber markets in the Mediterranean countries are not new. The earliest known trade in forest products was there, and the trade has continued from ancient times till the present. Centers have changed, routes have shifted, sources have not been permanent, destinations have varied in conformity with political movements; but during all recorded time there has been trade in timber in the Mediterranean countries. America became interested in that business centuries ago. New England shipped pine, oak, and ash to Portugal from the first settlement of our Atlantic coast. The present is an opportune time for increasing our export timber business with the Mediterranean countries. It will not be necessary to discover or create new markets. Those now existing are large, and if we take only what others seem destined to lose in the course of present troubles and the political changes which are likely to follow, the lumber exporters of the United States will make large gains. Those countries are as anxious to sell their commodities to us as we are to dispose of ours to them. Results greatly to the advantage of them and us may be brought about by a shifting of the channels of trade, turning them in our direction instead of toward the north of Europe, where they have been running in the past.

The Mediterranean countries are liberal buyers of American forest products. This is particularly true of the countries on the Mediterranean's northern shore. The present article deals with that region. The southern coast of that sea was considered in a former article of this series dealing with Africa. This sea is enclosed by three continents, Europe, Asia, and Africa. Having that fact in mind, the ancient geographers called it the sea "in the middle of the world," which is the meaning of the word "Mediterranean." Its position has always made it a center for world trade, since world trade first began. The Egyptians were the earliest to use it, so far as history has left record, and it is worthy of note that some of the earliest cargoes were of logs cut on the coasts of Syria and carried in ships to Egypt, and some of that identical wood is in existence today, and may be seen in museums in the form of mummy cases and old boats. The ancient Egyptians appreciated the trade advantages of their position. The old admiral in the service of Egypt (according to the poet who recorded the circumstance) thus explained the geographical advantages: "Here sits Egypt. Here lies Punt. And here the Sea of Suf which I have seen."

After Egypt came the Phoenicians and the Carthagenians who traded with all the Mediterranean shores. After that the Greeks became the traders by land and sea, and were followed by the Romans who were a long time in learning to sail ships. The Venetians succeeded the Romans as the chief traders of that part of the world, and after them came the modern nations.

The countries considered in the present article include Portugal, Spain, Italy, Greece, Montenegro, Servia, Bulgaria, Roumania and Turkey in Europe and in Asia. Geographically, southern France and southern Austria are Mediterranean countries; but since they are only portions of larger countries, they are omitted from present consideration. The area and population of the region are shown below.

	Area square miles	Population
Turkey in Asia.....	1,000,000	20,000,000
Spain.....	441,000	18,754,674
Balkan States and European Turkey.....	185,856	21,000,000
Italy.....	110,646	33,000,000
Portugal.....	34,502	5,021,657
Total.....	1,772,004	97,776,331

The Balkan states and European Turkey are grouped because, as a result of the two wars recently fought in that region, various additions and subtractions of area were made, some of the countries becoming larger at the expense of others. Available statistics do not show these changes, and, it is impracticable to state the exact size and population of each of the states. This has made it necessary to group them and consider the group as a whole in stating population and area. The imports for 1913 are given for each of those countries separately, and they will be further considered separately as far as it is practicable to do so.

Turkey in Asia belongs with the Mediterranean countries, because of its geographical position. It embraces more than half of the region and one-fifth of the population, but it is not a large buyer of lumber. Practically all of the imports of lumber into Asiatic Turkey enter through the Mediterranean ports. The vast interior, especially the southern part, is chiefly desert, or it is so remote from ports and other means of communication with the outside world, that the exporter of lumber from the United States has little immediate prospect of doing business there.

SPAIN

Spain is a good customer for staves made in the United States, and it buys other forest products also. It sends us grapes in barrels with cork dust packing. These barrels are to be seen during autumn and winter in nearly all fruit stores. The cork dust packing is a pretty reliable proof of origin, though some such packing may come with grapes from Portugal or Morocco. The dust is the waste from cork cutting establishments. The staves which Spain buys in America are partly for grape barrels, and are classed as slack cooperage, and partly for wine barrels, which classifies them as tight cooperage. Some of the barrels made from American staves and containing wine, as well as some of those containing grapes, come to America.

Spain is nearly twice as large as Texas and its population is five times as great; yet only parts of Spain are thickly settled. It contains large areas of worn and deserted land, where conditions are almost desert-like. As a whole, Spain is a poor country. It exhausted itself, both as to natural resources and men, in its long course of establishing and losing colonies, and in fighting wars more or less unsuccessfully. It once was the largest holder of colonies and was regarded as the wealthiest and most powerful country in the world. Its last American colony has departed from it, and most of those in other parts of the world, and with the colonies went a larger Spanish population than now remains in Spain.

It has been claimed that much of Spain's present sterility has been the result of forest destruction. Tracts which were well wooded and of extreme fertility during the Moorish occupation, are now treeless and poor. The stripping away of the forests caused the drying up of streams formerly perennial, and probably also lessened the seasonal rainfall.

Spain needs large quantities of lumber and other forest products. It can secure them only by importation.

The chief regions of supply are the United States and Norway and Sweden. The statistics given in this article show what forest products Spain is buying from America. It augurs well that Spain is desirous of doing more business with us. It is anxious to sell us more, and consequently will buy more of our products.

PORTUGAL

Conditions in Portugal do not greatly differ from those in Spain, as far as they affect the market for lumber and other forest products. Portugal is not one-tenth as large as Spain, but has more than one-fourth as many people. It is more evenly developed and does not have so much vacant and unprofitable land. It has been more fortunate with its colonies. Though it lost Brazil, which is one hundred times as large as Portugal, it still holds enormous areas in Africa, and some of them are developing at an encouraging rate, and have established satisfactory trade with the United States. We purchase grapes, wine, cork, and many other commodities from Portugal, and though that country is less than one-tenth as large as Spain, it buys two fifths as much forest material from us.

ITALY

This is the most populous country of southern Europe, and is our best customer in that region, in the purchase of forest products. Its annual imports from us exceed Spain's by \$400,000. It is a country highly developed, but in some districts it is rather overpopulated and many of the people lack the means of buying furniture,

vehicles and other commodities from us. Italy has much for sale and the people are anxious to increase their business dealings with America. Conditions are favorable for larger sales there of lumber and of articles made of wood. It is not so much a matter of creating a desire on the part of the Italians to purchase from us, as it is of making it possible for them to do so. If our purchases from them could be increased, they would respond by purchasing more from us.

Italy is not a heavily timbered country, and it has never been during historical times. It appears to have been thickly populated at the dawn of history, and early writers have little to say of forests in the modern sense of the word. It is apparent that Italy has imported most of the lumber used during many centuries, though much cheap native stuff is cut for boxes, fuel, and stakes for grape vines. It is said that Nero found Rome built of wood and left it built of marble. That would imply that wood at one times was important as a building material. Excavations at Pompeii show little use of building lumber, but a fair amount for furniture. The early Italians knew how to work in wood, and samples of their carpentry which have come down to the present time compare favorably with the best work of today. They knew how to make and lay veneers, but every part of the work was done with hand tools. They appreciated finely figured woods and used them to advantage. Italy today is the largest buyer in southern Europe of our red gum. Its finely figured forms appeal to the Italian cabinet maker.

THE BALKAN STATES

The countries lying between the Adriatic and the Black seas, including European Turkey, Roumania, Bulgaria, Servia, Albania, Greece and Montenegro, are not large purchasers of American lumber, for two reasons. Some of those countries have a fair amount of forest of their own, and they are not extensive users of building lumber. Roumania, though farthest from us, buys more of our forest products than all the other Balkan countries together. Its purchases are largely agricultural implements which contain much American wood.

Servia, Bulgaria, Turkey and Greece have been so distracted by war of late that the figures of exports to that region for 1913 are scarcely a fair showing; but at the best those countries are prospective rather than developed markets for lumber.

Information concerning forest resources in the Balkan states is fragmentary and unsatisfactory. The total area of forest land is placed at 20,000,000 acres, apportioned as follows (before last Balkan war): Roumania 6,000,000, Bulgaria 7,000,000, Servia 3,000,000, Greece 2,000,000, Turkey 2,000,000. Territorial divisions following the war in the Balkans redistributed these areas, some countries now having more, and Turkey in Europe now possessing less, but the total of 20,000,000 acres remains.

Total area of forest is not a reliable basis on which to calculate the stand of timber. Much of the area designated as forest land in the Balkan states is covered with scrub growth of no present or prospective value. Greece, for example, is credited with 2,000,000 acres of forest, but it is said that much of this area consists of precipice, bare rocks, stony gorges, and sterile hills without a merchantable tree in sight. The country was heavily forested in ancient times, and the Greeks sent ship timbers for the largest navies in the world at that time. Two thousand years of abuse and waste have left scarcely a remnant of commercial forest. Similar conditions hold throughout most of the Balkan countries. Bulgaria has forests more valuable than the others, and considerable box lumber has been recently exported from there to Greece and Turkey in Asia.

OTHER TERRITORY

Some forest exports are going from the United States to Asiatic Turkey, but that trade is confined almost wholly to the Mediterranean coast between the Dardanelles and Egypt. The interior of the country is not a buyer of lumber. It cannot be handled with the present means of transportation. The coast of Syria, north of Palestine, was once a timbered region whose products were exported. The cedar and pine for Solomon's temple were cut there, and likewise most of Egypt's supply of wood. No remnant of the wood used in Solomon's temple has come down to modern times, but some

of the Egyptian coffins and boats remain. If they are fair samples of the grade of lumber taken from the Syrian forests three or four thousand years ago, it was rather poor stuff. The wood was too knotty to meet the requirements of a modern lumber buyer who is accustomed to white pine, yellow pine, or Douglas fir.

The Island of Malta with 188,000 people, Gibraltar with 27,000, and the Azores and Madeira islands with 408,000, are included in the Southern Europe area. They are comparatively large users of American wood.

EXPORTS TO SOUTHERN EUROPE

America's exports of forest products to southern Europe are grouped in fourteen classes, which are shown below with the value of each for 1913:

Commodity	Value
Lumber	\$1,992,975
Cooperage	1,579,489
Sawed timber	1,159,117
Agricultural implements	1,040,355
Furniture	112,284
Round logs	55,072
Horse vehicles	39,793
Joists and scantling	25,260
Sash, doors, blinds	24,425
Pulp	19,609
Hewed logs	6,150
Woodenware	2,243
Incubators and brooders	1,638
House finish	571
Total	\$6,049,981

The lumber included in the above item consisted principally of the following woods:

Longleaf pine	\$1,352,620
Red gum	400,573
Oak	160,525
Cypress	8,121
White pine	3,445
Yellow poplar	2,910
Other lumber	64,781

The cooperage total is made up of the following items:

Staves	\$1,560,183
Shooks	9,864
Empty barrels	9,442

DESTINATIONS

The destinations of the lumber and other forest products sent to southern Europe in 1913 included eleven countries or colonies, each of which is separately shown in the statistics. It may here be seen at a glance where our best export trade lies. It was distributed as follows:

Destination	Value
Italy	\$2,526,392
Spain	2,119,020
Portugal	848,079
Roumania	374,489
Azores and Madeira	55,735
Turkey in Europe	52,831
Greece	48,276
Bulgaria	23,756
Gibraltar	1,148
Malta	187
Servia	68
Total	\$6,049,981

Italy is our best customer in southern Europe for forest products. A grouping of its purchases in 1913 is shown below:

Commodity	Value
Lumber	\$ 997,592
Hewed and sawed timber	891,028
Agricultural implements	417,542
Furniture	85,789
Pulp	19,609
Cooperage	14,074
Joists and scantlings	13,550
Woodenware	1,883
Carriages and wagons	620
House finish	454
Incubators	380
Other manufactures of wood	83,871
Total	\$2,526,392

NAVAL STORES

Naval stores of considerable magnitude are exported by Americans to the countries of southern Europe. The principal articles are tar, pitch, rosin and spirits of turpentine from the yellow pine forests of the south. In the Mediterranean markets the American exporter of these commodities meets competition from France, Germany, Russia and Austria. During the continuance of the present war those countries will have no naval stores to spare, and there should be an opening for an increase of exports from America. The increase has not, apparently, begun yet. Though these articles are called naval stores they have little to do with ship building. The name has come down from former times when tar and pitch were employed in calking vessels and in waterproofing the ropes used in the rigging. Naval stores are now largely used in the manufacture of paints and varnishes. The value of exports of tar, pitch and turpentine from the United States to those countries last year was as follows:

Italy	\$780,801
Spain	90,208
Azores and Madeira	3,583
Portugal	348
Turkey in Europe	325
	\$875,265

ASIATIC TURKEY

Turkey in Asia belongs geographically though not politically with the Mediterranean countries of Europe. Whatever trade in American lumber may now reach that part of the Turkish empire must pass through the Mediterranean sea. It is possible for Turkey to import lumber by way of the Persian gulf, but little, if any, American lumber has ever entered by that route.

The value of our trade in lumber and kindred manufactured products with that region is now so small that it might be omitted without much diminishing the totals; but, though small, it is an opening wedge which may lead to better things in the future. Smyrna is the principal port of entry for that region, though there are other ports through which lumber might reach some portions of the interior. Our exports of forest products to Turkey in Asia in 1913 are set forth in the following figures:

Commodity	Value
Square pine timber	\$ 50,509
Agricultural implements	29,679
Furniture	15,407
Oak and red gum lumber	3,108
Carriages	2,274
Wheelbarrows	2,216
Box shooks	1,596
Woodenware	160
Incubators	48
Other manufactures of wood	14,971
Total	\$119,965

FUTURE PROSPECTS

The sales of American forest products around the borders of the Mediterranean sea have been only moderately large, considering the population and resources of those regions. Opportunities seem fair for increasing business in those countries. They have heretofore obtained most of their lumber from eastern and northern Europe. Some of it came from Russia, some from Germany and Austria, and other from Norway and Sweden. Austria, Germany and Russia are now at war and while hostilities continue very little timber will be cut for export. Russia has forbidden such exports. That order may be revoked at any time; but even should that occur soon, it is a safe guess that little wood from any part of the Russian empire will reach southern Europe while the war continues. It would take a good prophet to tell how long that is likely to be.

Norway and Sweden are at peace, and they are large timber exporters; but the war has so greatly multiplied the difficulties in the way of exporting wood from those countries, that an enormous decline has taken place, and no immediate prospect appears for anything better. The blow that struck Sweden and Norway hardest was the placing by Germany of all wood, even for fuel, on the contraband list. Any ship that sails from those countries with wood on board is liable to seizure by German war vessels. Several ships have already been stopped and turned back. The result has been that

the export of all kinds of wood from the Scandinavian countries has practically ceased.

If that order by the German government should be revoked, great difficulties would still lie in the way of exporting timber from Norway and Sweden. The North Sea, through which the ships must pass, is covered with mines which make navigation dangerous. Several neutral ships have been destroyed by these mines.

Under such circumstances it is apparent that the supply of wood reaching southern Europe from the north will be small. The people of the Mediterranean countries will still need staves, boxes, and other forest products in about the same quantities as before. America is the natural source from which to draw these supplies. Austria formerly sent oak staves for tight barrels. America is about the only place where these can now be procured. The only woods which Sweden and Norway have for export purposes are pine and spruce. These have gone to southern Europe in large amounts for boxes in which to ship raisins from Spain, Greece, and Syria, oranges and lemons from Italy, Spain, and Portugal, and figs from Smyrna. Boxes for shipping cloth, small statuary, and hundreds of articles made in those southern countries for export, have been largely made of pine and spruce from the forests of Norway and Sweden.

While northern Europe is temporarily unable to continue that supply, the American exporters will be missing an opportunity if they do not push their lumber into the Mediterranean markets. Possession is a powerful leverage in trade. If a foothold is once obtained in that market, it should be easy to win permanent advantage.

LOOKING AHEAD

Although many people have opinions on the subject, yet no man can now tell the final result of the deplorable war which is devastating so much of Europe and destroying hundreds of thousands of the best men of the warring countries. No one, however, should suppose for a moment that such wholesale destruction will improve business generally. Depression is bound to follow and affect business for years to come. America cannot expect to escape the depression entirely; but our position is fortunate, and we should be prepared to make the most of it. Our lumber exporters will be in a position to occupy every market made vacant by the withdrawal of former competitors. The time to act is now, rather than after the war is over.

Our government, acting through the Bureau of Foreign and Domestic Commerce, Washington, D. C., is prepared to supply valuable information to business men on the subject of foreign openings for trade. By keeping close watch upon trade opportunities in the lumber line, and acting vigorously, the present seems an opportune time to begin a campaign to increase our exports of forest products to the south of Europe. Greece, for example, bought sixty per cent of its timber from Austria before the war, but is getting none from that source now. In that one item alone there is trade worth nearly \$2,000,000 a year to go somewhere else while Austria is out of the running; and it should come to America. It is the same in Italy, Spain, Portugal, and in the Balkan states. Timber trade worth millions of dollars has been turned from its old channels, and the United States should get most of it, and now is the time to go after it.

There is little doubt that the war will change the boundaries of some of the European countries, but it is yet too early to say how and where the new boundaries will run, or what they will include or exclude. The political and geographical results will not make material difference so far as our timber trade with the countries are concerned. The demand for wood will not be much affected by political changes in government or geographical changes in boundaries.

IN ASIA MINOR

The case is quite different in passing from Europe to Asia Minor. Political changes there might make profound differences in the amount of trade which American lumber exporters would be able to carry on. Should the fortunes of war put progressive European nations in control of the million square miles of territory between the Mediterranean sea and the Persian gulf, it would mean a market for American forest products fifty or a hundred times greater than at present, because development would begin, and the centuries of

stagnation under the non-progressive Moslem would end. This is speculating somewhat in the future, and predictions are conditioned on uncertainties, but in that corner of the world lie large possibilities, and it is worth while to glance a moment at what might happen if real progress should obtain a start in that region where the hand of death has been laid upon all enterprise for hundreds of years.

The cradle of human civilization was in the Euphrates valley, and it was a high civilization. When the Greek Herodotus visited that region 450 B. C. he refused to describe the luxuriance of the vegetation, because he feared that people would not believe the truth; and when Xenophon led the "retreat of the ten thousand" through that country, the hardest obstacle that his army had to overcome was the network of irrigation canals which covered extensive regions. Nebuchadnezzar's great irrigation canal was the largest in the world, ancient or modern, and its ruins today are worthy of comparison with the Panama Canal. It was 250 feet wide and 480 miles long. There were hundreds of other canals from 60 to 200 feet wide. Some are today in such good state of preservation that with some repairs water for irrigating the country could again flow through them.

There is abundance of water to redeem the country, but under the non-progressive governments of the past centuries, waste and ruin have reigned supreme. Every attempt by European to develop the country has been hindered by the Turks. Some railroads have been built and others have been planned, but the blight of oriental non-progressiveness has been upon every effort. The native population has been unable to understand what progress consists of, and, of course, incapable of taking any effective steps to bring it about. The natives have been content to remain two thousand years behind the times in one of the most fertile regions of the world.

If the present upheaval should throw that country open to civilization, a large market for American lumber would be one of the first results. The region has no timber. It was cut down 3,000 years ago. The natural source of timber for railroads, bridges, houses, boats, and all other purposes, including vehicles and agricultural implements, will be the United States. In figuring on that market, one is dealing with the future, but the consummation may not lie far in the future. If the country is given relief from lawlessness and oppression, it may be expected to develop with phenomenal rapidity.

The Letters You Write

It is easy to sustain the argument that letter writing plays a much more important part in business life today than ever before. Many things have been invented to facilitate correspondence and as a consequence much of the business of the world is carried on by mail. Yet with all the modern facilities for doing the work and with the recognized importance of the letter in business transactions, it seems to be a fact that we are in the midst of an era of unparalleled carelessness so far as letter writing is concerned. Men have attained that point in letter writing where they feel they are through with the task the minute a letter is dictated, and do not take the time and trouble to read it over and sign it before mailing.

Many mistakes have occurred because of this carelessness. There have been so many of them that some people print in their letter heads that they will not be responsible for stenographic errors, and others stamp on their letters "Dictated but not read after transcribing." Better cut out that kind of carelessness, boys, and read your letters over before signing and mailing them. To blame errors on the stenographer and then try to correct them on this basis afterward is not good business. Rather prevent some of the errors by reading your letters over after they are written.

Not long ago a lumberman was looking for a stenographer. He said he had just discharged the one he had because she didn't exercise judgment and show good sense. When pinned down for specific explanation it developed that the stenographer had failed to correct certain errors in quotations being sent out, errors that had been made admittedly by the lumberman himself, yet he discharged her because she didn't notice them.

This is expecting too much of a stenographer. A man hires a stenographer at prices ranging from \$10 to \$25 per week, depending upon the magnitude of the business and the skill of the stenographer. Sometimes one pays a stenographer a good salary, that is for stenographic work, but it is not a salary commensurate with the requirements if one is to shoulder on to the stenographer all the responsibility of auditing errors and checking up business judgment. Talent and brain work of this kind is worth more money than that and is of the order that belongs to managers, not clerks. In other words, the very work and responsibility that some business men are inclined to put upon their stenographers is work, judgment and responsibility that they are supposed to be exercising themselves.

Letter writing can not become a fine art so long as a man lets it go after dictating. It is not enough, neither is it satisfactory to use a rubber stamp calling attention to the fact that the letter has been dictated by so and so but not read after typing. This is a poor way to conduct correspondence and it is the duty of every business man

to read over his letters after they are written. There may be excuse for neglecting this duty now and then under the stress of certain occasions, but to do it regularly day in and day out is a poor business policy.

J. C. T.

Kentucky's Compensation Law Invalid

The Kentucky court of appeals sent the workmen's compensation act of that state to the legislative boneyard just as the law was about to go into effect, although the decision was announced on a narrow vote of four to three of the justices of the court. At least, the court holds that the law is invalid, so far as it may be construed as being coercive in its effect, and that is the life of the law. The court intimates that the parties to employment contracts may validly limit the amount which shall be recoverable against the employer for injury to the employe in the course of the latter's work, but holds that, under the organic law of Kentucky, the legislature is without power to coerce such action, as is found would be the effect of the law if it were upheld in its present form. The court of appeals, however, expresses favor for a proper form of compensation legislation.

In addition to a limitation of amounts recoverable for personal injuries, the court decides that the new law is objectionable on account of its provision to the effect that where an employe is killed in the course of his employment, and leaves no dependent relatives, part of the award to be paid on account of the accident shall be paid into a fund available for the payment of compensation for injury to other workmen. In other words, the act would "rob Peter to pay Paul."

In Kentucky, the effect of the decision will be to defer, if not permanently defeat, the final adoption of an enforceable compensation law there. In other states, the action of the court of appeals will afford a strong precedent for the overthrow of similar laws which have not yet been submitted to the judicial test.

In parts of the West where trees are scarce, sage brush is used for fuel. In Nevada the large main stems are trimmed by Indians at \$3.00 a cord and delivered to the user at about \$6.50. Sage brush burns rapidly and is rather dirty, but produces good heat.

A log raft containing 1,000,000 feet of cedar, said to be the largest ever floated on the Pacific, recently made the trip from British Columbia to Puget Sound. It was 100 feet long and 70 feet wide; it stood 15 feet out of the water and 20 feet under.

The Lumbermen's Round Table

Lumber Traffic Requirements

The old adage about the man who is his own lawyer having a fool for a client will almost hold good when "traffic expert" is substituted for "lawyer." This is particularly true of the lumber business, and it is becoming increasingly evident that the lumberman who is doing a business of any volume must have really expert advice constantly regarding traffic matters if he is to avoid serious losses and if he is to be properly posted on developments in this direction. A good many lumbermen try to keep up with the changes in tariffs and rules, and some have been known to handle their own complaints before the Interstate Commerce Commission; but it is certain that the man who is wise enough to be a good lumberman hardly has the time to master the infinite minutiae of traffic work, and that a much better plan is to employ someone who can give his whole time to it. The concern which is large enough should have its own traffic department, while smaller concerns should co-operate in the maintenance of a joint bureau. It is money well spent to keep a man who knows the business engaged in watching for rate changes, working for better rules and regulations, and seeing that the market in which he is interested is not discriminated against.

The True Economy

In these days when business is coming hard and when the average lumberman, like other business men, is trying to cut off expenditures wherever possible, there is the danger of lopping off expenses which are contributing much to the permanent success of the business. This is particularly true of the sales department, where it is so difficult to get the right man, and where it takes so long to learn the peculiarities of the trade of various customers. Real economy consists in eliminating unnecessary expenditures, but the wise manufacturer will ponder carefully before he makes a reduction, to be sure that he is not amputating, as well as merely cutting off.

Disraeli's famous quotation is being much used these days, and it is worth reproducing here:

"Economy does not consist in the reckless reduction of estimates. On the contrary, such a course almost necessarily leads to increased expenditures. There can be no economy where there is no efficiency."

These words, directed to national policy, are equally applicable to private enterprise.

Knowledge Is Power

A former furniture manufacturer, now specializing in the selling end of this business, said recently that he is finding his knowledge of the manufacturing details of the trade to be a most important asset. It enables him to show his customer exactly wherein the value of his goods lies, and to demonstrate to him, by a technical explanation of methods of construction and processes, that his offerings really have quality and class.

The idea that the salesman ought to know something about the manufacture of his goods is spreading, and is true not only of furniture, but of many other lines. There seems to be no reason why the lumber salesman should not be similarly equipped, and yet there are a good many men out on the road trying to sell hardwoods whose knowledge of the commodity is limited to what they can see on the stock-list. They are not in a position to do much constructive work. All they can hope to do is to make personal friends, and get business through this medium, or to quote low prices, and capture trade on a strictly competitive basis.

The salesman who knows his proposition thoroughly, who can talk lumber from the stump to the pile, is in a splendid position. Like the others, he may be having his troubles just now, when less lumber than usual is being bought, but he is the kind you can't keep down, and he is sure to come into his own.

The Real Veneer Problem

Veneer manufacturers assert that the vast majority of the furniture manufacturers of the country use built-up work in their products. Something like ninety per cent of the factories, it is claimed, are using glued-up tops, panels, drawer-bottoms, backs and other sections of their goods, and are finding this plan satisfactory.

This being the case, it follows that the furniture trade favors the use of veneered goods, and believes in it. If this is so, why is it that one never finds a piece of furniture with a tag carrying the words, "This Buffet is Veneered," or "This Table has a Veneered Top"? Yet, on the other hand, manufacturers who use no veneered work usually make a talking-point of it. They don't argue the question, but merely announce boldly, "Made of Solid Mahogany—No Veneers."

The fact that emphasis is laid upon the *absence* of veneers in furniture, and that their *presence* is never referred to except when necessary, is the thing which is confirming the public in what amounts to a strong prejudice against veneered goods. Lest the reader assume that this is putting it too strongly, let him go into a furniture store, as an ordinary customer, and see the way the salesmen "play up" the fact that this, that or the other piece is made of solid material. Of course, every store has plenty of veneered goods; in the nature of the case it has to; but the salesman, knowing or believing that the ultimate consumer favors solid pieces, uses this as the strongest string in his bow, and because he believes that it is the short-cut to sales.

A little more aggressive attitude on the part of furniture manufacturers who use built-up stock would help to dissipate this impression on the part of the public. If furniture of class which has a built up top or panels were to be so labeled, and then some sort of adequate and authoritative explanation given of *why* this form of construction was used, it would not take many years to get away from the present condition, when the term "veneered" is looked upon as a word of reproach by the average consumer.

More Money in the Bank

The average lumberman probably could not explain with fluency the *modus operandi* of the Federal reserve system; but there is one feature of the plan which is understandable to everybody, and which is most significant in its promise of better times.

Without actually creating more currency, the operation of the system has added about a quarter of a billion dollars to the available amount of money. This paradox is explained by the fact that the reserve limits of national banks were reduced, making it possible for hundreds of millions of dollars that have lain in the vaults of the banks, being held against a possible "run," to be put into active circulation.

This one factor is sure to be an immense help to business, because it insures easier money conditions and lower interest rates, without reference to the issue of federal reserve notes, which will also add materially to the money supply. The increased amount of currency put into use will help the lumber business most directly, perhaps, in connection with the building trade, for it will enable construction work to be financed more readily, and will assist in ending the stagnation which has been on in this field for some time.

Lumber for Export

Although the direct call for lumber for export purposes is at a low ebb, a good deal of material is being exported, nevertheless. This is explained by the fact that millions of dollars' worth of war supplies have been contracted for in this country, and all of these goods must be well and strongly packed for shipment abroad. This, of course, has meant wooden boxes for the saddles, harness, shoes and other leather goods; clothing, underwear and hosiery; and in fact practically all of the supplies which have been bought. Hardwood men have noted an increased demand for low-grade material, a fact which is explained chiefly on the ground that the export movement of war supplies is calling for more packing lumber.

Because of the war, English manufacturers and consumers of wood pulp have been caused considerable uneasiness. Production is at a standstill in the countries at war, and in Norway and Sweden, principal sources of supply, mills have been greatly hampered because of a lack of coal and of chemicals. England has practically no domestic sources of pulp.

Pertinent Legal Findings

Receivers for Lumber Corporations

If the majority of stockholders and the directors of a lumber company are found to be permitting an officer of the company to conduct important matters of the company irregularly and without keeping an intelligent account thereof, a receiver will be appointed on application of a minority stockholder. (Louisiana supreme court. In re Receivership of Leidigh-Dalton Lumber Company, 66 Southern Reporter 390.)

Destruction of Machinery Under Conditional Sale

In a recent suit against a railway company brought by a lumber company for negligently setting fire to a mill, the Tennessee supreme court decided several interesting rules applicable to loss of machinery held under a conditional sale contract, title being reserved in the seller until payment of the agreed purchase price. (Unaka Springs Lumber Company vs. C., C. & O. Ry. Co., 170 Southwestern Reporter 591.) The court holds that destruction of machinery in the hands of a conditional buyer does not avoid his liability for the remaining purchase price which he agreed to pay. In such case either he or the seller may recover the value of the property from the person through whose negligence it was destroyed, but the recovery will be held for the benefit of both parties to the contract.

Time for Delivery of Lumber Sold

In a suit for breach of contract to deliver a quantity of lumber, it appeared that it was finally understood between the parties that delivery should be made after a certain date, on demand of the buyer, and the Alabama supreme court applied the following general rule of law applicable to sales in general:

"When the time of delivery is at the option of the buyer, he must at least exercise his right within a reasonable time, and the seller is entitled to a reasonable time after notice to make delivery, but he cannot delay delivery beyond a reasonable time." (Mobile-Gulfport Lumber Company, 66 Southern Reporter 438.)

Authority of Representatives

As between an employer of a representative and third persons the limit of the agent's power to bind his employer is the apparent authority with which the agent is invested. The employer is bound by the acts of the agent within the apparent authority which he knowingly permits the agent to assume, or which he holds the agent out to the public as possessing. The reason for this is that to permit the principal to dispute the authority of his agent in such cases would be to enable him to commit a fraud upon innocent persons. (New Jersey court of errors and appeals, J. Wiss & Sons Company vs. H. G. Vogel Company, 92 Atlantic Reporter 360.)

Duty to Trespassing Children

In sustaining a judgment against a planing mill company for injury to a boy nine years old, caused by his pulling down a pile of lumber loaded on a two-wheeled truck, which was left in such manner that one end of the load projected from a dry kiln into a street, and which was so loaded that it required but slight exertion to overbalance the load, the Arkansas supreme court said in the case of McDaniel vs. Valley Planing Mill Company, 170 Southwestern Reporter 994:

"Appellant (the company), in the exercise of that care which the law requires of an ordinarily prudent person in the conduct of his business, was bound to anticipate that children, as well as adults, were likely to be walking along the street, and that a child of tender years might be tempted to play with a loaded truck or to indulge in such childish pranks as the one in question. * * * Having left the truck there heavily loaded with lumber with the front end sticking up and the load on the truck so nearly evenly balanced that only a slight exertion was necessary to tilt it down, we think the negligence of the appellant was a question for the jury."

In this decision, the court applies the well settled rule of law that a person who negligently leaves a dangerous condition attractive to children, will be held responsible for such injuries as might have been reasonably foreseen.

Transaction of Business by Foreign Corporations

The Alabama statute, which forbids non-resident corporations from

transacting business in the state without first obtaining a license to do so, was invoked against a lumber company in the case of Mobile-Gulfport Lumber Company vs. Brunner, 66 Southern Reporter 438. In this suit, plaintiff company sought to recover damages for breach of a contract by defendant to deliver a quantity of lumber in care of a vessel at Mobile. One of the defenses successfully interposed was that plaintiff, a non-resident corporation, had not obtained a license to do business in Alabama at the time the contract was entered into, and that, therefore, the agreement was unenforceable. Since it is well settled that laws of this kind do not apply to interstate or foreign transactions, but only to contracts made and to be performed wholly within the limits of the state, the lumber company replied to the defense that the contract in question constituted an interstate transaction, for the reason that when it was made it was contemplated by both parties that the lumber would be immediately loaded by the lumber company in the vessel at which defendant was to make delivery, for shipment abroad. But the Alabama supreme court refused to sustain this claim on the part of the lumber company, holding that the agreement was purely an intrastate transaction, since it appeared that the contract was not only made in Alabama, but that it was to be wholly performed, so far as defendant was concerned, by delivery of the lumber to plaintiff company at Mobile and payment therefor in that city.

Shipper's Right to Sue Carrier

The right of a shipper of a carload of lumber to recover its value from the railway company to which the freight was delivered, on the buyer refusing to receive the same, because not delivered by the carrier which he had designated, was denied by the Arkansas supreme court, in the case of Southern Lumber Company vs. Warren & Ouachita Valley Railway Company, 170 Southwestern Reporter 998, under the following circumstances: Plaintiff lumber company accepted an order from Wm. Buechley & Son of Pottsville, Pa., for a carload of lumber, to be routed over the Philadelphia & Reading railroad as the delivering carrier, the purchasers having switch connections with that road. Plaintiff delivered the lumber to defendant, with directions for routing as requested by the purchasers, but, through negligence of an intermediate carrier, the shipment was delivered to the Pennsylvania Company as the delivering carrier, and for that reason the purchasers refused to accept the delivery tendered by that company on its tracks, and the lumber was placed in storage by the Pennsylvania Company. Thereupon plaintiff brought its suit. The shipment being an interstate one, defendant was forced to admit liability for negligence of a connecting carrier, but successfully interposed the defense that the purchasers of the lumber, and not plaintiff, were the proper parties to maintain the suit. The supreme court decided:

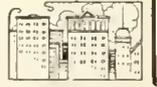

"It is undisputed that the sale of the carload of lumber by the plaintiff to its customer in Pottsville was unconditional, and that it delivered the same to the carrier for shipment in accordance with the directions of the purchaser. The delivery to the carrier under those circumstances constituted a delivery to the purchaser and completed the sale, the title to the goods then being in the consignee. Any loss or damage thereafter sustained fell upon the purchaser as the owner of the goods, and he alone is entitled to sue."

The Laurentide Company of Quebec, producer of pulp and pulpwood, is reforesting its non-agricultural cut-over lands. It is also importing reindeer from Newfoundland, to see if they can take the place of dogs in winter woods work.

A small railroad operating an oil-burning locomotive on the Tahoe national forest, California, had a breakdown during the past summer and burned wood instead of oil for one day. On this day fifteen fires started along the right of way. During the preceding year only one fire occurred near the railroad and it was not thought that the engine was responsible for that one.

Building Revival Prospects

Those who are interested in building operations and have carefully investigated the outlook for 1915 are confident that they see unmistakable signs of improvements that will place this industry far ahead of its conditions at the close of 1914. A recent issue of the *American Contractor* summarized reports from the leading business centers east of the Rocky Mountains, and when the facts thus brought out are considered in connection with information from other sources, the prospect is filled with encouragement. No abnormal activity in building operations is predicted, nor should any be expected. A return to normal conditions is looked for, and that expectation is based on the improvement in financial conditions, and also on the fact that much building has been postponed and the accumulated work will be done at the earliest opportunity.

Take Cleveland, O., as an example. Architects of that city are preparing plans for new buildings the cost of which will exceed \$14,600,000. Buildings for which plans are being prepared by foreign architects for the city will cost over \$3,609,000. Buildings contemplated for which no architect has been employed will total \$6,349,000, or in short the building work now in sight which will go forward in 1915 will cost approximately \$24,558,000. It might be interesting to know just what class of buildings are being planned and financed. The following is a classification of buildings for which plans are being made by local architects and estimated cost: Hotels, \$200,000; office and commercial buildings, \$3,060,000; residence and apartment buildings, \$2,389,000; college and school buildings, and lodge buildings, \$4,210,000; hospitals, \$1,080,000; theaters, \$285,000; public buildings, \$620,000; churches, \$646,000; factory buildings and warehouses, \$2,110,000.

OTHER OHIO CITIES

Cincinnati in 1915 will erect a new court house and jail, a new high school, at least one and possibly two intermediate schools, a municipal auditorium, two new buildings for its municipally owned university, a new central Y. M. C. A. building and a colored branch, at a cost of \$5,000,000. It will also open to the public its new general hospital, erected at a cost of over \$3,000,000.

In Columbus the improvement in building operations and prospects during December were encouraging and architects in that city expect conditions to continue on the upward trend for some time to come. At the recent elections in that part of Ohio there was a much better response to the bond issues for schools and other public buildings, and there is no reason why even more favorable action might not be confidently expected on the bond issues for public buildings which will be submitted within the next few months. Church and school buildings which have been temporarily held up during the past few months because of business conditions are rapidly feeling the inspirations of the renewed hopes in the world of finance and business. Several jobs of this character are now in a good way to be pushed to the front because the men back of them are fully alive to the bettered conditions. Many requests for commercial buildings have been made. Business men who have been keeping close to the shore during the past few months have read the signs of the times, which point to a year of great prosperity to the United States. Additional business buildings and more factories will be needed to care for the additional manufactured products which America will be called upon to supply. One architectural firm reports that there has been an unusually early demand for plans of all kinds, especially in the smaller towns throughout central Ohio. Many lodges which have been planning to get better quarters, were deterred from making the move in the latter part of 1914, but now that the business skies have brightened they are clamoring for plans and specifications of the lodge buildings which they will want pushed to completion. Contractors and builders throughout Columbus and central Ohio have also caught the inspiration of the good times to come and they are predicting that 1915 will prove one of the record-breaking years, unless all signs fail. And at this time, there are no indications that these signs will fail.

PROSPECTS IN CHICAGO

It is reported that Chicago architects are busy with preliminary sketches of work which will get under way in the spring. It is expected that money will loosen up soon and then a number of plans which have been pigeonholed will be brought out and operations will start. This prospective work includes factory buildings, large apartment houses, and in fact all classes of structures. The sole reason why they have not gone ahead was because lenders locked their safes and put their check books in cold storage. And now that the genial spirit of confidence is once more gaining sway this construction work, grown somewhat bulky through long accumulation, points to what may possibly develop into a vernal freshet of work. Turning from prospects to actual developments, there is reported some increased activity in flat building business, under construction mainly by so-called speculators and contractors. On the outskirts of the city considerable actual building is in progress and the diminution in construction, as compared with a year ago, is quite moderate.

Architects in all parts of Indiana expect renewed activity in this line and are laying their plans accordingly. Many projects will materialize in the spring, and some will be taken up in the immediate future.

OUTLOOK IN WISCONSIN AND MINNESOTA

Architects and contractors in several of the larger cities surrounding Milwaukee feel hopeful regarding the future, and most of them have one or two good sized projects to start the spring work with. Not only the architects, but the manufacturers are taking a more hopeful view, and all are talking increased business for next year.

The general feeling is the same at Green Bay. A large amount of building is predicted for the ensuing year. Plans are in progress for factories, creameries, and other work of that sort. There are no stringent laws governing the building industry in Wisconsin, and the building enterprises under contemplation look very promising for an abundance of construction work next spring. The slogan of a well known banker in this state reads as follows: "You can buy and build cheaper today than any time within the last five years."

In Minnesota the prospects for 1915 are good. The railroads are planning a lot of new work, which will add considerably to the total volume now scheduled for this territory. The rate on loans is practically back to normal and after the money scare is over the architects in general look forward to a great boom. Lots of work which was postponed last fall undoubtedly will be undertaken in the spring. No single event has done more toward strengthening business confidence than the establishing of the new banking system, the full advantages of which have not yet been fairly tested or appreciated. The St. Paul railroads have finally decided to erect a new \$15,000,000 station, which ought to help the city considerably in the building line.

WORK IN THE WEST

Much building has been planned for Omaha in the early spring. Though reports from cities and towns in various parts of Nebraska and Iowa are usually conservative in their forecasts, there is a hopeful tone throughout the region, and in many instances the hope is founded on actual contracts for buildings. In Sioux City architects have been asked to submit sketches for several churches, which, it seems fair to assume, will be erected this year. Several fraternity club houses will likely be built. There is no evident diminution in county and municipal improvement work projected. The county has authorized the sale of bonds to cover the cost of the erection of a court house to cost half a million dollars. Municipal improvements will equal or exceed those of last year, if present plans materialize, and there seems to be no reason why they should not.

Differences of opinions exist among architects and builders in St. Louis concerning prospects for renewed building activity in that city. They say it depends largely upon the loosening up of the money market so that prospective builders can secure loans at advantageous rates.

About seventy per cent of the bond elections this year throughout Missouri and Kansas resulted favorably to the issue of bonds, and this is interpreted as a good sign of a prosperous business year.

EASTERN SITUATION

Reports from numerous cities in the eastern states look at the bright side of the situation. Booms are not looked for, but healthy revival of building operations is contemplated.

Some localities report the money markets practically back to normal conditions; others indicate only progress in that direction. All, however, show marked improvement as compared with a month or two ago. Buffalo gives the tip as coming from inside banking sources that money will loosen up. And the significant statement comes from some cities that bankers are now tending to favor building operations more than they did a month or two ago, because new buildings add to the material welfare of the country.

Many municipalities which have had public works in contemplation for some time are taking steps to begin operations in the near future. This will stimulate building and increase the employment of labor.

Though in New York there is no more actual planning going on

than heretofore, a great many sketches and preliminary drawings are being made which foreshadows an unusual amount of spring work. The opening of the New York Stock Exchange has undoubtedly helped a great deal toward restoring confidence. Many clients having large investments in stocks who had held off on going ahead with their building plans during the interim of the closing of the exchange have ordered work to begin immediately. Speculative building especially has taken a big brace as many large operations have already been undertaken, and the outlook for residential and commercial work is very bright to say the least. The rate of money stands about the same, but the prevailing opinion is that money will shortly loosen up considerably. Taken altogether the architects do not see any reason why 1915 should not start with a rush and continue so throughout the year.

Reports are similar from other eastern cities where large sums of money are accumulated and which naturally seeks investment in the most profitable way. The recent railroad rate decision figures to a considerable extent in all eastern predictions of building revivals. The general opinion is that business will be helped by increased revenues earned by the railroads.

The Inch Board

The inch board is the most important single item in the lumber industry, and the general prevalence of the inch board together with the ease with which it may be obtained has led to its adoption for many uses that primarily called for other thicknesses. For example there is nothing unusual today about seeing church pew ends, barber chairs, frames and other thick work made up from inch boards glued together into whatever thickness is desired. This is especially true in oak. In birch one may find thick stock used for arms and frames more commonly than in oak, and now and then one finds the thick stock in oak, but there is enough use of inch boards built up into thick stock to cause some wonder as to just why it is.

During the winter there have been calls for thick oak, which have brought out the fact that as a rule there is a very limited quantity of thick oak made, the greatest percentage being inch boards. Buyers seeking wagon and implement stock have cleared up in some of the hardwood lumber centers such items as 2½, 3, 3½ inch oak plank, and while this created a little flurry in the lumber situation, it is found after a thorough investigation that a demand that would clean up all of such thick oak would really take up only a small percentage of the oak lumber stock on hand.

The inch board is a much more important item in the lumber trade today than it was ten or twenty-five years ago. In the days gone by there were periods when inch oak was made only in limited quantities and most of the accumulation came from siding and from reducing logs to specific dimensions. In the earlier days many of the boards were made two inches thick and three inches and a fair percentage 2½, 3½ and 4. Today when one compares the total of thick planks with the lumber cut, the item is rather insignificant.

There are several explanations for this change in lumber stock dimensions and for the general prevalence of the inch board. There is not so much call for thick oak as formerly. Thick oak was used for all kind of tanks, tubs, bogsheads and vat work much more extensively than it is today. When this call was general nearly every oak mill cut much of its best stock into thick oak planks, and a fair percentage of the common stock into two inch oak and even a fair share of three inch oak for bridges and railroad crossing planks.

Today the best demand for high-grade thick oak is for fitches to be made into quartered veneer. Naturally the man who has good stock for thick oak is inclined to reduce it to quartered fitches and market it green to some veneer mill, or put in a veneer saw and work it up himself. This demand consumes much oak that originally went into thick planks. Meantime the market for thick oak has been so erratic and uncertain from year to year that some millmen have

become afraid of it. At certain periods in the past those who have had a stock of thick oak at the right time have made a sort of killing with it, but this happens only once in a while and between times it is often found expensive to carry. The result is that people turn more to inch oak and today the inch board is easily the biggest thing in the oak lumber market.

Whether the inch board should continue in this prominence or whether other thicknesses should be used is a question that needs serious attention on the part of the lumber fraternity. This question may take in many other hardwoods than oak. The inch board has become such a habit in all lines of hardwood that when there is a slow period and an accumulation of stock it is always found that the biggest part of this burden is in inch boards.

It is time for the lumber manufacturing fraternity to make a careful study of the consumption of lumber in the various lines of importance to the end that there may be obtained some guiding light as to the comparative quantity which should be made in inch boards and in other thicknesses. Now and then we see evidence of a need for various other thicknesses which give a hint that profit might accrue from a more careful study of the needs of the country.

The inch board is an easy thing to make and it is so standardized that it is sure of a market at some price some time or other. This is easily the explanation of why we have so many inch boards, but it is not a good enough reason in this age of analytical study and specializing. The first advance scored in the lumber market the past fall was in 5/4 and 6/4 gum boards, not inch boards. The box factory trade needed boards for resawing that were a little thicker than the regular inch stock, and those who had been thoughtful and forehanded and had cut a fair percentage of 5/4 and 6/4 boards found the first and best market, and even today where there is a demand for this thickness it generally carries with it a better price comparatively than is offered for inch boards.

Only one modern sawmill is operated in the territory of Hawaii.

In district 4 of the Forest Service, with headquarters at Ogden, Utah, lightning caused thirty-six per cent of this year's fires and campers twenty-seven per cent.

As showing the possibilities for tree growth in regions where irrigation has to be depended upon, it is pointed out that Boise, Idaho, has as many as ninety-four different kinds of ornamental and shade trees.

Interesting Traffic Developments

A hard fight is being made to prevent an increase in the hardwood rates between Helena, Ark., and Omaha, Neb. In a brief submitted to the Interstate Commerce Commission last week the complainants state that the respondents have glossed over the proposed action without making any point in its justification. The carriers propose an increase of the rate from nineteen to twenty-four cents. It is proposed to take Helena out of the Memphis group, where it has been from the time of the first tariff, and put it in the next higher group. It is stated that this rate will destroy the business now being done between the Helena district and Omaha territory. The trade is principally in cottonwood and gum. The case will be argued before the commission January 13.

The Ford Brenner Lumber Company of Alexandria, La., has submitted a brief in its case against Morgan's Louisiana & Texas Railroad and Steamship Company. The question involved is that of awarding reparation on transit logs from points on the Alexandria branch of the defendant carrier. The claim of the carrier that an effort is being made to make transit privileges retroactive, is denied. The impracticability of describing the various kinds of hardwood logs from points on the defendant's line is gone into fully. The carrier claims that the different kinds of logs should have been listed on freight bills. This the lumber company says it cannot do as most of the cars are shipped from stations where no agent is maintained. The provision requiring the specification of the kind of wood is declared to be unfair. All logs handled are oak, ash, hickory or gum. The milling-in-transit rates are attacked as unreasonable and the tariff provisions for back hauling are inadequate, it is said.

Much commendation is heard at the Forest Service of the action of Governor Walsh of Massachusetts in suspending the open hunting season because of the drouth which made the danger of forest fires unusually great. This action is being called to the attention of the governors and conservation commissions throughout the country in the hope that similar action will be taken, if not this year, in the future.

In many states great damage has been caused by allowing hunters to enter the forests when they were like tinder boxes. Fires almost certainly result and thousands of feet of timber are destroyed.

Discussion of the adoption of the metric system is again attracting considerable attention in Washington. Representatives and senators from the lumber districts are not in favor of any legislation to this effect. It is certain that there is enough strength in Congress to defeat a bill of this kind if it should come up. It is being argued that now is just the time that a change in the system of weights and measurements could be made with least annoyance. With the volume of European business and home trade at the lowest points in years, sawmill and other machinery could be adjusted to new measurements at a minimum of inconvenience, it is declared.

Reparation has been granted in the following cases before the Interstate Commerce Commission, which are of direct interest to the hardwood industry:

American Lumber and Export Company versus Louisville & Nashville Railway; Crockett Lumber Company versus Central of Georgia; I. Lurya Lumber Company versus Chicago & Eastern Illinois; W. E. Thomas Lumber Company versus the Atchison, Topeka & Santa Fe; Castleman Bros. Timber Company versus Chicago & Alton; Ozark Coopers and Lumber Company versus Frisco; Clearfield Lumber Company versus Chesapeake & Ohio; Foster Lumber Company versus Atchison, Topeka & Santa Fe; Roddis Lumber and Veneer Company versus Detroit, Grand Haven & Milwaukee Railway Company; Stout Lumber Company versus Chicago, Rock Island & Pacific; Paine Lumber Company versus Lake Shore & Michigan Southern; Bord Bros. versus Louisville & Nashville; Bristol Door and Lumber Company versus Norfolk & Western; Wm. Foerster & Co. versus Nash-

ville, Chicago & St. Louis; South Texas Lumber Company versus Missouri, Kansas & Texas; Saginaw Lumber and Lumber Company versus Louisville & Nashville; H. Marks versus Louisville & Nashville; Bristol Door and Lumber Company versus Norfolk & Western; Krauss Bros. Lumber Company versus Yazoo & Mississippi Valley; Goshen Veneer Company versus Illinois Central; Butterfield Lumber Company versus Illinois Central; J. W. Darling Lumber Company versus Louisiana Railroad and Navigation Company; American Tie and Timber Company versus Pennsylvania Company; Gulf Refining Company of Louisiana versus Kansas City Southern; Louisiana Red Cypress Company versus Texas & Pacific; John Dulweber Company versus Yazoo & Mississippi Valley; Natalbany Lumber Company versus Illinois Central, and Krauss Bros. Lumber Company versus Yazoo & Mississippi Valley Railway.

The case of the Bryant Lumber Company against the Chicago, Rock Island & Pacific has been dismissed by the Interstate Commerce Commission. The case of the Grand Rapids Lumbermen's Association against the Grand Rapids & Indiana, has also been dismissed.

In the case of Dierks & Sons Lumber Company versus the Missouri Pacific, the carrier has been ordered to pay reparation on account of a discriminatory switching charge at Kansas City.

The claim of the Berthold & Jennings Lumber Company of St. Louis against the Alabama, Tennessee & New Orleans railway has been dismissed. Unreasonable rates on hardwood lumber were claimed. The case of J. G. Kulzer versus the Great Northern Railway has been decided in favor of the carrier. It was alleged that charges had been collected on excessive weights.

A complaint in which reparation is demanded has been submitted by the Vaughn Lumber Company of San Antonio against the Louisiana & Arkansas railway.

Forest Products Federation

The committee of five appointed at the preliminary meeting of lumbermen on December 17 to make arrangements for the mass meeting on February 24 and 25, held a conference recently in Chicago. On behalf of the various associations and interests represented, the committee has developed preliminary plans for bringing to a head at the coming mass meeting the various subjects and problems connected with the promotion of lumber. The enthusiasm displayed is equally strong among producers and distributors, and there is great promise that a definite policy will be developed in promoting wood, both independent of, and in competition with substitutes.

The general committee at its meeting appointed E. A. Sterling, forest and timber engineer of Philadelphia, to act as secretary in arranging the program and publicity for the February meeting. R. S. Kellogg, the new secretary of the National association, will act as treasurer of the federation and take an active part in the arrangements.

The committee also appointed five standing committees which will report definitely on as many subjects to the mass meeting on February 24 and 25. Announcement will be made of the personnel of these committees as soon as acceptances are received to the appointments made. The committee of five in itself becomes essentially an executive committee in control of all arrangements.

Of 2,000,000 sheep annually grazed in the state of Utah, more than 1,000,000 are on the national forests, or, including lambs which are fattening for market on the forest ranges, over 1,750,000.

In addition to his own fire detection system, the supervisor of the Palisade national forest, Idaho, was notified of each fire by from five to ten different local settlers, who thus showed their cooperation in working for fire suppression.

JOHN W. McCLURE, PRESIDENT

S. M. NICKY, FIRST VICE-PRESIDENT

FRANK MAY, SECOND VICE-PRESIDENT

Meeting of Traffic Association

The second annual meeting of the Southern Hardwood Traffic Association was held at Memphis, Tenn., January 5, with sixty-five firms represented and more than eighty-five per cent of the total membership. A luncheon was served, reports by retiring officers were received, and as the result of an election, officers for the ensuing year were chosen as follows:

PRESIDENT, John W. McClure, Bellgrade Lumber Company;
FIRST VICE-PRESIDENT, S. M. Nickey, Green River Lumber Company;
SECOND VICE-PRESIDENT, Frank May, May Brothers;
DIRECTORS, George D. Burgess, Russe & Burgess; Walker Welford, Chickasaw Cooperaage Company; Elliott Lang, R. J. Darnell, Inc., and William Pritchard, J. W. Wheeler & Co. George Land of the Lamb-Fish Lumber Company holds over for another three-year period. This makes five new directors and these, with the ten holdovers, compose the governing board of fifteen.

The following were among the speakers at the meeting: Frank F. Fee of the Fee-Crayton Hardwood Lumber Company, Dermott, Ark., who advocated a strong merchant marine by the United States; John M. Woods, East Cambridge, Mass., who explained the reasons for his belief that business conditions are improving, and H. J. Dudley of the Dudley Lumber Company, Grand Rapids, Mich., who directed his remarks to the railroad situation, particularly in southern Michigan.

THE PRESIDENT'S REPORT

A history of the association's activities during the past year was summarized in the reports read by the president, George D. Burgess, and Secretary J. H. Townshend. An epitome of the president's report follows:

The association is two years and five months old, and has been eminently successful in making money for its members. During the past year seven complaints and three applications for suspension of tariffs were filed with the Interstate Commerce Commission. One of them, that of the Bellgrade Lumber Company, was decided in favor of the association, and one, the Anderson-Tully case, was decided adversely. Another important case, which covers advances from Arkansas, Louisiana, and Memphis to Ohio river crossings, and all points west of the Mississippi, is expected to be decided in the immediate future.

For more than a year negotiations have been under way between the association and the I. C. and the Y. & M. V. railroads to put into effect a yarding arrangement at Memphis which will enable dealers to bring lumber to Memphis and handle it on a proportionate through rate. There is now some prospect that the plan will be worked out in a satisfactory manner.

On January 13 a very important hearing will begin at Memphis. It relates to a general advance to the Ohio river crossings averaging eighteen per cent. The board of directors has secured the services of Attorney

Luther M. Walters of Chicago to assist the association's attorney, John R. Walker, in presenting the case at the hearing.

It was suggested that the association authorize the secretary to route the shipments. This would give the organization a great leverage with the railroads, and it could be done without danger of falling foul of anti-trust laws.

President Burgess expressed confidence in the business outlook and saw no ground for discouragement with the prospects. The tide that has so long been ebbing has at last turned and is again setting toward prosperity.

REPORT BY THE SECRETARY

Secretary Townshend's annual report goes into the details of the work done by his office during the past year. The period included is that from January 1, 1914, to January 1, 1915:

It was announced that on February 17, according to the ruling of the Interstate Commerce Commission in the Bellgrade Lumber Company case, the new rates will become effective. These rates apply to oak and other hardwoods to bring them down to those in force on gum from points north of the Southern railway in Mississippi, and those south of that line; that is, eleven and ten cents respectively. It is figured that the reduced rates will save \$17,000 a year to Mississippi lumber shippers.

During the year the association collected claims for its members amounting to \$14,310, and returned as not collectable claims aggregating \$1,064. Some of these claims were barred by the statute of limitation. At the present time the association has pending claims amounting to \$10,734. The majority of these claims had already been handled by members.

The members of the association have distributed several thousand copies of a book, "The Lumber Industry and the Railroads," written by the association's attorney, John R. Walker. The book deals with the five per cent advance in rates which was recently granted the railroads north of the Potomac and Ohio rivers. The association opposed the advance and was one of the few lumber associations that did so.

During the past year the officers of the association have been active in an endeavor to secure better weighing conditions. The results of these efforts are apparent in better conditions than were ever before enjoyed in the history of the lumber industry.

The members depend more and more upon the secretary for rates, and in a number of instances he is quoting members all the rates they use.

The Interstate Commerce Commission in a recent decision held that shippers were entitled to an allowance of 500 pounds dunnage on logs as well as lumber. When that decision came out, the association at once took the matter up with the carriers and succeeded in procuring the allowance in a number of cases, and the prospects are encouraging that all carriers will make the allowance.

It has not been customary for carriers to post at their stations notices of embargo, and that has worked hardships for some of the lumber com-

panies. This matter is now before the Interstate Commerce Commission, and it is believed that it will be adjusted in a few months.

A bill introduced in Congress to amend the Harter law makes the owner, manager, agent, or master liable for loss or damage arising from force or error in navigation or management of vessels. The measure has received the hearty support of the exporting members of the association.

The secretary announces that he is prepared to answer questions and furnish information regarding the scope and workings of the Federal Trade Commission which recently came into power. Many inquiries have been received concerning the new law under which the commission acts.

The standard bill of lading, which allowed four months within which to file damage claims, was upheld by the Supreme Court more than a year ago. Many lumbermen had suffered on account of the short time allowed for filing these claims. Lumbermen are now all familiar with the fact that claims must be submitted promptly.

The members of the association have been advised to insist upon six per cent interest in the settlement of all overcharge claims.

A motion offered by F. F. Fee concerning a merchant marine measure received the unanimous support of the members. The motion provided for a committee of three to digest the present shipping laws and the bill now before Congress to form a \$30,000,000 shipping corporation. The committee appointed in compliance with the terms of the motion consisted of J. W. McClure, Elliott Lang and F. F. Fee.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 844—Wants to Know Difference in Strength Between Black Walnut and Red Birch

Springfield, Mass., December 22.—Editor HARDWOOD RECORD: Can you advise us the difference in strength between black walnut and red birch?

HARDWOOD RECORD has replied to this inquiry as follows:

Red birch, according to the only available figures on this question, as prepared by Sargent, is 31 per cent stronger and 35 per cent stiffer and more elastic than black walnut. Of course, walnut is strong enough and stiff enough for ordinary purposes as instanced in the old-fashioned furniture which has been handed down from generation to generation, and is still in use. The use of walnut in gunstocks is also a very rigid test.

B 845—Wants to Buy Hardwood Parts of Wheelbarrows

Milford, Mass., December 28.—Editor HARDWOOD RECORD: I am referred to you as being in position to give me information regarding mills manufacturing finished hardwood materials. What I desire is to get in touch with mills that will make for me the finished hardwood parts of a wheelbarrow. I would especially desire to communicate with mills located in Massachusetts, Vermont, New Hampshire and Maine.

HARDWOOD RECORD has advised the names of a few concerns in this territory which might be in position to get out this stock, but would appreciate further information from concerns that have not already had the inquiry.—EDITOR.

B 846—Basswood Logs for Export Sought

Ansonia, Conn., December 30.—Editor HARDWOOD RECORD: Can you place us in touch with a source of supply for several million feet of basswood logs for export for Europe? These must be freshly felled, unfloats and free from knots on the surface, straight and unpeeled, 7 to 26 inches in diameter and in lengths of 7 to 10 feet.

It would appear from the above that either northern or southern basswood would be acceptable, and anyone having it to offer can have the address of this prospective customer by writing HARDWOOD RECORD.—EDITOR.

B 847—Wants Market for Basswood Cores

New York, N. Y., January 5.—Editor HARDWOOD RECORD: We are in position to furnish carload lots of basswood cores. These cores are from good, sound basswood logs, and would all be sound. They are 3 feet long and 5 inches in diameter. Do you know of anyone who would be interested in these?

HARDWOOD RECORD advised that in its opinion the best uses of cores, particularly in basswood, would be in the manufacture of excelsior, and that it would possibly pay to investigate the cost of installing plant if the supply is a continuous one, otherwise the cores should be marketable to excelsior manufacturing companies.—EDITOR.

B 848—Has Hardwood Shingles to Market

Strang, Okla., January 4.—Editor HARDWOOD RECORD: I am looking for a market for walnut, white or red oak and cottonwood shingles. Will contract or fill orders in carload lots. Please notify the trade.

The name of this party will be given to correspondents who wish it.—EDITOR.

B 849—Wants to Buy Hickory Golf Sticks for Export

New York, N. Y., January 5.—Editor HARDWOOD RECORD: I will be much obliged if you will give me a few names of responsible mills which are able to manufacture hickory golf sticks for export, and as you know, this stock must be perfect in every respect.

Those interested will be supplied with this party's address upon application to this office.—EDITOR.

Clubs and Associations

Plans for Gum Meeting About Completed

It is announced from the office of the Gum Lumber Manufacturers' Association that two prominent speakers will address the coming annual meeting of that organization, which will be held at the Hotel Gayoso, Memphis, January 16. These gentlemen are F. R. Gadd, Chicago, who will speak on "Cost of Production" and H. D. Tiemann, United States Forest Service, Madison, Wis., who will talk on the subject of kiln-drying lumber.

Secretary J. M. Pritchard has issued the following supplementary statement regarding the meeting.

We wish to extend you another invitation to attend the annual meeting, January 16, 1915. This meeting is going to be a regular old-time family gathering. We want every manufacturer of gum lumber to attend and take part in the proceedings. What we need is a real exchange of ideas among gum lumber manufacturers. We want everybody to get up and talk right out, tell in a plain, matter-of-fact way about things that have been bothering us, and explain how we have overcome difficult problems.

Never before in the history of the lumber business has there been such urgent need of co-operation between lumbermen. There should not only be co-operation between lumbermen, but we should go a step further and co-operate with the consumers of lumber. There are many ways in which the lumbermen and the consumers of lumber may work together for their mutual benefit. Heretofore lumbermen have not considered it necessary to help solve the problems of the consumers, but it is clear that by working together mutual benefit will be derived and a friendly rather than an antagonistic feeling will be brought about between these two branches of the lumber industry.

Memphians to Hold Meeting Prior to Gum Convention

The Lumbermen's Club of Memphis has announced that it will hold its installation meeting at the Hotel Gayoso, Friday evening, January 15, and that it will entertain at that time all of the delegates to the annual of the Gum Lumber Manufacturers' Association, which is to be held the following day. Saturday, January 16, is the date for the regular meeting of the club and it was originally planned that the officers chosen at the recent annual election should be installed on that day. In view of the fact, however, that this meeting would occur on the same date as the annual of the Gum Lumber Manufacturers' Association, it was decided to hold the meeting Friday evening. It was also the desire of the officers and members of the Lumbermen's Club of Memphis that the delegates to the Gum Lumber Manufacturers' Association should be entertained and this, as already suggested, will be done. It is anticipated that this will be an unusual meeting of the club. All newly elected officers will be installed and the retiring ones will submit annual reports. In addition to these, it is planned to have an address by Chas. Coolidge Parlin, manager of the division of Commercial Research, who is connected with the Curtis Publishing Company, Philadelphia. He will talk on the general subject of "Merchandising" with particular reference to the best means of proceeding with the opening of new markets. He will deal extensively with the question of publicity as a means of broadening the outlet for goods of almost every description.

Call for Meeting of Yellow Pine Manufacturers

HARDWOOD RECORD is in receipt of the following communication from John L. Kaul, chairman of the recently formed organization of yellow pine manufacturers:

To Yellow Pine Manufacturers:

Pursuant to the resolution at mass meeting of yellow pine manufacturers held at New Orleans on December 9, to adjourn to meet on call of the chair, I am hereby issuing call for such meeting to be held in New Orleans, La., at the Granewald hotel, at 10 a. m. on Tuesday, January 19, 1915.

The purpose of this meeting is to effect the final organization of the Southern Pine Association, and you are urgently requested to answer the call by your presence in New Orleans at the time and place mentioned.

It is requested that you see as many of your neighbors as possible, and urge upon them the importance of attending this meeting.

Hemlock and Hardwood Association Issues Program of Annual Meeting

R. S. Kellogg, secretary of the Northern Hemlock and Hardwood Manufacturers' Association, has just gotten out an attractive program covering the proposed proceedings of the sixth annual meeting of that organization to be held at the Hotel Pfister, Milwaukee, Wis., January 26-27. The order of business will include many interesting numbers and the speakers will be men recognized in their respective lines. Among the reports and

addresses will be an address on "Traffic Service," by B. G. Dahlberg, St. Paul, Minn.; "The National Lumber Manufacturers' Inter-Insurance Exchange," by Chas. F. Simonson, Chicago; "Compensation Insurance and Its Cost Under the Wisconsin Law," by Chas. H. Crownhart, Madison, Wis.; "The Assessment of Timberlands in Wisconsin," by W. A. Holt, Oconto, Wis.; "The Forest Products Federation," by R. S. Kellogg; "Camp Missionary Work," by Matt Daly, Duluth, Minn.; "Manufacturing Lumber to Fit the Needs of Consuming Factories," by W. W. Brown, Two Rivers, Wis.; "Manufacturing Birch for Interior Finish," by Enos Colburn, Green Bay, Wis.; "Timber Utilization," by O. T. Swan, Washington, D. C.; "The Effect of Carrying Charges Upon Timber and Lumber Values," by C. H. Worcester, Chicago. In addition there will be a discussion of "Realization Values in Lumbering."

New officers will be elected for 1915. In the evening of Tuesday, January 26, there will be a dinner at the Hotel Pfister and theater party at the Majestic for members, their wives and guests. This will be followed by a smoker at the Schlitz for the men.

Association Secretary Changes

Two important changes in lumber association secretaryships occurred on the first of the year. John E. Rhodes resigned as secretary of the National Lumber Manufacturers' Association to take a similar position with the recently-formed Southern Pine Association, and R. S. Kellogg succeeded Mr. Rhodes in the national body, and at once tendered his resignation as secretary of the Northern Hemlock and Hardwood Manufacturers' Association.

Both of these men bring abundance of experience to their new positions. Each is in the prime of life, at the age of forty. Mr. Rhodes is a native of Ohio, Mr. Kellogg of New York, but both left these states in early life.

Mr. Rhodes was educated at the University of Minnesota and began his business life as a stenographer in the service of the Northern Pacific Railway, and soon after accepted a position in the office of the Great Northern Railway at St. Paul. At his next move he became purchasing agent for the Minnesota Logging Company. Soon after that period he tried his hand at newspaper work by becoming a reporter on the Minneapolis Tribune. In 1898 he became associated with the Mississippi Valley Lumbermen's Association, and the next year he was appointed secretary of that association, and remained in that position until the consolidation of that organization with the Wisconsin Valley Lumbermen's Association, under the

name of the Northern Pine Manufacturers' Association. He became the secretary of the new organization, and served also as secretary of the Northwestern Hemlock Manufacturers' Association. He did efficient work at Washington during the fight for tariff on lumber in 1909.

He was again in newspaper work, connected with the Tribune, and served also at St. Paul as secretary to Frederick Weyerhaeuser. In 1912 he was appointed secretary of the National Lumber Manufacturers' Association, with headquarters in Chicago, and held the position until the beginning of the present year.

Mr. Rhodes married Miss Louise Robinson, of Minneapolis, in 1898. When he assumes his new duties at the headquarters of the Southern Pine Association, he will make his home in New Orleans.

Royal S. Kellogg became a resident of Kansas when eight years old and began facing the realities of life as a cowboy on the plains. After completing the course of the public schools, he entered the Kansas State Agricultural College at Manhattan, from which he graduated in 1896. Three years later he took a post-graduate degree at the same institution. He spent one year as a district school teacher in Kansas, and early in 1901 he entered the United States Forest Service and during the next nine years he did excellent work for the service. A number of valuable reports published during that period were largely the result of his planning and labor. One of these was the series of yearly reports of the country's lumber output. He made studies of tree planting and forest conditions in a number of localities in the West. Later he visited Alaska and wrote a report on forests in that northern country.

In the spring of 1910 Mr. Kellogg resigned from the Forest Service to accept the secretaryship of the Northern Hemlock and Hardwood Manufac-

turers' Association, with headquarters at Wausau, Wis., and held that position until his recent resignation. The best commentary on his association work is contained in the fact that he has been called to a larger and more important field.

In 1901 Mr. Kellogg married Miss Clara Fry, of Bentonville, Ark., and their two children, Ernest and Gifford, are aged eleven and three respectively. Mr. Kellogg's successor as secretary of the Northern Hemlock and Hardwood Manufacturers' Association has not yet been announced.

Interest in Manufacturers' Convention Increasing

Every indication is that the annual convention of the Hardwood Manufacturers Association, which is to be held at the Hotel Sinton, Cincinnati, January 28 and 29, will be a record-breaker in attendance. Secretary Weller of the association states that in his travels he finds an unusual interest in the meeting this year, due to a strong desire on the part of all lumbermen and consumers to get together and talk things over.

In view of this, the program makes provision for a general discussion of business conditions in which all those on the floor of the convention will participate. There will be no resolution passed or concerted action taken, the idea being entirely to develop a free and open discussion of the situation to bring out individual views.

Another subject that will be discussed on a scientific basis but in language easily understood by the lumbermen will be that of cost accounting, by L. V. Estes of Chicago. Mr. Estes is widely known in sawmill circles and has specialized on this subject for years.

Another subject of prime importance will be handled by H. S. Graves, United States forester, who will speak on present day forest problems. Mr. Graves will incorporate in his address a vast amount of useful information that he has gathered in his work as government forester.

The one vacant place remaining on the program is an address explaining the new banking law and its effect on general business. The name of the speaker will be announced later, and he will be one of national prominence and amply able to discuss the new currency law from the foundation to the many intricate technical details that arise in its application.

Important Conference

A special meeting of the executive committee of the National Hardwood Lumber Association was held Tuesday, January 5, at the association headquarters, in response to a request from the Federation of Furniture and Fixture Manufac-

turers which is composed of over five hundred of the largest hardwood lumber buyers in the United States.

The conference occupied most of the day and Secretary Fish states that there will be further meetings during the present month, and that the object of these conferences is to bring about a better understanding and closer co-operation between the National Hardwood Lumber Association and the Federation of Furniture and Fixture Manufacturers.

St. Louis Exchange Elects Officers

The election of the officers of the Lumbermen's Exchange of St. Louis, held in the rooms of the exchange on January 4, resulted as follows:

PRESIDENT—Charles E. Thomas of the Thomas & Proetz Lumber Company.

VICE-PRESIDENT—E. H. Luehrmann of the Chas. F. Luehrmann Hardwood Lumber Company.

DIRECTORS—F. H. Smith, Smith-Suehne Lumber Company; William Lothman, Jr., Lothman Cypress Company; Henry Boeckeler of the Boeckeler Lumber Company; Thomas E. Powe, Powe Lumber Company; W. W. Milne, Milne Lumber Company; Franz Waldstein, Waldstein Lumber Company; F. C. Moore, Moore-Jurden Lumber Company.

ARBITRATION COMMITTEE—T. J. Noser, Noser-Eppler Lumber Company, chairman; J. L. Benas, Waldstein Lumber Company; C. E. Hascall, Pickrel Walnut Company; Louis Krug, Krug Lumber Company; Alcee Stewart, Alcee Stewart & Co.

On Tuesday, January 12, the new board of directors will hold a meeting to elect a secretary and appoint a treasurer. The present secretary, Walter D. Dodd, who has made one of the best secretaries the exchange has ever had, will be re-elected and the present treasurer, W. W. Milne, will be named as the treasurer. It is a custom to name one of the board of directors to act as treasurer and as Mr. Milne is again on the board, he will be named to succeed himself.

J. E. RHODES, SECRETARY OF THE NEWLY ORGANIZED SOUTHERN PINE ASSOCIATION.

R. S. KELLOGG, SECRETARY NATIONAL LUMBER MANUFACTURERS' ASSOCIATION.

Philadelphia Exchange Holds Reunion

The Philadelphia Lumbermen's Exchange held its social get together reunion and entertainment at the exchange rooms on the last afternoon of the old year. A large representation was present and after a Lucullan luncheon in Griffith hall, a select vaudeville show was enjoyed. The office and entertainment committee in charge is composed of John E. Lloyd, chairman; Herbert P. Robinson, E. A. Dudley, Joseph Hyde and Ralph Souder.

Monthly Meeting Cincinnati Lumbermen's Club

The Lumbermen's Club of Cincinnati held its regular monthly meeting at the Hotel Metropole, January 4, an unusually large and enthusiastic membership being out. General conditions were discussed and brought out a very optimistic feeling among the lumbermen. All were firmly of the opinion that the turning point for the better has been reached and that within sixty days or sooner there will be an excellent demand for lumber. No one present had any fear for the future and all statements were to the effect that business already shows much improvement.

The report of the river and rail committee occupied much time. Guy M. Freer, traffic manager of the Chamber of Commerce, was present and reported result of the recent conference at Chicago, to which meeting he accompanied the club's special committee, consisting of Emil Thoman, R. E. Dulweber and Charles Morris. These gentlemen with others will attend all other meetings of lumbermen and are prepared to offer testimony to counteract the railroads' contention for further increases in freight rates on lumber from both southern points and from Ohio river crossings. They believe that there is a good chance in co-operation with other lumber club and association committees to hold down at least some of the proposed advances.

One important matter decided at this meeting was the enlargement of the club's membership, a change in the constitution being made whereby retail lumbermen can now be admitted as members. The membership committee expects to gain a number of good firms for the roster.

The club as usual will take a prominent part in the coming convention of the Hardwood Manufacturers' Association which will meet here at the Hotel Sinton January 28 and 29. The entertainment committee will have club headquarters during the convention for the reception of all visitors and there will be plenty of cigars, etc., for the visitors. The club's committee will also assist the association in the feature entertainment. Every lumberman here will be a booster for the convention and do all possible to make it the big success it always is.

With the Trade

Harry Saxton Returns to Knoxville

H. N. Saxton, formerly manager of the Knoxville Saw Mill Company, Knoxville, Tenn., who left Knoxville when that mill was destroyed by fire has returned and opened offices in the East Tennessee Bank building. He will export and deal in general lines of lumber. Mr. Saxton has gained a very close personal acquaintance with nearly all of the foreign buyers during his business career, as he has made forty different trips abroad in the interests of his former concern. Mr. Saxton states that at present he is doubtful whether or not he will build his mill as he has a large acquaintance among southern hardwood manufacturers and is in position to handle hardwoods to advantage.

Change in Mershon's New York Organization

Harry J. Strong, formerly of Saginaw, Mich., who for several years has been the personal assistant of John D. Mershon, will be in full charge of the New York office of that organization. William D. Mershon has sold his interests and retired from the firm. The company's offices are located at 1 Madison avenue.

Mr. Strong's long experience peculiarly fits him for his new position. He has made a great many friends in New York through his connection with the Forest Products Exposition in 1914. At that time Mr. Strong was in continuous attendance at the exposition at the Grand Central Palace explaining to visitors the various articles in the redwood exhibit.

The John D. Mershon Lumber Company is the exclusive eastern sales agent for the Pacific Lumber Company and handles the stock of that organization through its various offices and salesmen for all territory east of the Rocky Mountains, both in Canada and the United States.

Carr Lumber Company Completing New Mill

It is announced by the Carr Lumber Company of Pisgah Forest, N. C., that plans for the company's new mill at that point will be ready about the middle of January. Plans will provide for a plant with double the capacity of the present mill. The Carr Lumber Company is cutting timber from the famous George W. Vanderbilt estate under a definite contract made some time ago.

Columbia Hardwood Lumber Company Buys Arkansas Properties

One of the most important transactions in this immediate territory in some time is the purchase by the Columbia Hardwood Lumber Company, Chicago, of the bankrupt properties of the Pemiscott Lumber Company, near Proctor, Crittendon county, Ark. The consideration was \$62,500. The properties consist of 2,500 acres of timberland, mostly oak and gum,

and three sawmills. There is also a dummy railroad connecting with the Iron Mountain and a tramroad which makes direct connection with the river. This transaction was negotiated by L. T. Fitzhugh, attorney for the purchasing firm. He is authority for the statement that the machinery will be overhauled at once and that operations will be resumed with the opening of spring. The Pemiscott Lumber Company went into bankruptcy about a year ago. Much local interest attaches to this transaction for the reason that it is understood that the Columbia Hardwood Lumber Company will open offices in Memphis.

Henry Maley Lumber Company Constructing New Plant

Active preparations have been begun by the Henry Maley Lumber Company for its new plant at Jackson, Miss. This company some time ago decided that it would remove its plant from Yazoo City to Jackson. It secured a site at that point and it has put a force of men to clearing this. It has secured eleven acres of ground. It is stated that the mill at Jackson will be of practically double the capacity of that formerly at Yazoo City. There was some discussion on the part of this company of operating at both Yazoo City and Jackson, but it has been decided to transfer the entire machinery of the company to Jackson. This firm operates quite extensively in Indiana, having mills at Evansville, Edinburg and Columbus.

Cincinnati Plant to Be Sold During Manufacturers' Convention

Henry C. Ezekiel, realty broker of Cincinnati, O., announces that the trustee's sale of the Maley, Thompson & Moffett Company's hardwood veneer and sawmill plant at Cincinnati will take place on the first day of the Hardwood Manufacturers' Association convention at Cincinnati on January 28. This sale will dispose of real estate, concrete and brick buildings, electric driven machinery, boilers, engines, motors and the entire equipment as an entirety. The sale will be sealed or open bids. Property will go to the highest bidder without reference to former cost or present value, subject to approval of creditors and confirmation by the United States district court at a meeting to be held in the office of the Hon. Charles T. Grove, referee in bankruptcy. Sale will be opened at 3 o'clock p. m.

Welsh Lumber Company Increases Yard Space

The Welsh Lumber Company, Memphis, Tenn., one of the newer concerns of that community, has taken over the offices and yards of the C. D. Hendrickson Lumber Company, South Memphis, which is adjacent to its present yards. The company's offices were formerly in the Randolph building, but have been moved to the new quarters.

C. M. Greene, formerly of Lee Wilson & Co. and the Coulson Lumber Company, has been with the Welsh Lumber Company since the first of the year.

The offices of the C. D. Hendrickson Lumber Company will be moved downtown from South Memphis.

Aberdeen Lumber Company Opens Chicago Office

R. S. Utley, who for several years has been handling the business of the Aberdeen Lumber Company of Pittsburgh, Pa., in Chicago and adjacent territory, is in charge of the office at 19 South La Salle street, which has just been opened by that company. The increasing volume of business in this territory has made the establishment of such headquarters necessary.

Large Fire in Philadelphia Yard

A terrible fire caused, is the supposition, by a spark from a passing locomotive, visited the extensive lumber yard of Charles Este Company, Inc., Glenwood avenue and Twentieth street, Philadelphia, on the morning of January 3. The yard, which is one of the largest in Philadelphia, with its immense drying sheds stocked with some of the rarest and most valuable hardwoods ever collected and which for age, length and width were remarkable, became an easy prey to the flames and was rapidly consumed. The flames leaped across Glenwood avenue and down Twentieth street and destroyed seventeen dwelling houses, causing altogether an estimated loss of about \$1,000,000.

Camden Firm Suffers Loss by Fire

C. B. Coles & Sons Company, extensive sash and door and lumber concern of Camden, N. J., was the unfortunate victim of a nearby fire on January 3. It is supposed that a lighted cigar carelessly thrown on the floor of the Kaighn's Point ferryhouse, started a fire running into a loss of about \$500,000. The flames gutted the ferry building, destroyed a large number of passenger cars of the Philadelphia & Reading Railroad Company adjoining, then spread to the Coles plant, a large part of which was wiped out, causing a damage placed at about \$150,000.

Half a Million Spent by Stearns in Freight

The magnitude of the business done by the Stearns interests of Ludington is indicated by the sum paid out for freight for the year ending November 30, 1914. The sum so expended approximates one-half million dollars, or, to be exact, \$469,952.94. This amount, together with the sum paid for labor during the past year, amounts to nearly one million dollars. The amount paid out for freight covers the charges on 13,116 carloads both coming in and going out of Ludington. This does not include several million feet of lumber and 175,000 barrels of salt shipped by boat.

The inbound freight amounted to 7,918 cars divided as follows: Logs, 6,745 cars; coal, 445 cars; cooperage, 54 cars; miscellaneous, 72 cars; lumber, 602 cars. This, with the exception of coal, represents raw mate-

rial brought to Ludington for manufacture and calling for a further expenditure of labor and money before being ready for market. The outbound shipments totaled 3,507 cars and this was divided as follows: Lumber, 1,970 cars; salt, 1,537 cars.

When it is considered that this tremendous business was carried on during a year of nation-wide uncertainty and depression in business, its magnitude can be better appreciated. In spite of quiet business conditions all over the country, the Stearns interests have gone ahead with their operations and are splendidly prepared to take the fullest advantage of the business revival which is sure to come.

Large Furnishing Store Uses Gum for Window Display

Garrett Lamb, president of the Lamb-Fish Lumber Company, whose residence is at Clinton, Iowa, was in Chicago this week attending the directors' meeting of that corporation.

Mr. Lamb told a representative of *HARDWOOD RECORD* that the big furnishing store of Dolan Brothers at Clinton, Iowa, is about completing a beautiful window display using figured red gum panels. According to Mr. Lamb's description, the wood is showing up with remarkable beauty which reveals the result of conscientious work all the way through from the veneer lathe to the finishing.

The panels are of unusual size, being up to sixty-four inches wide and seventy-two inches high. In fact, the company had considerable difficulty in finding a manufacturing institution that had presses large enough to make them up.

The stock is all selected gum and a significant part of the whole proposition is that Dolan Brothers finally chose gum after giving careful consideration to other woods ordinarily used for this purpose.

This is surely a remarkable commentary, and one which is entirely justified, on gum. The wood will be stained Circassian walnut. The display is ninety feet long and will give ample opportunity for effectively showing off the best features of figured gum cabinet work.

A Remarkable Machine

HARDWOOD RECORD has just received a circular describing a remarkable apparatus manufactured by Lewis T. Kline of Alpena, Mich. The machine is an automatic lathe which, operated by one man for ten hours, turns out from 30,000 to 50,000 wood turnings. The remarkable part of the apparatus is its extreme versatility as the variety of turnings which the machine can make is really remarkable. Mr. Kline has established a world-wide reputation in the manufacture of these machines and also of his exclusive manufacturing appliances.

Interesting Pamphlet from Arthur D. Little, Inc.

HARDWOOD RECORD has received an interesting pamphlet from Arthur D. Little, Inc., Boston, Mass., a well-known firm of chemists, engineers and managers. The pamphlet deals with various features of the present war situation as to probable effects upon our own sources of supply of raw materials, and analyzes the possibilities of this country's profiting through more intensive utilization.

Arthur D. Little, Inc., is one of the leading concerns in its line in the country. It makes a business of intensive study of plants for close utilization of resources as well as organizing plants and dealing with other questions of efficiency.

Big Lumber Company Re-opens Mill

At a meeting of the board of directors of the Lamb-Fish Lumber Company, Charleston, Miss., which was held in Chicago a few days ago, it was decided to immediately re-open the entire operation at Charleston. According to the expressed opinions of the entire directorate of this organization, the situation warrants its making this move, as the Lamb-Fish Lumber Company firmly anticipated active renewal of business, which will be gradually developed beginning with the early months of this year.

The Lamb-Fish Lumber Company is a concern manufacturing 40,000,000 feet of hardwood lumber a year under normal circumstances, and while it had an immense stock on its yards at the time it closed down at the beginning of the war, this stock of some 20,000,000 feet has been pretty badly broken and continued increase in inquiries has led the company to believe that it is good policy to replenish low supplies.

It has on its mill yard, in good condition and well protected, some

6,500,000 feet of logs, mainly oak, which, according to W. B. Burke, vice-president and general manager of the company, are the finest logs that his concern has ever put in. They are especially selected and when manufactured into lumber should make a mighty attractive proposition to discriminating purchasers.

Accompanying this notice is a cut illustrating the plant of the Lamb-Fish Lumber Company, which gives some idea of the magnitude of this operation.

Sixty-second Anniversary of Mr. and Mrs. L. V. Boyle

Mr. and Mrs. Clarence Boyle of Chicago have been spending the holidays at Pasadena, Cal., where they went primarily to attend the sixty-second wedding anniversary celebrated by Mr. Boyle's father and mother, Mr. and Mrs. L. V. Boyle, at 815 Atchison street. Others members of the family who were present were Mrs. W. B. McCorkle, Chas. E. Boyle and Mrs. A. N. Brown and her sons.

The old couple are both well past eighty years of age, but are remarkably well and enjoying serene old age. They went to Pasadena four years ago from Indianapolis, where they lived most of their lives. Mr. Boyle, Sr., is a retired lumberman and was married to Miss Mary Halsted at Michigantown, Ind., where they lived at that time.

W. M. Ritter Lumber Company Re-opens Mills

During the latter months of 1914 several of the mills owned by the W. M. Ritter Lumber Company, Columbus, O., were closed. At a meeting held just before the first of the year, it was unanimously decided, on account of optimistic reports from salesmen and generally better tone and increases in prices, that it would be a wise policy to re-open these mills and this policy was put into effect on January 1.

The mills were opened on an eight-hour basis, which will cause the company to cut more lumber than it did in 1914. The running will be increased only as the sales increase.

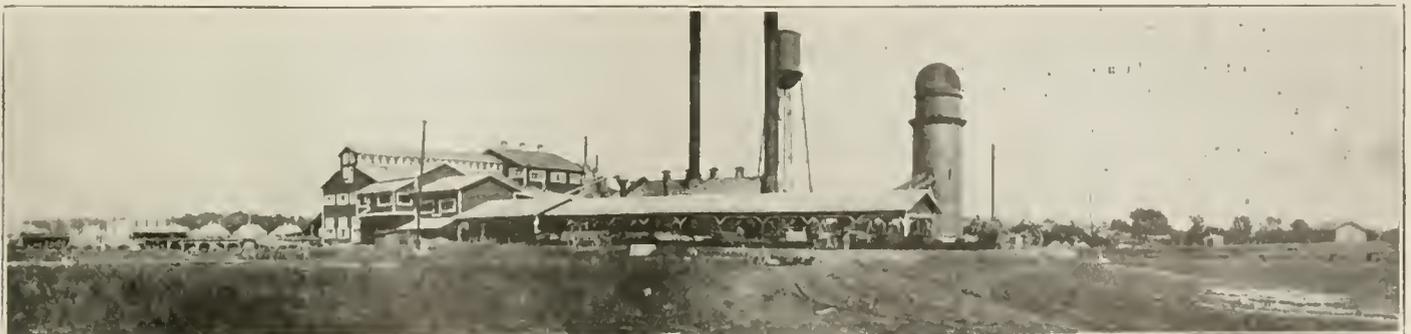

At the same meeting there were changes made in the positions of some of the employes. J. W. Mayhew, formerly sales manager, was appointed as assistant to the president; F. B. Pryor, former assistant sales manager, became sales manager; R. N. Horton, former sales manager of the central division, became assistant sales manager, and A. J. Williams, former sales manager of the eastern division, became eastern sales manager.

Pertinent Information

Lumbermen Win Export Gum Rate Case

The Southern Hardwood Traffic Association has won another signal victory before the Interstate Commerce Commission. J. H. Townshend, secretary and general manager, is in receipt of information from Washington that this body has held that, while the rate on hardwoods other than gum from Memphis to New Orleans is reasonable, a reduction is ordered from points in Mississippi to the Crescent City. All points north of the main line of the Southern Railway in that state are given a rate of 11 cents and all points below the main line of the same road in that state are given a rate of 10 cents. This decision was handed down in the case known as the Belgrade Lumber Company et al. vs. the Illinois Central and Yazoo & Mississippi Valley roads and has been pending before the commission for quite a while.

While the Southern Hardwood Traffic Association lost so far as Memphis proper is concerned, much gratification is felt over the reduction in rates from Mississippi points. A number of Memphis firms own and operate mills in Mississippi and will thus get the benefit of the lower rates on their shipments to New Orleans for export. The principal firms here affected by the ruling are R. J. Darnell, Inc., with mills at Batesville and Leland, Miss.; the Belgrade Lumber Company, with mill at Isola, Miss.; Russe & Burgess, Inc., with mill at Isola; Taylor & Crate, with mill at Hoccliff and the Lamb-Fish Lumber Company, with mill at Charleston, Miss. A number of other firms here operate mills in Mississippi and it is estimated that the total saving in freight will be between \$15,000 and

GENERAL VIEW OF THE MAIN SAWMILL PLANT OF THE LAMB-FISH LUMBER COMPANY, CHARLESTON, MISS.

\$20,000 per annum. The new rates superseding the old will become effective February 15. The reduction amounts to 1 cent per hundred pounds from Mississippi points, the rates of 11 and 10 cents, respectively, being against the old rates of 12 and 11. Thus all hardwood rates are brought to the same basis as those on gum.

The issues involved in these cases have been fought out before the Interstate Commerce Commission several times. In 1904, the organization corresponding to the present Southern Hardwood Traffic Association, secured an order from the commission not only knocking out higher rates charged by the Illinois Central and Yazoo & Mississippi Valley roads but securing a refund of the alleged excessive rates paid. In 1913 there was another effort on the part of the same roads to put rates higher not only from Memphis but from all other intermediate points. The commission held at the time that these higher rates were reasonable. Its present ruling is therefore partly a maintenance of its former position and partly a rescinding of its former ruling. This is seen in the fact that Memphis rates are pronounced in the present case to be reasonable while those from intermediate points are reported unreasonable and are ordered reduced.

A conference was held in Chicago on December 28 between representatives of the Southern Hardwood Traffic Association and committees from the lumber organizations of Cincinnati, Louisville, St. Louis, Cairo and Chattanooga. Geo. D. Burgess, president of the association, and J. H. Townshend, secretary and general manager, were among those who went from Memphis. J. R. Walker, regular attorney of the Southern Hardwood Traffic Association, and Luther M. Walter, specially employed by the association, were both present. The idea of this conference was to go very carefully over the arguments to be presented by the Southern Hardwood Traffic Association in its contest with the railroads in the efforts of the latter to advance rates from points in the lower Mississippi valley to Ohio river crossings. This will come up for hearing at Memphis January 13 and indications are that it will be one of the most vigorous contests ever staged here. The lumbermen have been very carefully preparing their evidence and data for some time and, whatever may be the outcome, it is certain that the lumber people will not lose because of any lack of preparation or thoroughness on their part.

Lidgerwood Skidder at Burton-Swartz Operations

The Burton-Swartz Cypress Company has just completed its new mill at Perry, Fla. This building is of the latest steel construction, and plant will cover approximately seventy-five acres. It is equipped with complete up-to-date machinery, which is now installed, with boilers and power plant, and is ready to start work.

The first train of logs arrived the other day at the plant from Carbur. Carbur is the head of the logging operations conducted by the Carpenter-O'Brien Company and the Burton-Swartz Cypress Company. Carbur is situated seventeen miles south of Perry, with which it is connected by a branch of the Atlantic Coast Line Railroad. The Burton-Swartz Company operates its own trains over this branch line, the railroad company having built special yards at Carbur to receive and make up these trains.

The timber around Carbur is chiefly cypress, mixed with pine. The Burton-Swartz company is now logging this tract, and is taking off the cypress, using a Lidgerwood steel spar overhead skidder.

The photograph, which shows the skidder at work, also shows part of the town of Carbur, which has a population of about one thousand.

New Book on Timber Preservation

A book which deserves and will doubtless receive a place on the desks of those interested in the preservative treatment of timber has just come from the press of the McGraw-Hill Book Company, 239 West Thirty-ninth street, New York. The author is Howard F. Weiss, director of the government's Forest Products Laboratory, Madison, Wis.
